NOTICE OF MOTION
(Motion for Settlement Approval)

TAKE NOTICE THAT the plaintiffs will make a motion to the Honourable Madam Justice Aylen on September 19, 2022 to September 23, 2022, at 10:00 a.m. or as soon thereafter as the motion can be heard, in person as well as via video conference, at a location to be determined by the Court in advance of the hearing.

THE MOTION IS FOR:

1. a declaration that the final settlement agreement executed by the plaintiffs and the defendant on June 30, 2022 (the "**FSA**") is fair, reasonable and in the best interests of the class;

2. an order approving the FSA pursuant to Rule 334.29(1) of the *Federal Courts Rules*;

3. a declaration that the FSA is binding on the representative plaintiffs, on all class members, and on the defendant;

4. an order dismissing these proceedings against the defendant, without costs and with prejudice;

5. an order approving a $15,000 honorarium payment to each of the following representative plaintiffs:

    (a) Xavier Moushoom;

    (b) Jeremy Meawasige (by his litigation guardian, Jonavon Joseph Meawasige);

    (c) Zacheus Joseph Trout;

    (d) Ashley Dawn Louise Bach;

    (e) Melissa Walterson;

(f) Noah Buffalo-Jackson by his Litigation Guardian, Carolyn Buffalo;

(g) Carolyn Buffalo; and

(h) Dick Eugene Jackson also known as Richard Jackson;

6. an order that if the FSA is not approved, the parties are all restored, without prejudice, to their respective positions as such existed prior to the proposed settlement (*i.e.*, both the FSA and the parties' agreement in principle on compensation dated December 31, 2022 are null and void);

7. an order that the approval of the FSA is conditional on and does not become effective until an order is rendered by the Canadian Human Rights Tribunal ("**Tribunal**") in CHRT File T1340/7008 declaring that the FSA satisfies the compensation orders and framework for compensation made by the Tribunal regarding an overlapping part of the class; and

8. such further and other relief as counsel may request and this Honourable Court may deem just and appropriate.

THE GROUNDS FOR THE MOTION ARE:

1. This litigation involves the class proceeding bearing Court file Numbers T-402-19 and T-141-20 (the "**Consolidated Action**"), and the class proceeding bearing Court File Number T-1120-21 (the "**Trout Action**");

2. The litigation concerns discrimination by the defendant, Her Majesty in right of Canada, against the First Nations plaintiffs and class in the provision of child and family services between 1991 and 2022, and in denying, delaying and leaving service gaps in the provision of essential services between 1991 and 2017;

3. On November 26, 2021, the Federal Court certified the Consolidated Action as a class proceeding on consent on behalf of the following classes:

(a) ***Removed Child Class*** means all First Nations individuals who:

(i) were under the applicable provincial/territorial age of majority at any time during the Class Period; and

(ii) were taken into out-of-home care during the Class Period while they, or at least one of their parents, were ordinarily resident on a Reserve.

(b) ***Jordan's Class*** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who during the Class Period were denied a service or product, or whose receipt of a service or product was delayed or disrupted, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a jurisdictional dispute with another government or governmental department;

(c) ***Family Class*** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Removed Child Class and/or Jordan's Class;

4. On February 11, 2022, the Federal Court certified the Trout Action as a class proceeding on consent on behalf of the following classes:

(a) ***Child Class*** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who, during the Class Period, did not receive (whether by reason of a denial or a gap) an essential public service or product relating to a confirmed need, or whose receipt of said service or product

was delayed, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a service gap or jurisdictional dispute with another government or governmental department;

(b) ***Family Class*** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Child Class;

5. The parties engaged in exploratory settlement discussions, lengthy mediation, and intensive negotiations starting in 2019 and continuing until the date of signing the FSA, directly and with the assistance of eminent First Nations jurists, the Honourable Leonard Mandamin and the Honourable Murray Sinclair;

6. On December 31, 2021, the parties signed an agreement-in-principle, which laid the foundation for the parties' subsequent negotiations;

7. The agreement-in-principle included a global resolution of this litigation, as well as overlapping proceedings before the Tribunal;

8. In the agreement-in-principle, Canada agreed to pay $20 billion to settle all claims;

9. Following six more months of intensive negotiations, the parties signed the FSA on June 30, 2022;

10. The FSA is conditional on the approval of this Court pursuant to Rule 334.29 of the *Federal Courts Rules*;

11. The FSA contains, amongst other things, the following key terms:

(a) The claims process is designed with flexible standards, and is intended to be expeditious, cost-effective, user-friendly, culturally sensitive, trauma-informed, and non-traumatizing for claimants;

(b) Canada will pay $20 billion in compensation;

(c) The FSA allocates a budget of $7.25 billion to the Removed Child Class; $5.75 billion to the Removed Child Family Class; $3 billion to the Jordan's Principle Class and $2 billion to the Trout Child Class; and a fixed budget of $2 billion to the Jordan's Principle Family Class and Trout Family Class;

(d) In the event of a surplus, the FSA allows for the possibility of transferring funds to other classes except the Jordan's Principle Family Class and Trout Family Class, with priorities favouring the children;

(e) Anticipated payouts to each of the classes are expected to be at the following ranges:

i. **Removed Child Class**: Base compensation of $40,000 plus enhanced compensation accounting for factors such as age at removal, time spent in care, age when existing care, and number of placements (or spells in care);

ii. **Removed Child Family Class**: caregiving parents and caregiving grandparents receive direct compensation (estimated to be between $40,000 and $60,000), while siblings and non-caregiving parents and grandparents are ineligible for compensation but may indirectly benefit from the Cy-près Fund;

iii. **Jordan's Principle Class**: class members are divided into two categories based on the level of impact on them as a result of the discrimination: those who suffered less impact in the Jordan's Principle Class receive up to $40,000, while those who suffered greater harm will receive a minimum of $40,000;

iv. **Trout Child Class**: class members are divided into two categories based on the level of impact on them as a result of the discrimination: those who suffered less impact in the Jordan's Principle Class will receive up to $20,000, while those who suffered greater impact will receive a minimum of $20,000;

v. **Jordan's Principle Family Class and Trout Family Class**: only the caregiving parents and caregiving grandparents of the children in the Jordan's Principle Class and Trout Child Class who suffered greater impact may receive compensation at a level to be determined once actuarial information is available—while siblings and other parents and grandparents are ineligible for compensation but may indirectly benefit from the Cy-près Fund;

(f) The FSA allows the estates of the deceased members of the Removed Child Class, Jordan's Principle Child Class, and Trout Child Class to file a claim for compensation on behalf of the deceased child;

(g) The Cy-près Fund established under the FSA will have a $50 million endowment to primarily benefit class members who do not receive direct payments under the FSA;

(h) The FSA ensures that culturally appropriate and trauma-informed supports are available to claimants, including, amongst others, emotional and mental wellbeing support, administrative and claims process support, legal support, and financial protections support;

12. The FSA is conditional on the Tribunal confirming the satisfaction of its Compensation Order (2019 CHRT 39) and the Compensation Framework Order (2021 CHRT 7);

13. The FSA has been the subject of extensive consultation by the AFN with First Nations regions, communities and leadership across the country;

14. The settlement amount presents a reasonable settlement in light of the existing data and the class size estimates feasible before a claims process begins;

15. The representative plaintiffs support the FSA and experienced class counsel recommend it;

16. The FSA reflects some compromises in light of the following:

(a) the risks associated with litigation concerning historical events, with class periods spanning decades;

(b) limitations risks with respect to some causes of action;

(c) cause of action risks associated with respect to the Trout Action, noting Canada's previous resolve to fight that class;

(d) the risks of delays associated with complex, national litigation, including potential appeals, and motions;

(e) the hardship and re-traumatization that class members would face during potential individual damages assessment hearings;

(f) the class being primarily composed of First Nations youth already exposed to trauma;

(g) the defendant is well resourced, and could litigate to their fullest both the class proceedings, and any potential individual damages assessments; and

(h) the risk, however remote, of legislative abrogation of some or all of the claims;

17. The FSA provides expeditious recovery for class members;

18. The FSA is fair, reasonable, and in the best interests of the class;

19. Notices of certification and settlement approval hearing has been given in accordance with the notice plan approved by the Court;

20. This motion is made on consent and by agreement of the plaintiffs and the defendant;

21. The FSA is conditional upon this Court approving the agreement in its current form and without modification;

22. Rule 334.29(1) of the *Federal Courts Rules*, SOR/98-106;

23. *Federal Courts Act*, R.S.C., 1985, c. F-7; and

24. Such further and other grounds as counsel may advise.

THE FOLLOWING DOCUMENTARY EVIDENCE will be used at the hearing of the motion:

1. The Affidavit of Xavier Moushoom, sworn August 23, 2022;

2. The Affidavit of Jonavon Joseph Meawasige, sworn September 1, 2022;

3. The Affidavit of Zacheus Joseph Trout, sworn September 2, 2022;

4. The Affidavit of Melissa Walterson, affirmed September 6, 2022;

5. The Affidavit of Ashley Dawn Louise Bach, affirmed September 6, 2022;

6. The Affidavit of Karen Osachoff, affirmed September 5, 2022;

7. The Affidavit of Carolyn Buffalo, to be affirmed;

8. The Affidavit of Dick Eugene Jackson also known as Richard Jackson, to be affirmed;

9. The Affidavit of Janice Ciavaglia, affirmed September 6, 2022;

10. The Affidavit of William Colish, affirmed September 2, 2022;

11. The Affidavit of Dr. Lucyna Lach, sworn September 6, 2022;

12. Such further and other evidence as counsel may advise and this Honourable Court may permit.

COUR FÉDÉRALE
ACTION COLLECTIVE PROPOSÉE

ENTRE:

L'ASSEMBLÉ DES PREMIÈRES NATIONS, ASHLEY DAWN LOUISE BACH, KAREN OSACHOFF, MELISSA WALTERSON, NOAH BUFFALO-JACKSON par son tuteur légal, Carolyn Buffalo, CAROLYN BUFFALO et DICK EUGENE JACKSON également connu comme étant RICHARD JACKSON

Demandeurs

et

SA MAJESTÉ LA REINE
Représenté par LE PROCUREUR GÉNÉRAL DU CANADA

Défendeur

Je, Xavier Moushoom, travailleur pour les services de transport médicaux de la Réserve des Premières Nations du Lac-Simon, région de l'Abitibi-Témiscamingue, province de Québec, AFFIRME SOLENNELLEMENT QUE :

1. Je suis un des demandeurs-représentants dans les Actions collectives consolidées portant les numéros de cour T-402-19 (l'Action collective **Moushoom** ») et T-141-20 (l'Action collective de « **L'Assemblée des Premières Nations** ») (collectivement les « **Actions collectives consolidées** »).

A. Mon enfance avant d'être séparé de ma famille

2. Je suis né en 1987 au Lac-Simon et je suis membre de la Nation Anishinaabe.

3. Mes deux parents sont des survivants des pensionnats autochtones.

4. Leurs expériences aux pensionnats autochtones ont eu des effets dévastateurs sur eux, mais nous n'en parlions pas à la maison parce que c'était un sujet tabou pour eux.

5. Mes deux parents combattaient leurs propres démons durant ma jeunesse et les deux ont souffert d'alcoolisme.

6. En raison de son alcoolisme et des soins qu'il recevait à Montréal, mon père fut absent durant ma jeunesse. D'ailleurs, mon père, qui a passé une bonne partie de sa vie à Montréal sans domicile fixe, y est décédé.

7. J'ai habité chez ma mère sur la réserve du Lac-Simon, avec mon frère aîné Nick de ma naissance jusqu'en 1995.

8. Je faisais partie d'une belle communauté où je pouvais pratiquer les traditions de ma nation; je pratiquais la pêche et la trappe, et j'allais en forêt pour m'y ressourcer.

9. J'y apprenais les enseignements de la culture traditionnelle ancestrale de ma communauté, si chère à ma Nation.

10. Pendant ma jeunesse, je parlais couramment l'algonquin avec ma grand-mère et plusieurs autres personnes et j'en étais fière.

B. La séparation initiale de ma famille

11. En 1996, j'ai été retiré de ma famille d'origine pour être placé dans une famille d'accueil, au Lac-Simon. À ce jour, je ne connais toujours pas la raison ayant mené à mon retrait de la maison familiale.

12. Mon frère Nick a aussi été retiré de notre maison pour être placé dans une famille d'accueil différente, l'isolant davantage du reste de la famille et m'isolant davantage de lui.

13. Ceci a déchiré notre famille. Nous ne savions pas pourquoi nous devions être séparés. Par la suite, très souvent je me suis demandé si ma famille ne voulait tout simplement plus de moi.

C. Mon expérience en famille d'accueil

14. Un an plus tard, en 1997, j'ai été placé dans une nouvelle famille d'accueil, cette fois-là à Val-d'Or, soit à l'extérieur de ma communauté.

15. Dorénavant, non seulement je n'étais plus dans ma maison familiale, mais j'étais retiré de ma communauté, me trouvant à des endroits où personne ne partageait ma langue, mes traditions et ma culture.

16. De 9 à 18 ans, j'ai été enlevé et placé dans pas moins de quatorze (14) familles d'accueil différentes à Val-d'Or;

17. Dès le début, je me sentais perdu et totalement déstabilisé. Je ne connaissais personne dans les familles qui m'accueillaient. En même temps, je devais vivre comme eux et adopter leurs traditions et cultures.

18. Au cours de cette période de grande instabilité, j'ai progressivement perdu ma langue maternelle algonquienne, ma culture et mes liens avec les membres de ma communauté du Lac-Simon. En bref, on m'a déraciné tout comme ce fut le cas pour mes parents lorsqu'ils ont été placés dans des pensionnats autochtones.

19. Durant cette période, j'ai eu très peu de contact avec ma mère. À chaque fois que je désirais la visiter, je devais supplier la travailleuse sociale et lui démontrer que je méritais une telle visite. Qu'à cela ne tienne, je ne me voyais accorder qu'un accès très limité à ma mère.

20. Je me suis ainsi retrouvé à l'âge de 18 ans sans savoir qui j'étais, sans savoir comment vivre et pratiquer ma culture ni comment parler ma langue, et n'ayant aucune idée quant à la façon de me réintégrer dans la communauté et dans la nation au sein desquelles je suis né et desquelles j'ai été retiré.

D. Ma sortie du système de placement

21. À 18 ans, on m'a annoncé que je devais quitter ma famille d'accueil, puisque l'aide financière cessait à l'âge de la majorité.

22. À cette époque, je me sentais complètement perdu et mal outillé pour affronter les prochaines étapes de ma vie. J'ignorais où j'allais vivre, où était ma place en société et ce que j'allais faire.

23. Je souhaitais rester avec ma famille d'accueil afin de mieux me préparer à une transition de retour dans ma communauté, mais cela s'avérait impossible vu l'absence d'aide financière. La famille a néanmoins accepté de me laisser rester avec eux pendant trois mois additionnels, après quoi j'ai dû survivre par mes propres moyens.

E. Les impacts à long terme de mon expérience en famille d'accueil

24. Dans les années qui ont suivi, j'ai développé des problèmes de dépendance que j'ai fini par surmonter grâce à ma propre détermination et avec l'aide des membres de ma communauté.

25. Je comprends aujourd'hui que ma jeunesse perturbée et les problèmes qui en découlent ont été causés par la faute du défendeur de ne pas s'être assuré qu'il existait des ressources adéquates pour répondre aux problèmes de ma famille.

26. Bien que je n'aie reçu aucune aide pour réparer ma jeunesse brisée et tumultueuse, je me suis engagé à réapprendre ma langue et à suivre les enseignements d'un aîné de la Nation afin de reconnecter avec ma culture.

27. En plus de mon frère aîné Nick, j'ai deux frères plus jeunes qui ont été placés dans des familles d'accueil à l'extérieur du Lac-Simon. L'un d'eux, Delphis, a été placé dans une famille dans la ville de La Sarre, au Québec (environ 2h30 de route de chez nous). Tragiquement, il est décédé l'an dernier sans qu'il n'ait pu retourner au Lac-Simon et vivre avec notre mère.

28. J'ai pris comme mission personnelle, et au nom de ma mère, de réunir Delphis avec sa famille. J'ai tout fait pour qu'il puisse nous visiter, malgré les difficultés avec les services sociaux, avec le but ultime de le ramener au Lac-Simon.

29. Cette lutte a pris tellement de mon énergie, et je voyais que c'était difficile pour Delphis aussi, car il aimait sa famille d'accueil. Cette expérience a démontré pour moi que même quand un enfant est placé dans une famille qu'il aime, ça le place dans une situation déchirante et impossible vis-à-vis de sa famille biologique.

30. L'impact de la perte de mon frère et de mon père a été gravement exacerbé par le fait d'être séparé de ma famille. Les familles de mon peuple ne devraient jamais avoir à souffrir sous un tel système discriminatoire.

31. Aujourd'hui, je travaille pour les services de transport médical au Lac-Simon et j'ai retrouvé une certaine stabilité dans ma vie, bien que je fasse toujours mon deuil et que je demeure avec un traumatisme et des cicatrices psychologiques laissés par le retrait de ma maison familiale, de ma communauté, de ma langue et de ma culture.

F. Mon implication à titre de Demandeur représentant

32 Je suis victime de la conduite reprochée du défendeur et je suis membre du Groupe vivant sur une réserve, tel que défini à l'entente finale de règlement intervenu dans les Actions collectives consolidées le 30 juin 2022 (le « **Règlement Final** »).

33 J'ai déjà parlé publiquement de mon expérience en famille d'accueil devant la Commission d'enquête publique relativement aux relations entre les peuples autochtones et certains services publics au Québec (la « Commission Viens »).

34. Je considère que j'ai droit à une indemnisation pour les préjudices subis en lien avec la conduite reprochée et que tous les membres des Actions collectives consolidées méritent également une indemnisation.

35. J'ai accepté d'être le représentant de l'Action collective Moushoom non seulement afin d'obtenir justice pour moi-même, mais surtout afin de permettre aux milliers d'enfants et membres de leurs familles d'être indemnisés le plus rapidement possible pour les dommages soufferts en raison de la conduite du défendeur.

36. Je souhaite également que le système de placement des enfants change en mieux le plus rapidement possible au bénéfice des enfants d'aujourd'hui et des générations futures.

37. Je me suis investi corps et âme pour que ce dossier soit mené à bien de la manière la plus bénéfique pour les membres du groupe que je représente.

38. J'ai été impliqué et j'ai discuté depuis le début du dossier avec mes avocats, en leur donnant instruction de procéder le plus rapidement possible pour que les membres des Actions collectives consolidées obtiennent justice, soit par la voix d'un règlement négocié ou d'un jugement.

39. Je me suis déplacé (en autobus puisque je n'ai pas d'automobile et que je ne prends pas l'avion) à plusieurs reprises pour aller rencontrer mes avocats à Montréal (qui est à près de 500 kilomètres de chez moi). Autrement, ce sont eux qui se sont déplacés à plusieurs reprises pour me rencontrer à Louvicourt, où j'habite, près de Lac-Simon.

40. De plus, nous avons tenu d'innombrables conférences téléphoniques et rencontres virtuelles, en plus de communiquer par courriel et par message texte, et ce, n'importe quel jour de la semaine ou de la fin de semaine, de jour comme de soir.

41. J'ai expliqué aux membres qui me l'ont demandé le but des Actions collectives consolidées.

42. J'ai accepté que l'Action collective Moushoom soit jointe à celle de L'Assemblé des Première Nations puisque cela était dans l'intérêt des membres du groupe que je représente.

43. Quand des négociations pour régler les Actions collectives consolidées ont débuté, je les ai autorisées, puisque cela était dans l'intérêt supérieur de tous les membres.

44. Depuis le début de ces discussions, j'ai été tenu au courant de celles-ci, et ce, à toutes les étapes.

45. J'ai participé à une session de médiation avec l'honorable juge Mandamin et j'y ai même pris la parole devant tous les participants, expliquant ce que la discrimination que j'ai subie m'a causé comme séquelles. Puisque tous les autres participants

parlaient anglais, des traducteurs se sont assuré de traduire simultanément ces échanges en français.

46. Mes avocats m'ont fait rapport sur une base régulière de l'avancement de ces négociations.

47. Lorsqu'un règlement de principe est intervenu pour la somme de 20 milliards de dollars pour les membres des Actions collectives consolidées, je l'ai considéré comme un précédent historique pouvant mettre un terme à des décennies de discrimination envers les personnes des Premières Nations.

48. J'ai été extrêmement fier de ce règlement de principe, ainsi que du Règlement Final qui s'en est suivi (non sans mal) et que je demande maintenant à la Cour d'approuver.

49. Ce règlement met fin immédiatement aux Actions collectives consolidées, évitant d'avoir à débattre encore des années de la responsabilité du défendeur, tout en évitant aussi le risque d'un jugement défavorable.

50. Ce règlement m'a été expliqué par mes avocats et mis en contexte avec les diverses ordonnances d'indemnisations rendues par le Tribunal Canadien des Droits de la Personne (TCDP) dans un dossier parallèle, dont l'Assemblé des Premières Nations (qui est également favorable au présent règlement) est une des parties demanderesses.

51. Il m'est apparu évident que le présent règlement allait de pair avec ces diverses ordonnances du TCDP et qu'il permettait également de mettre un terme immédiatement et de manière favorable à cet autre recours qui s'annonçait autrement encore très long à finaliser, considérant l'appel du défendeur devant la Cour Fédéral d'appel et, possiblement, à la Cour Suprême du Canada, ce qui aurait eu pour effet de priver de très nombreuses victimes d'une compensation concrète et immédiate (voir aucune compensation si les ordonnances du TCDP étaient cassées en appel).

52. Le Règlement Final permet ainsi une juste balance et accorde une indemnisation immédiate et proportionnelle aux torts causés, tout en victimisant le moins possible les membres des Actions collectives consolidées.

53. Mon but en acceptant d'être représentant pour cette action collective était de tenter de clore un chapitre noir dans le traitement des jeunes des Premières Nations au Canada et il était alimenté par l'espoir qu'on ne répétera pas les erreurs commises dans le passé. Le Règlement Final, tant pour le volet indemnisation que pour celui visant les réformes à long terme, concrétise ce double but, et c'est pourquoi je considère si important que la Cour l'approuve sans plus attendre.

54. En conséquence, je n'ai aucune réserve à approuver le Règlement Final historique d'un montant inégalé dans les annales Canadienne et de demander à la Cour de l'approuver.

G. Indemnisation du représentant

55. Considérant mon implication à titre de représentant et basé sur ce dont mes avocats m'ont informé, il appert que je pourrais avoir droit à une indemnisation pour le rôle que j'ai joué dans les Actions collectives consolidées si le Règlement Final est approuvé.

56. Bien que ce n'était absolument pas un des buts de ma démarche en acceptant d'être représentant de l'Action collective Moushoom, et laissant le tout à l'entière discrétion de la Cour, j'ai été informé qu'un montant de 15 000$ (actualisé) représente plus ou moins la moyenne des indemnisations accordées, à titre d'honoraire, aux représentants dans des dossiers de nature similaires, dont ceux des Pensionnats autochtones, de la Rafle des années soixante et des Externats autochtones, lesquels furent tous réglés par le biais d'une action collective.

57. Mes avocats m'ont expliqué que de telles indemnités avaient été accordées aux représentants pour différents motifs, dont le fait qu'ils avaient accepté de mettre de l'avant leurs cas personnels publiquement au bénéfice des membres du groupe; qu'ils avaient dû revivre les traumatismes subis pour faire avancer le dossier pour les membres du groupe; qu'ils s'étaient personnellement impliqués auprès des membres pour faire connaitre le dossier à toutes les étapes de celui-ci; qu'ils avaient étroitement collaboré avec les avocats tout au long du processus judiciaire; et qu'ils étaient prêts à témoigner et à être contre-interrogés au procès si nécessaire.

58. Considérant le contenu de la présente déclaration solennelle qui fait écho à tous ces critères, et si la Cour le juge approprié dans les circonstances, je me permets de demander une telle indemnité de 15 000$, pourvu que cela ne réduise pas les montants autrement payables aux membres des Actions collectives consolidées.

59. Je n'ai aucun conflit avec les membres des groupes et j'agis de bonne foi et avec le désir de faire valoir mes droits et ceux des groupes consolidés.

AFFIDAVIT OF JONAVON JOSEPH MEAWASIGE
(Sworn September 1, 2022)

I, Jonavon Joseph Meawasige, of the Pictou Landing First Nation in Nova Scotia, currently resident in Edmonton, Alberta, SWEAR THAT:

1. I am a representative plaintiff, and the brother and litigation guardian of another representative plaintiff, Jeremy Meawasige, in this class action. As such, I have personal knowledge of the matters that I depose to in this affidavit. Where the source of information is other than my personal knowledge, I say so and I believe that information to be true.

2. In this affidavit, I explain why I support the proposed settlement reached with Canada, both on my behalf and on behalf of my brother.

My Brother, Jeremy Meawasige

3. Jeremy is my younger brother. He lives on the Pictou Landing First Nation Reserve. I have been involved in his care since he was born.

4. Jeremy's circumstances are described in the Federal Court's decision in *Pictou Landing Band Council v. Canada (Attorney General)*, 2013 FC 342: "a teenager with multiple disabilities and high care needs. He has been diagnosed with hydrocephalus, cerebral palsy, spinal curvature and autism. Jeremy can only speak a few words and cannot walk unassisted. He is incontinent and needs total personal care including showering, diapering, dressing, spoon feeding, and all personal hygiene needs. He can become self-abusive at times, and needs to be restrained for his own safety."

5. As a result, Jeremy needed essential services. Canada refused to pay for those services to him. My mother had to go to Federal Court to ask for a judicial review of

Canada's refusal. On April 4, 2013, the Court found that Canada's refusal to pay for the essential services that Jeremy needed violated Jordan's Principle, and ordered Canada to pay for the essential services that Jeremy needs.

Our Late Mother, Maurina Beadle

6. Throughout her life, our late mother, Maurina Beadle, cared for Jeremy. She refused to give him up to the child welfare system or allow him to be institutionalized away from home to receive the services he needed. Despite her own fragile health, our mother cared and fought for Jeremy and Jordan's Principle until the end of her life.

7. She was Jeremy's litigation guardian in this class action. She swore an Affidavit on May 8, 2019. Attached as **Exhibit "A"** is a copy of her affidavit. She was appointed litigation guardian for Jeremy by order of the Court dated May 28, 2019. Attached as **Exhibit "B"** is a copy of that order without Schedule "A".

8. Sadly, our mother had a stroke and passed away on November 13, 2019. She was laid to rest in Pictou Landing on November 18, 2019.

My Role in the Class Action

9. I have been involved in this lawsuit from the beginning, and have taken significant time to meet and speak to class counsel, and to understand the factual and legal matters involved in this litigation.

10. After our mother passed away, I decided to step in to ensure that Jeremy was able to continue acting as a representative plaintiff for the Jordan's Principle Class. I want Jeremy, and First Nations youth like him, to have the supports that they need to have a meaningful and dignified life.

11. As Jeremy's brother, I also volunteered to be a representative plaintiff for the class of family members of the First Nations individuals whose Jordan's Principle rights have been violated.

12. The Court appointed me as Jeremy's representative and litigation guardian on July 7, 2021. Attached as **Exhibit "C"** is the order of Madam Justice St-Louis without schedules.

13. On November 26, 2021, Madam Justice Aylen certified the class action and appointed both Jeremy and me as representative plaintiffs. Attached as **Exhibit "D"** is the order of Madam Justice Aylen without schedules.

My Work on the Class Action

14. Through my mother, I was informed of and indirectly involved in her 2013 application to the Federal Court about Jordan's Principle. That application reaffirmed First Nations' equality rights to essential services, and advanced Jordan's Principle.

15. Toward the beginning of this class action, I met in person with David Sterns and Mohsen Seddigh of Sotos LLP, who explained the class action to me. I travelled to Toronto with my mother for that first meeting.

16. Ever since then, I have routinely spoken on the phone, by text messaging and email with Mr. Seddigh about the progress of the case and I have given him my feedback and instructions about important decisions on the case.

17. I attended the mediation with the Honourable Mr. Mandamin a few times and spoke about my family's experience with Jordan's Principle and Canada's discrimination. It was extremely hard for me to speak about these things in front of many people, but I wanted my family's story to be heard. Remembering and speaking

about my family's challenges is difficult for me, but I have shared it in this case, hoping that it will help prevent other kids and families from going through the same thing.

18. I have also reviewed the documents that class counsel sent me and provided feedback during this class action. These included documents such as the Consolidated Statement of Claim, my affidavits, the Court's orders, and settlement materials. I swore an affidavit in support of the motion for certification and to add me as Jeremy's litigation guardian.

19. When I requested that the Court appoint me and Jeremy as representative plaintiffs, I understood and explained my responsibilities. I have taken these responsibilities seriously and tried to the best of my ability to fairly and adequately represent the class, both for myself and on behalf of Jeremy.

20. Earlier this month, I travelled to Toronto to meet with class counsel, my co-representative plaintiff, Zacheus Joseph Trout (and his wife, Veronica Trout), and with the team's expert working on Jordan's Principle, Dr. Lucyna Lach, who was joining us from Montreal. We had a long discussion. Dr. Lach asked for my feedback and my personal experience with Jordan's Principle, and I shared my personal experience and my thoughts about the claims process with her.

21. I was happy to hear Dr. Lach describe to us the method that the experts were developing for the Jordan's Principle claims process to determine who was impacted more significantly by the discrimination.

22. I believe that compensation should be proportional to the suffering that each person experienced. I do not think it would be fair for everyone to receive the same compensation regardless of their circumstances. I think that would ignore the suffering

of First Nations people like my mother and Jeremy. So I support the experts' work that Dr. Lach described to us.

Settlement Agreement

23. For over a year, we were in mediation and negotiations with Canada. I personally attended some sessions. Every time when we were getting close to a resolution, Mr. Seddigh would send me the settlement documents and after I had a chance to review, we would discuss the details and I would give him my instructions.

24. I was thrilled with the agreement in principle that was signed late last year. I spoke to the media about it (https://www.aptnnews.ca/featured/plaintiffs-skeptical-but-hopeful-about-proposed-child-welfare-settlement/) to spread the word so claimants could know that compensation was finally coming.

25. Speaking with Mr. Seddigh, I kept informed of the intensive negotiations after the agreement in principle was signed. I reviewed the draft of the settlement agreement and discussed it with Mr. Seddigh who explained it to me. I agreed with the agreement and instructed him to sign it. All parties finally signed the settlement agreement on June 30, 2022.

26. I wholeheartedly support this settlement agreement, which I understand is the largest settlement in Canada's history. I support the principles that the agreement embodies. Some of these principles are:

(a) The claims process aims to minimise the risk of causing trauma to class members;

(b) There will be no interview or in-person examination of claimants;

(c) The claims process avoids subjective assessments of harm and individual trials; and

(d) The claims process uses objective criteria to assess class members' needs and circumstances.

27. The settlement agreement divides Jordan's Principle claimants into two groups: those who suffered more significant impact as a result of the discrimination, and those who suffered less impact than the first group. This way the settlement agreement is able to ensure that those who suffered more will receive at least $40,000 in compensation. Everyone else receives compensation of up to $40,000 but not more than that. I agree with this division because it gives more compensation to those who have experienced more impact, and responsibly divides the $3 billion budget for the Jordan's Principle Class.

28. I instructed my counsel to sign the settlement agreement and I support it even though as a brother in the Jordan's Principle Family Class, I personally will not receive direct compensation under the settlement agreement. This case has always been about the children first. I am proud of the life changing compensation that this settlement will provide to tens of thousands of First Nations children who suffered discrimination.

Honorarium

29. I do not wish to ask for an honorarium for myself. As I said before, I have done this case to continue my mother's fight for justice and to make sure Jeremy and First Nations youth like him are well and that their needs are met.

30. As litigation guardian for Jeremy, I do wish to ask the Court to grant an honorarium to Jeremy to recognize his remarkable contribution to this case and to Jordan's Principle. If the Court grants Jeremy an honorarium, my intention is to keep that money in his account so it can be spent on things that he may need or make him happy.

Class Counsel

31. As I described earlier, I have been actively engaged with class counsel through Sotos LLP throughout this process. I am very happy with their work on this class action.

32. I signed an agreement with Sotos LLP about fees and disbursements. This retainer agreement says that class counsel will only be paid if they are successful at obtaining a judgment or settlement with Canada. The retainer agreement says that class counsel's fees will be taken from the settlement amount based on some percentages to be reviewed and approved by the Court.

33. Instead of pursuing the arrangement in the retainer agreement, class counsel have agreed to separately negotiate their fees directly with Canada and be paid over and above the settlement amount. This means that class counsel's fees will not be deducted from the $20 billion settlement amount. I fully support this plan because it does not decrease the money that is available to pay compensation to class members.

34. Mr. Seddigh advises me and I believe that class counsel have not yet negotiated their fees with Canada.

AFFIDAVIT OF MAURINA BEADLE
(Sworn May 8th, 2019)

I, Maurina Beadle, of the Pictou Landing First Nation in Nova Scotia, SWEAR THAT:

1. I am the mother of Jeremy Meawasige and his proposed litigation guardian in this lawsuit. As such, I have personal knowledge of the matters that I depose to in this affidavit. Where the source of information is other than my personal knowledge, I say so and I believe that information to be true.

2. In this affidavit, I explain why I should be appointed as my son's litigation guardian.

3. I live with Jeremy on the Pictou Landing Indian Reserve in Nova Scotia. I am one of the elders of my community.

4. Jeremy was born on December 9, 1994. He is under a legal disability and incapable of managing his own affairs. He has been diagnosed with hydrocephalus, cerebral palsy, spinal curvature and autism. He can only speak a few words and cannot walk unassisted. He is incontinent and needs total personal care including showering, diapering, dressing, spoon feeding, and all personal hygiene needs. He can become self-abusive at times, and needs to be restrained for his own safety.

5. As a result, Jeremy is not able to appreciate the legal process or provide his counsel with instructions.

6. I have been Jeremy's primary caregiver throughout his life. I am closer to him than anyone else. I cared for him in our home without any support or assistance until 2010 when I suffered a stroke. The stroke left me physically unable to continue to care for Jeremy without assistance. I therefore needed help to be able to look after him.

7. The Government of Canada refused to provide care to Jeremy. We had to go to the Federal Court to argue that, under Jordan's Principle, Canada should pay for the services that Jeremy needed. I was an applicant in that proceeding together with the Pictou Landing Band Council. On April 4, 2013, the Court found that Canada's refusal to pay for the services violated Jordan's Principle.

8. I was awarded the Queen's Diamond Jubilee for my care for Jeremy and his progress, and for my efforts to uphold Jordan's Principle.

9. I have appointed the law firms of Sotos LLP, Kugler Kandestin LLP and Miller Titerle + Co. as counsel for Jeremy in this proposed class action. I have met with David

Sterns and Mohsen Seddigh, lawyers from Sotos LLP, who explained the class action to me.

10. I have no interest in the proceeding adverse to that of Jeremy.

11. I have been advised by Mr. Seddigh and believe that, other than under exceptional circumstances, generally no costs may be awarded against a party to a class proceeding in the Federal Court.

ORDER
(Consolidated, Leave to Commence Actions, and other Relief)

UPON MOTION, by the plaintiffs for an Order:

(a) granting leave *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 under this Court's Order dated May 28, 2019 in Court File No. T-402-19 ("**Preclusion Order**") to commence the proposed class proceeding in Court File No. T-141-20;

(b) consolidating the actions in Court File No. T-402-19 and Court File No. T-141-20 ("**Consolidated Proceeding**");

(c) adding Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson as plaintiffs to the Consolidated Proceeding;

(d) appointing Jonavon Joseph Meawasige as representative and litigation guardian for the plaintiff Jeremy Meawasige;

(e) appointing Carolyn Buffalo as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson;

(f) granting leave to serve and file the Consolidated Statement of Claim in the Consolidated Proceeding substantially in the form enclosed as **Schedule "A"** hereto;

(g) amending the style of cause in the Consolidated Proceeding accordingly, as drafted in Schedule "A" hereto;

(h) stating that the removal of the Jordan's Class members and corresponding Family Class members with claims dated between April 1, 1991 and December 11, 2007 in Court File No. T-402-19 and/or Court File No. T-141-20 from the Consolidated Proceeding is without prejudice to those class members' rights to commence a new action and to advance any arguments available to them notwithstanding this Order and notwithstanding the Consolidated Proceeding;

(i) granting the Assembly of First Nations ("**AFN**") and Zacheus Joseph Trout leave under the Preclusion Order to commence a proposed class action on behalf of the class members whose claims are separated from the Consolidated Proceedings as particularized in the draft claim substantially in the form enclosed as **Schedule "B"** hereto ("**Separated Proceeding**");

(j) stating that this Order is without prejudice to the defendant's right to contest certification and/or defend against the claims in the Separated Proceeding as it would have been immediately prior to the issuance of this Order, subject to paragraph (h), above;

(k) extending the Preclusion Order to:

i. the Consolidated Proceeding in Schedule "A" from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

ii. the Separated Proceeding from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel;

(l) and other relief;

AND UPON being advised that the defendant consents in whole to the motion as filed;

AND UPON hearing amicus curiae and counsel's submissions;

AND UPON being satisfied of the appropriateness of the relief sought:

1. **THIS COURT ORDERS** that leave is granted *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 to commence the proposed class proceeding in Court File No. T-141-20.

2. **THIS COURT ORDERS** that the actions in Court File No. T-402-19 and Court File No. T-141-20 are consolidated.

3. **THIS COURT ORDERS** that Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson are added as plaintiffs to the Consolidated Proceeding.

4. **THIS COURT ORDERS** that Jonavon Joseph Meawasige is appointed as representative and litigation guardian for the plaintiff Jeremy Meawasige.

5. **THIS COURT ORDERS** that Carolyn Buffalo is appointed as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson.

6. **THIS COURT ORDERS** that leave is granted to serve and file the Consolidated Statement of Claim substantially in the form enclosed as Schedule "A" hereto.

7. **THIS COURT ORDERS** that the style of cause of the Consolidated Proceeding is amended accordingly, as drafted in Schedule "A".

8. **THIS COURT ORDERS** that the separation of the claims in the Separated Proceeding from the Consolidated Proceeding is without prejudice to the rights of the class members in the Separated Proceeding to commence a new action and to advance any arguments available to them immediately prior to the issuance of this Order, notwithstanding this Order and notwithstanding the Consolidated Proceeding.

9. **THIS COURT ORDERS** that leave is granted to the plaintiffs AFN and Zacheus Joseph Trout to commence a proposed class action on behalf of the Separated Classes substantially in the form enclosed as Schedule "B" hereto.

10. **THIS COURT ORDERS** that this Order is without prejudice to the defendant's rights to contest certification and defend against the Separated Proceeding, subject to paragraph 8 of this Order.

11. **THIS COURT ORDERS** that this Court's Order dated May 28, 2019 in Court File No. T-402-19, which precludes the commencement of another proposed class proceeding in this Court in respect of the allegations in this proceeding without leave of the Court, be and is extended and shall apply to:

(a) the Consolidated Proceeding in Schedule “A” as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

(b) the Separated Proceeding as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel.

"Martine St-Louis"
Judge

This is Exhibit “D” referred to in the Affidavit of Jonavon Joseph Meawasige of the Pictou Landing First Nation in Nova Scotia, currently resident in Edmonton, sworn before me at the City of Toronto, in the Province of Ontario on September 1, 2022, in accordance with O. Reg. 431/20, Administering Oath or Declaration Remotely.

Commissioner for Taking Affidavits (or as may be)

LSO: 81458L

Federal Court Cour fédérale

Date: 20211126

Docket: T-402-19
T-141-20

Citation: 2021 FC 1225

Ottawa, Ontario, November 26, 2021

PRESENT: The Honourable Madam Justice Aylen

CLASS PROCEEDING

BETWEEN:

XAVIER MOUSHOOM, JEREMY MEAWASIGE (by his litigation guardian, JONAVON JOSEPH MEAWASIGE) AND JONAVON JOSEPH MEAWASIGE

Plaintiffs

and

THE ATTORNEY GENERAL OF CANADA

Defendant

BETWEEN:

ASSEMBLY OF FIRST NATIONS, ASHLEY DAWN LOUISE BACH, KAREN OSACHOFF, MELISSA WALTERSON, NOAH BUFFALO-JACKSON (by his litigation guardian, CAROLYN BUFFALO), CAROLYN BUFFALO AND DICK EUGENE JACKSON also known as RICHARD JACKSON

Plaintiffs

and

HER MAJESTY THE QUEEN

AS REPRESENTED BY THE ATTORNEY GENERAL OF CANADA

Defendant

ORDER AND REASONS

UPON MOTION by the Plaintiffs, on consent and determined in writing pursuant to Rule 369 of the *Federal Courts Rules*, for an order:

(a) Granting the Plaintiffs an extension of time to make this certification motion past the deadline in Rule 334.15(2)(b);

(b) Certifying this proceeding as a class proceeding and defining the class;

(C) Stating the nature of the claims made on behalf of the class and the relief sought by the class;

(d) Stipulating the common issues for trial;

(e) Appointing the Plaintiffs specified below as representative plaintiffs;

(f) Approving the litigation plan; and

(g) Other relief;

CONSIDERING the motion materials filed by the Plaintiffs;

CONSIDERING that the Defendant has advised that the Defendant consents in whole to the motion as filed;

CONSIDERING that the Court is satisfied, in the circumstances of this proceeding, that an extension of time should be granted to bring this certification motion past the deadline prescribed in Rule 334.15(2)(b);

CONSIDERING that while the Defendant's consent reduces the necessity for a rigorous approach to the issue of whether this proceeding should be certified as a class action, it does not relieve the Court of the duty to ensure that the requirements of Rule 334.16 for certification are met [see *Varley v Canada (Attorney General)*, 2021 FC 589];

CONSIDERING that Rule 334.16(1) of the *Federal Courts Rules* provides:

Subject to subsection (3), a judge shall, by order, certify a proceeding as a class proceeding if	Sous réserve du paragraphe (3), le juge autorise une instance comme recours collectif si les conditions suivantes sont réunies :
(a) the pleadings disclose a reasonable cause of action;	a) les actes de procédure révèlent une cause d'action valable;
(b) there is an identifiable class of two or more persons;	b) il existe un groupe identifiable formé d'au moins deux personnes;
(c) the claims of the class members raise common questions of law or fact, whether or not those common questions predominate over questions affecting only individual members;	c) les réclamations des membres du groupe soulèvent des points de droit ou de fait communs, que ceux-ci prédominent ou non sur ceux qui ne concernent qu'un membre;
(d) a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact; and	d) le recours collectif est le meilleur moyen de régler, de façon juste et efficace, les points de droit ou de fait communs;
(e) there is a representative plaintiff or applicant who	e) il existe un représentant demandeur qui :
(i) would fairly and adequately represent the interests of the class,	(i) représenterait de façon équitable et adéquate les intérêts du groupe,

(ii) has prepared a plan for the proceeding that sets out a workable method of advancing the proceeding on behalf of the class and of notifying class members as to how the proceeding is progressing,	(ii) a élaboré un plan qui propose une méthode efficace pour poursuivre l'instance au nom du groupe et tenir les membres du groupe informés de son déroulement,
(iii) does not have, on the common questions of law or fact, an interest that is in conflict with the interests of other class members, and	(iii) n'a pas de conflit d'intérêts avec d'autres membres du groupe en ce qui concerne les points de droit ou de fait communs,
(iv) provides a summary of any agreements respecting fees and disbursements between the representative plaintiff or applicant and the solicitor of record.	(iv) communique un sommaire des conventions relatives aux honoraires et débours qui sont intervenues entre lui et l'avocat inscrit au dossier.

CONSIDERING that, pursuant to Rule 334.16(2), all relevant matters shall be considered in a determination of whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact, including whether: (a) the questions of law or fact common to the class members predominate over any questions affecting only individual members; (b) a significant number of the members of the class have a valid interest in individually controlling the prosecution of separate proceedings; (c) the class proceeding would involve claims that are or have been the subject of any other proceeding; (d) other means of resolving the claims are less practical or less efficient; and (e) the administration of the class proceeding would create greater difficulties than those likely to be experienced if relief were sought by other means;

CONSIDERING that:

(a) The conduct of the Crown at issue in this proposed class action proceeding, as set out in the Consolidated Statement of Claim, concerns two alleged forms of

discrimination against First Nations children: (i) the Crown's funding of child and family services for First Nations children and the incentive it has created to remove children from their homes; and (ii) the Crown's failure to comply with Jordan's Principles, a legal requirement that aims to prevent First Nations children from suffering gaps, delays, disruptions or denials in receiving necessary services and products contrary to their *Charter*-protected equality rights.

(b) As summarized by the Plaintiffs in their written representations, at its core, the Consolidated Statement of Claim alleges that:

(i) The Crown has knowingly underfunded child and family services for First Nations children living on Reserve and in the Yukon, and thereby prevented child welfare service agencies from providing adequate Prevention Services to First Nations children and families.

(ii) The Crown has underfunded Prevention Services to First Nations children and families living on Reserve and in the Yukon, while fully funding the costs of care for First Nations children who are removed from their homes and placed into out-of-home care, thereby creating a perverse incentive for First Nations child welfare service agencies to remove First Nations children living on Reserve and in the Yukon from their homes and place them in out-of-home care.

(iii) The removal of children from their homes caused severe and enduring trauma to those children and their families.

(iv) Not only does Jordan's Principle embody the Class Members' equality rights, the Crown has also admitted that Jordan's Principle is a "legal requirement" and thus an actionable wrong. However, the Crown has disregarded its obligations under Jordan's Principle and thereby denied crucial services and products to tens of thousands of First Nations children, causing compensable harm.

(v) The Crown's conduct is discriminatory, directed at Class Members because they were First Nations, and breached section 15(1) of the *Charter*, the Crown's fiduciary duties to First Nations and the standard of care at common and civil law.

(c) With respect to the first element of the certification analysis (namely, whether the pleading discloses a reasonable cause of action), the threshold is a low one. The question for the Court is whether it is plain and obvious that the causes of action are doomed to fail [see *Brake v Canada (Attorney General)*, 2019 FCA 274 at para 54]. Even without the Crown's consent, I am satisfied that the Plaintiffs have pleaded the necessary elements for each cause of action sufficient for purposes of this motion, such that the Consolidated Statement of Claim discloses a reasonable cause of action.

(d) With respect to the second element of the certification analysis (namely, whether there is an identifiable class of two or more persons), the test to be applied is whether the Plaintiffs have defined the class by reference to objective criteria such that a person can be identified to be a class member without reference to the merits

of the action [see *Hollick v Toronto (City of)*, 2001 SCC 68 at para 17]. I am satisfied that the proposed class definitions for the Removed Child Class, Jordan's Class and Family Class (as set out below) contain objective criteria and that inclusion in each class can be determined without reference to the merits of the action.

(e) With respect to the third element of the certification analysis (namely, whether the claims of the class members raise common questions of law or fact), as noted by the Federal Court of Appeal in *Wenham v Canada (Attorney General)*, 2018 FCA 199 at para 72, the task under this part of the certification determination is not to determine the common issues, but rather to assess whether the resolution of the issues is necessary to the resolution of each class member's claim. Specifically, the test is as follows:

> The commonality question should be approached purposively. The underlying question is whether allowing the suit to proceed as a representative one will avoid duplication of fact-finding or legal analysis. Thus an issue will be "common" only where its resolution is necessary to the resolution of each class member's claim. It is not essential that the class members be identically situated vis-à-vis the opposing party. Nor is it necessary that common issues predominate over non-common issues or that the resolution of the common issues would be determinative of each class member's claim. However, the class members' claims must share a substantial common ingredient to justify a class action. Determining whether the common issues justify a class action may require the court to examine the significant of the common issues in relation to individual issues. In doing so, the court should remember that it may not always be possible for a representative party to plead the claims of each class member with the same particularity as would be required in an individual suit. (*Western Canadian Shopping Centres*, above at para 39; see also *Vivendi Canada Inc. v. Dell'Aniello*, 2014 SCC 1, [2014] 1 S.C.R. 3 at paras 41 and 44-46.)

Having reviewed the common issues (as set out below), I am satisfied that the issues share a material and substantial common ingredient to the resolution of each class

member's claim. Moreover, I agree with the Plaintiff that the commonality of these issues is analogous to the commonality of similar issues in institutional abuse claims which have been certified as class actions (such as the Indian Residential Schools and the Sixties Scoop class action litigation). Accordingly, I find that the common issue element is satisfied.

(f) With respect to the fourth element of the certification analysis (namely, whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law), the preferability requirement has two concepts at its core: (i) whether the class proceeding would be a fair, efficient and manageable method of advancing the claim; and (ii) whether the class proceeding would be preferable to other reasonably available means of resolving the claims of class members. A determination of the preferability requirement requires an examination of the common issues in their context, taking into account the importance of the common issues in relation to the claim as a whole, and may be satisfied even where there are substantial individual issues [see *Brake*, *supra* at para 85; *Wenham*, *supra* at para 77 and *Hollick*, *supra* at paras 27-31]. The Court's consideration of this requirement must be conducted through the lens of the three principle goals of class actions, namely judicial economy, behaviour modification and access to justice [see *Brake*, *supra* at para 86, citing *AIC Limited v Fischer*, 2013 SCC 69 at para 22].

(g) Having considered the above-referenced principles and the factors set out in Rule 334.16(2), I am satisfied a class proceeding is the preferable procedure for the just

and efficient resolution of the common questions of fact and law. Given the systemic nature of the claims, the potential for significant barriers to access to justice for individual claimants and the Plaintiffs' stated concerns regarding the other means available for resolving the claims of class members, I am satisfied that the proposed class action would be a fair, efficient and manageable method of advancing the claims of the class members.

(h) With respect to the fifth element of the certification analysis (namely, whether there are appropriate proposed representatives), I am satisfied, having reviewed the affidavit evidence filed on the motion together with the detailed litigation plan, that the proposed representative plaintiffs (as set out below) meet the requirements of Rule 334.16(1)(e);

CONSIDERING that the Court is satisfied that all of the requirements for certification are met and that the requested relief should be granted;

THIS COURT ORDERS that:

1. The Plaintiffs are granted an extension of time, *nunc pro tunc*, to bring this certification motion past the deadline in Rule 334.15(2)(b) of the *Federal Courts Rules*.

2. For the purpose of this Order and in addition to definitions elsewhere in this Order, the following definitions apply and other terms in this Order have the same meaning as in the Consolidated Statement of Claim as filed on July 21, 2021:

(a) **"Class"** means the Removed Child Class, Jordan's Class and Family Class, collectively.

(b) **"Class Counsel"** means Fasken Martineau Dumoulin LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere and Sotos LLP.

(c) **"Class Members"** mean all persons who are members of the Class.

(d) **"Class Period"** means:

(i) For the Removed Child Class members and their corresponding Family Class members, the period of time beginning on April 1, 1991 and ending on the date of this Order; and

(ii) For the Jordan's Class members and their corresponding Family Class members, the period of time beginning on December 12, 2007 and ending on the date of this Order.

(e) **"Family Class"** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Removed Child Class and/or Jordan's Class.

(f) **"First Nation"** and **"First Nations"** means Indigenous peoples in Canada, including the Yukon and the Northwest Territories, who are neither Inuit nor Métis, and includes:

(i) Individuals who have Indian status pursuant to the *Indian Act*, R.S.C., 1985, c.I-5 [*Indian Act*];

(ii) Individuals who are entitled to be registered under section 6 of the *Indian Act* at the time of certification;

(iii) Individuals who met band membership requirements under sections 10-12 of the *Indian Act* and, in the case of the Removed Child Class members, have done so by the time of certification, such as where their respective First Nation community assumed control of its own membership by establishing membership rules and the individuals were found to meet the requirements under those membership rules and were included on the Band List; and

(iv) In the case of Jordan's Class members, individuals, other than those listed in sub-paragraphs (i)-(iii) above, recognized as citizens or members of their respective First Nations whether under agreement, treaties or First Nations' customs, traditions and laws.

(g) **"Jordan's Class"** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who during the Class Period were denied a service or product, or whose receipt of a service or product was delayed or disrupted, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a jurisdictional dispute with another government or governmental department.

(h) **"Removed Child Class"** means all First Nations individuals who:

(i) Were under the applicable provincial/territorial age of majority at any time during the Class Period; and

(ii) Were taken into out-of-home care during the Class Period while they, or at least one of their parents, were ordinarily resident on a Reserve.

(i) **"Reserve"** means a tract of land, as defined under the *Indian Act*, the legal title to which is vested in the Crown and has been set apart for the use and benefit of an Indian band.

3. This proceeding is hereby certified as a class proceeding against the Defendant pursuant to Rule 334.16(1) of the *Federal Courts Rules*.

4. The Class shall consist of the Removed Child Class, Jordan's Class and Family Class, all as defined herein.

5. The nature of the claims asserted on behalf of the Class against the Defendant is constitutional, negligence and breach of fiduciary duty owed by the Crown to the Class.

6. The relief claimed by the Class includes damages, *Charter* damages, disgorgement, punitive damages and exemplary damages.

7. The following persons are appointed as representative plaintiffs:

(a) For the Removed Child Class: Xavier Moushoom, Ashley Dawn Louise Bach and Karen Osachoff;

(b) For the Jordan's Class: Jeremy Meawasige (by his litigation guardian, Jonavon Joseph Measwasige) and Noah Buffalo-Jackson (by his litigation guardian, Carolyn Buffalo); and

(c) For the Family Class: Xavier Moushoom, Jonavon Joseph Meawasige, Melissa Walterson, Carolyn Buffalo and Dick Eugene Jackson (also known as Richard Jackson),

all of whom are deemed to constitute adequate representative plaintiffs of the Class.

8. Class Counsel are hereby appointed as counsel for the Class.

9. The proceeding is certified on the basis of the following common issues:

(a) Did the Crown's conduct as alleged in the Consolidated Statement of Claim [Impugned Conduct] infringe the equality right of the Plaintiffs and Class Members under section 15(1) of the *Canadian Charter of Rights and Freedoms*? More specifically:

(i) Did the Impugned Conduct create a distinction based on the Class Members' race, or national or ethnic origin?

(ii) Was the distinction discriminatory?

(iii) Did the Impugned Conduct reinforce and exacerbate the Class Members' historical disadvantages?

(iv) If so, was the violation of section 15(1) of the *Charter* justified under section 1 of the *Charter*?

(v) Are *Charter* damages an appropriate remedy?

(b) Did the Crown owe the Plaintiffs and Class Members a common law duty of care?

(i) If so, did the Crown breach that duty of care?

(c) Did the Crown breach its obligations under the *Civil Code of Québec*? More specifically:

(i) Did the Crown commit fault or engage its civil liability?

(ii) Did the Impugned Conduct result in losses to the Plaintiffs and Class Members and if so, do such losses constitute injury to each of the Class Members?

(iii) Are Class Members entitled to claim damages for the moral and material damages arising from the foregoing?

(d) Did the Crown owe the Plaintiffs and Class Members a fiduciary duty?

(i) If so, did the Crown breach that duty?

(e) Can the amount of damages payable by the Crown be determined partially under Rule 334.28(1) of the *Federal Courts Rules* on an aggregate basis?

(i) If so, in what amount?

(f) Did the Crown obtain quantifiable monetary benefits from the Impugned Conduct during the Class Period?

(i) If so, should the Crown be required to disgorge those benefits?

(ii) If so, in what amount?

(g) Should punitive and/or aggravated damages be awarded against the Crown?

(i) If so, in what amount?

10. The Plaintiffs' Fresh as Amended Litigation Plan, as filed November 2, 2021 and attached hereto as Schedule "A", is hereby approved, subject to any modifications necessary as a result of this Order and subject to any further orders of this Court.

11. The form of notice of certification, the manner of giving notice and all other related matters shall be determined by separate order(s) of the Court.

12. The opt-out period shall be six months from the date on which notice of certification is published in the manner to be specified by further order of this Court.

13. The timetable for this proceeding through to trial shall also be determined by separate order(s) of the Court.

14. Pursuant to Rule 334.39(1) of the *Federal Courts Rules*, there shall be no costs payable by any party for this motion.

AFFIDAVIT OF ZACHEUS JOSEPH TROUT

(Sworn September 2, 2022)

I, Zacheus Joseph Trout, of the Cross Lake First Nation in Manitoba, SWEAR THAT:

1. I am a representative plaintiff in this action (Court File No. T-1120-21). As such, I have personal knowledge of the matters that I depose to in this affidavit. Where the source of information is other than my personal knowledge, I say so and I believe that information to be true.

2. In this affidavit, I explain why I support the proposed settlement reached with Canada.

Background

3. My wife, Veronica Trout, and I have had six children. Two of our children were Sanaye Mary Frances Trout who was born on July 20, 1998, and Jacob Zacheus Trout, who was born on June 28, 2002.

4. Both Sanaye and Jacob suffered from Batten Disease. Batten Disease is a neurological disorder that normally begins at an early age in childhood and, if left untreated, is fatal. Batten Disease causes seizures, vision loss, and the loss of cognitive functions. Sanaye and Jacob suffered extreme sickness all their lives because of Batten Disease.

5. When we found out that Sanaye and Jacob had Batten Disease, we tried to get them treatment. But we could not get them support and adequate treatment.

6. Sanaye and Jacob did not receive proper treatment and support because none was available on our reserve. When we tried to get care and support for them from the government, every person we turned to pointed to the other and said we should go elsewhere for help. Manitoba would say it is Canada's responsibility because we are registered Indians. We did not even know who to turn to from Canada to get help. No help existed. There was no way to apply for help.

7. My wife and I had to quit our jobs to be able to provide 24-hour care to Sanaye and Jacob, taking turns to sleep. Before quitting our jobs to care for our kids, Veronica was a cook at the school and I worked as a qualified surveyor and on shoreline restoration for my community.

8. We fought for 13 years for basic services and products that Sanaye and Jacob desperately needed and could not receive. Sometimes we would receive limited help after a lot of delay.

9. For example, Sanaye and Jacob needed feeding tubes, diapers, and formula. Health officials gave us only six syringes per month for Sanaye, even though she needed to receive six injections a day. We had to reuse these syringes, causing my child infections and more seizures.

10. We received two feeding bags per month to feed Sanaye and Jacob four times a day. We had to boil and reuse these bags even though they get covered in bacteria and caused more infections.

11. The children had to be inclined to be fed. That required a bed that inclined over 30 degrees. We asked medical services, the hospitals, the program director at our community who would receive funding from Canada for a bed. They all answered they did not provide beds and did not have funding to provide us a bed.

12. It was about two years before my daughter passed away when we eventually were able to obtain a used run-down inclined bed from a seniors' home. We could also not find Jacob a bed until shortly before he passed away.

13. The years when Sanaye and Jacob did not have inclined beds they suffered sleep problems, more seizures, pneumonias and, respiratory problems caused by acid reflex from the medication they had to take. We had to manually incline them to help them feed and they would sometimes fall from their regular beds at night when we fell asleep.

14. Jacob and Sanaye both passed away before they reached the age of 10. Sanaye passed away on December 27, 2007. Jacob passed away on June 13, 2012.

15. The many years that this situation lasted, it took an unspeakable mental and emotional toll on us and our children.

My Role in the Class Action

16. I became involved in this class action after Canada refused to negotiate about the First Nations children, like Jacob and Sanaye, who had faced delays, denials or gaps in essential services that they needed between 1991 and 2007. Canada intended to fight this case. So the parties agreed to separate it from the rest of the class action so that it could be litigated, while the other parts of the case moved to settlement discussions.

17. On July 7, 2021, Justice St-Louis ordered that the cases be separated. Attached as **Exhibit "A"** is a copy of that order without schedules. Shortly after that, we started this action, which is now known as the "Trout Action".

18. I have stayed closely involved in this litigation. I have met with David Sterns and Mohsen Seddigh at Sotos LLP in person twice to advance the case. I have spoken and communicated by text messaging with Mr. Seddigh countless times as the lawsuit progressed.

19. Because Canada at first refused to negotiate the Trout Action during the mediation with the Honourable Mr. Mandamin, I never had the chance to attend those meetings and speak about my children and what they endured. I felt dismayed and left out of that process. But I was happy that other representative plaintiffs had the opportunity to speak their truth and guide the negotiations.

20. We prepared for a fight for certification. I worked with class counsel to make an affidavit in support of the motion for certification. I reviewed the documents that Mr. Seddigh sent me and provided feedback. These included documents such as the Statement of Claim, my draft affidavits, the Court's orders, and settlement materials. I understood and explained my responsibilities as a representative plaintiff when I asked to be appointed as such. I have taken these responsibilities seriously and tried to the best of my ability to fairly and adequately represent the class.

21. Canada finally changed its mind after the mediation with the Honourable Mr. Mandamin and was willing negotiate the Trout Action.

22. Madam Justice Aylen certified the claim on February 11, 2022 and appointed me as the representative plaintiff. Attached as **Exhibit "B"** is a copy of that order without schedules.

23. During this litigation, I spoke to Indigenous media to tell our story and advocate for change for First Nations children:

- *'It's a nightmare': Zach Trout watched two of his children die, now he's fighting Canada for justice* - https://www.aptnnews.ca/national-news/zach-trout-watched-two-of-his-children-die-now-hes-fighting-canada-for-justice/
- *Plaintiffs skeptical but hopeful proposed First Nations child welfare settlement will lead to change* - https://www.aptnnews.ca/featured/plaintiffs-skeptical-but-hopeful-about-proposed-child-welfare-settlement/

24. Speaking about what happened to us and our children brings back a lot of trauma. But I have never shied away from doing that if it helps other kids and families. I hope that our story can inspire change and bring meaningful compensation to First Nations people who suffered like we did.

25. Last month, my wife and I travelled to Toronto to meet with class counsel, the other representative plaintiff, Jonavon Meawasige, and with our team's expert working on a Jordan's Principle and Trout method, Dr. Lucyna Lach, who joined us by video conference.

26. In our discussions, I emphasized a principle that has always been important to me: that is proportionality in compensation. I firmly believe that discrimination in all its forms is harmful. But I also know what my children and family suffered, and believe people in such extreme situations should not receive the same compensation as everyone else who did not go through

something similar. I think it would be a failure and unfair to treat everyone in the class the same way. From the beginning, I have asked class counsel to keep this principle in mind. I am pleased that they listened, that the settlement agreement takes that principle into account, and that the method being developed is also built on that basis.

27. The settlement agreement divides the Trout Child Class claimants into two groups: those who suffered more and those who suffered less than the first group. This way the settlement agreement can ensure that those who suffered more will receive at least $20,000 (or more) in compensation. Everyone else receives compensation of up to $20,000 but not more than that. I agree with this division because it helps bring proportionality into the claims process, it protects those who suffered more, and responsibly divides the $2 billion budget for the Trout Child Class.

28. Despite my unwavering faith in our case, I understand the legal challenges that the case could face. I think the results achieved by the settlement agreement are outstanding and they will make a positive impact on the lives of many who suffered discrimination.

29. I remember that when we filed the Statement of Claim we asked for one billion dollars in compensation. I am thrilled that the settlement agreement now includes a budget twice that amount for the children, and also includes a part of another $2 billion budget for the caregiving parents and grandparents of those children. We have achieved far more than we hoped to achieve, and I feel proud and honoured to have played a role in that achievement for our kids.

30. I am pleased that the settlement agreement takes a trauma-informed and culturally sensitive approach to claimants. I am a very traditional and spiritual First Nations person and I care deeply about these principles that the settlement agreement embodies.

Honorarium

31. I wish to ask the Court for an honorarium given the circumstances of this case and the toll it has taken on me and my family to advance it and re-live our trauma.

Class Counsel

32. I have been continuously engaged with class counsel during this litigation and guided their approach. As I said earlier, I am very happy with the result they achieved and satisfied with their work on this class action.

33. Instead of pursuing the arrangement in the retainer agreement, class counsel have agreed to separately negotiate their fees directly with Canada and be paid over and above the settlement amount. This means that class counsel's fees will not be deducted from the $20 billion settlement amount. I fully support this plan because it does not decrease the money that is available to pay compensation to class members.

34. Mr. Seddigh advises me and I believe that class counsel have not yet negotiated their fees with Canada.

ORDER
(Consolidated, Leave to Commence Actions, and other Relief)

UPON MOTION, by the plaintiffs for an Order:

(a) granting leave *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 under this Court's Order dated May 28, 2019 in Court File No. T-402-19 ("**Preclusion Order**") to commence the proposed class proceeding in Court File No. T-141-20;

(b) consolidating the actions in Court File No. T-402-19 and Court File No. T-141-20 ("**Consolidated Proceeding**");

(c) adding Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson as plaintiffs to the Consolidated Proceeding;

(d) appointing Jonavon Joseph Meawasige as representative and litigation guardian for the plaintiff Jeremy Meawasige;

(e) appointing Carolyn Buffalo as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson;

(f) granting leave to serve and file the Consolidated Statement of Claim in the Consolidated Proceeding substantially in the form enclosed as **Schedule "A"** hereto;

(g) amending the style of cause in the Consolidated Proceeding accordingly, as drafted in Schedule "A" hereto;

(h) stating that the removal of the Jordan's Class members and corresponding Family Class members with claims dated between April 1, 1991 and December 11, 2007 in Court File No. T-402-19 and/or Court File No. T-141-20 from the Consolidated Proceeding is without prejudice to those class members' rights to commence a new action and to advance any arguments available to them notwithstanding this Order and notwithstanding the Consolidated Proceeding;

(i) granting the Assembly of First Nations ("**AFN**") and Zacheus Joseph Trout leave under the Preclusion Order to commence a proposed class action on behalf of the class members whose claims are separated from the Consolidated Proceedings as particularized in the draft claim substantially in the form enclosed as **Schedule "B"** hereto ("**Separated Proceeding**");

(j) stating that this Order is without prejudice to the defendant's right to contest certification and/or defend against the claims in the Separated Proceeding as it would have been immediately prior to the issuance of this Order, subject to paragraph (h), above;

(k) extending the Preclusion Order to:

i. the Consolidated Proceeding in Schedule "A" from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

ii. the Separated Proceeding from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel;

(l) and other relief;

AND UPON being advised that the defendant consents in whole to the motion as filed;

AND UPON hearing amicus curiae and counsel's submissions;

AND UPON being satisfied of the appropriateness of the relief sought:

1. **THIS COURT ORDERS** that leave is granted *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 to commence the proposed class proceeding in Court File No. T-141-20.

2. **THIS COURT ORDERS** that the actions in Court File No. T-402-19 and Court File No. T-141-20 are consolidated.

3. **THIS COURT ORDERS** that Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson are added as plaintiffs to the Consolidated Proceeding.

4. **THIS COURT ORDERS** that Jonavon Joseph Meawasige is appointed as representative and litigation guardian for the plaintiff Jeremy Meawasige.

5. **THIS COURT ORDERS** that Carolyn Buffalo is appointed as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson.

6. **THIS COURT ORDERS** that leave is granted to serve and file the Consolidated Statement of Claim substantially in the form enclosed as Schedule "A" hereto.

7. **THIS COURT ORDERS** that the style of cause of the Consolidated Proceeding is amended accordingly, as drafted in Schedule "A".

8. **THIS COURT ORDERS** that the separation of the claims in the Separated Proceeding from the Consolidated Proceeding is without prejudice to the rights of the class members in the Separated Proceeding to commence a new action and to advance any arguments available to them immediately prior to the issuance of this Order, notwithstanding this Order and notwithstanding the Consolidated Proceeding.

9. **THIS COURT ORDERS** that leave is granted to the plaintiffs AFN and Zacheus Joseph Trout to commence a proposed class action on behalf of the Separated Classes substantially in the form enclosed as Schedule "B" hereto.

10. **THIS COURT ORDERS** that this Order is without prejudice to the defendant's rights to contest certification and defend against the Separated Proceeding, subject to paragraph 8 of this Order.

11. **THIS COURT ORDERS** that this Court's Order dated May 28, 2019 in Court File No. T-402-19, which precludes the commencement of another proposed class proceeding in this Court in respect of the allegations in this proceeding without leave of the Court, be and is extended and shall apply to:

(a) the Consolidated Proceeding in Schedule “A” as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

(b) the Separated Proceeding as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel.

"Martine St-Louis"
Judge

This is Exhibit “B” referred to in the Affidavit of Zacheus Joseph Trout of the Cross Lake First Nation in Manitoba, sworn before me at the City of Toronto, in the Province of Ontario on September 2, 2022, in accordance with O. Reg. 431/20, Administering Oath or Declaration Remotely.

Commissioner for Taking Affidavits (or as may be)

Federal Court Cour fédérale

Date: 20220211

Docket: T-1120-21

Citation: 2022 FC 149

Ottawa, Ontario, February 11, 2022

PRESENT: The Honourable Madam Justice Aylen

CLASS PROCEEDING

BETWEEN:

ASSEMBLY OF FIRST NATIONS and ZACHEUS JOSEPH TROUT

Plaintiffs

and

THE ATTORNEY GENERAL OF CANADA

Defendant

ORDER AND REASONS

UPON MOTION by the Plaintiffs, on consent and determined in writing pursuant to Rule 369 of the *Federal Courts Rules*, for an order:

(a) Granting the Plaintiffs an extension of time to make this certification motion past the deadline in Rule 334.15(2)(b);

(b) Certifying this proceeding as a class proceeding and defining the class;

(c) Stating the nature of the claims made on behalf of the class and the relief sought by the class;

(d) Stipulating the common issues for trial;

(e) Appointing the Plaintiff, Zacheus Joseph Trout, as representative plaintiff;

(f) Approving the litigation plan; and

(g) Other relief;

CONSIDERING the motion materials filed by the Plaintiffs;

CONSIDERING that the Defendant has advised that the Defendant consents in whole to the motion as filed;

CONSIDERING that the Court is satisfied, in the circumstances of this proceeding, that an extension of time should be granted to bring this certification motion past the deadline prescribed in Rule 334.15(2)(b);

CONSIDERING that while the Defendant's consent reduces the necessity for a rigorous approach to the issue of whether this proceeding should be certified as a class action, it does not relieve the Court of the duty to ensure that the requirements of Rule 334.16 for certification are met [see *Varley v Canada (Attorney General)*, 2021 FC 589];

CONSIDERING that Rule 334.16(1) of the *Federal Courts Rules* provides:

Subject to subsection (3), a judge shall, by order, certify a proceeding as a class proceeding if

(a) the pleadings disclose a reasonable cause of action;

(b) there is an identifiable class of two or more persons;

(c) the claims of the class members raise common questions of law or fact, whether or not those common questions predominate over questions affecting only individual members;

(d) a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact; and

(e) there is a representative plaintiff or applicant who

(i) would fairly and adequately represent the interests of the class,

(ii) has prepared a plan for the proceeding that sets out a workable method of advancing the proceeding on behalf of the class and of notifying class members as to how the proceeding is progressing,

(iii) does not have, on the common questions of law or fact, an interest that is in conflict with the interests of other class members, and

(iv) provides a summary of any agreements respecting fees and disbursements between the representative plaintiff or applicant and the solicitor of record.

Sous réserve du paragraphe (3), le juge autorise une instance comme recours collectif si les conditions suivantes sont réunies :

a) les actes de procédure révèlent une cause d'action valable;

b) il existe un groupe identifiable formé d'au moins deux personnes;

c) les réclamations des membres du groupe soulèvent des points de droit ou de fait communs, que ceux-ci prédominent ou non sur ceux qui ne concernent qu'un membre;

d) le recours collectif est le meilleur moyen de régler, de façon juste et efficace, les points de droit ou de fait communs;

e) il existe un représentant demandeur qui :

(i) représenterait de façon équitable et adéquate les intérêts du groupe,

(ii) a élaboré un plan qui propose une méthode efficace pour poursuivre l'instance au nom du groupe et tenir les membres du groupe informés de son déroulement,

(iii) n'a pas de conflit d'intérêts avec d'autres membres du groupe en ce qui concerne les points de droit ou de fait communs,

(iv) communique un sommaire des conventions relatives aux honoraires et débours qui sont intervenues entre lui et l'avocat inscrit au dossier.

CONSIDERING that, pursuant to Rule 334.16(2), all relevant matters shall be considered in a determination of whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact, including whether: (a) the questions of law or fact common to the class members predominate over any questions affecting only individual members; (b) a significant number of the members of the class have a valid interest in individually controlling the prosecution of separate proceedings; (c) the class proceeding would involve claims that are or have been the subject of any other proceeding; (d) other means of resolving the claims are less practical or less efficient; and (e) the administration of the class proceeding would create greater difficulties than those likely to be experienced if relief were sought by other means;

CONSIDERING that:

(a) The conduct of the Crown at issue in this proposed class action proceeding, as set out in the Statement of Claim, concerns discrimination against First Nations children in the provision of essential services and the Crown's failure to prevent First Nations children from suffering gaps, delays, disruptions or denials in receiving services and products contrary to their *Charter*-protected equality rights. The Plaintiffs allege that the Crown's conduct was discriminatory, directed at Class Members because they were First Nations, and breached section 15(1) of the *Charter*, the Crown's fiduciary duties to First Nations and the standard of care at common and civil law.

(b) With respect to the first element of the certification analysis (namely, whether the pleading discloses a reasonable cause of action), the threshold is a low one. The question for the Court is whether it is plain and obvious that the causes of action are doomed to fail [see

Brake v Canada (Attorney General), 2019 FCA 274 at para 54]. Even without the Crown's consent, I am satisfied that the Plaintiffs have pleaded the necessary elements for each cause of action sufficient for purposes of this motion, such that the Statement of Claim discloses a reasonable cause of action.

(c) With respect to the second element of the certification analysis (namely, whether there is an identifiable class of two or more persons), the test to be applied is whether the Plaintiffs have defined the class by reference to objective criteria such that a person can be identified to be a class member without reference to the merits of the action [see *Hollick v Toronto (City of)*, 2001 SCC 68 at para 17]. I am satisfied that the proposed class definitions for the Child Class and Family Class (as set out below) contain objective criteria and that inclusion in each class can be determined without reference to the merits of the action.

(d) With respect to the third element of the certification analysis (namely, whether the claims of the class members raise common questions of law or fact), as noted by the Federal Court of Appeal in *Wenham v Canada (Attorney General)*, 2018 FCA 199 at para 72, the task under this part of the certification determination is not to determine the common issues, but rather to assess whether the resolution of the issues is necessary to the resolution of each class member's claim. Specifically, the test is as follows:

> The commonality question should be approached purposively. The underlying question is whether allowing the suit to proceed as a representative one will avoid duplication of fact-finding or legal analysis. Thus an issue will be "common" only where its resolution is necessary to the resolution of each class member's claim. It is not essential that the class members be identically situated vis-à-vis the opposing party. Nor is it necessary that common issues predominate over non-common issues or that the resolution of the common issues would be determinative of each class member's claim. However, the class members' claims must

> share a substantial common ingredient to justify a class action. Determining whether the common issues justify a class action may require the court to examine the significant of the common issues in relation to individual issues. In doing so, the court should remember that it may not always be possible for a representative party to plead the claims of each class member with the same particularity as would be required in an individual suit. (Western Canadian Shopping Centres, above at para 39; see also Vivendi Canada Inc. v. Dell'Aniello, 2014 SCC 1, [2014] 1 S.C.R. 3 at paras 41 and 44-46.)

Having reviewed the common issues (as set out below), I am satisfied that the issues share a material and substantial common ingredient to the resolution of each class member's claim. Moreover, I agree with the Plaintiffs that the commonality of these issues is analogous to the commonality of similar issues in institutional abuse claims which have been certified as class actions (such as the Indian Residential Schools and the Sixties Scoop class action litigation), as well as those certified in the Moushoom class action (T-402-19/T-141-20). Accordingly, I find that the common issue element is satisfied.

(e) With respect to the fourth element of the certification analysis (namely, whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law), the preferability requirement has two concepts at its core: (i) whether the class proceeding would be a fair, efficient and manageable method of advancing the claim; and (ii) whether the class proceeding would be preferable to other reasonably available means of resolving the claims of class members. A determination of the preferability requirement requires an examination of the common issues in their context, taking into account the importance of the common issues in relation to the claim as a whole, and may be satisfied even where there are substantial individual issues [see *Brake*, *supra* at para 85; *Wenham*, *supra* at para 77 and *Hollick*, *supra* at paras 27-31]. The

Court's consideration of this requirement must be conducted through the lens of the three principle goals of class actions, namely judicial economy, behaviour modification and access to justice [see *Brake*, *supra* at para 86, citing *AIC Limited v Fischer*, 2013 SCC 69 at para 22].

(f) Having considered the above-referenced principles and the factors set out in Rule 334.16(2), I am satisfied a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law. Given the systemic nature of the claims, the potential for significant barriers to access to justice for individual claimants and the concerns regarding the other means available for resolving the claims of class members, I am satisfied that the proposed class action would be a fair, efficient and manageable method of advancing the claims of the class members.

(g) With respect to the fifth element of the certification analysis (namely, whether there are appropriate proposed representatives), I am satisfied, having reviewed the affidavit evidence filed on the motion together with the detailed litigation plan, that the proposed representative plaintiff meets the requirements of Rule 334.16(1)(e);

CONSIDERING that the Court is satisfied that all of the requirements for certification are met and that the requested relief should be granted;

THIS COURT ORDERS that:

1. The Plaintiffs are granted an extension of time, *nunc pro tunc*, to bring this certification motion past the deadline in Rule 334.15(2)(b) of the *Federal Courts Rules*.

2. For the purpose of this Order and in addition to definitions elsewhere in this Order, the following definitions apply and other terms in this Order have the same meaning as in the Statement of Claim:

(a) **"Child Class"** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who, during the Class Period, did not receive (whether by reason of a denial or a gap) an essential public service or product relating to a confirmed need, or whose receipt of said service or product was delayed, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a service gap or jurisdictional dispute with another government or governmental department.

(b) **"Class" means** the Child Class and Family Class, collectively.

(c) **"Class Counsel"** means Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere and Fasken Martineau Dumoulin LLP.

(d) **"Class Members"** mean all persons who are members of the Class.

(e) **"Class Period"** means the period of time beginning on April 1, 1991 and ending on December 11, 2007.

(f) **"Family Class"** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Child Class.

(g) **"First Nation"** and **"First Nations"** means Indigenous peoples in Canada, including the Yukon and the Northwest Territories, who are neither Inuit nor Métis, and includes:

i. Individuals who have Indian status pursuant to the *Indian Act*, R.S.C., 1985, c.I-5 [*Indian Act*];

ii. Individuals who are entitled to be registered under section 6 of the *Indian Act* at the time of certification;

iii. Individuals who met band membership requirements under sections 10-12 of the *Indian Act*, such as where their respective First Nation community assumed control of its own membership by establishing membership rules and the individuals were found to meet the requirements under those membership rules and were included on the Band List; and

iv. Individuals, other than those listed in sub-paragraphs (i)-(iii) above, recognized as citizens or members of their respective First Nations whether under agreement, treaties or First Nations' customs, traditions and laws by the date of trial or resolution otherwise of this action.

3. This proceeding is hereby certified as a class proceeding against the Defendant pursuant to Rule 334.16(1) of the *Federal Courts Rules*.

4. The Class shall consist of the Child Class and Family Class, all as defined herein.

5. The nature of the claims asserted on behalf of the Class against the Defendant is constitutional, negligence and breach of fiduciary duty owed by the Crown to the Class.

6. The relief claimed by the Class includes damages, *Charter* damages, disgorgement, punitive damages and exemplary damages.

7. Zacheus Joseph Trout is appointed as representative plaintiff and is deemed to constitute an adequate representative of the Class, complying with the requirements of Rule 334.16(1)(e).

8. Class Counsel are hereby appointed as counsel for the Class.

9. The proceeding is certified on the basis of the following common issues:

   (a) Did the Crown's conduct as alleged in the Statement of Claim [Impugned Conduct] infringe the equality right of the Class under section 15(1) of the *Canadian Charter of Rights and Freedoms*? More specifically:

      i. Did the Impugned Conduct create a distinction based on the Class' race, or national or ethnic origin?

      ii. Was the distinction discriminatory?

      iii. Did the Impugned Conduct reinforce and exacerbate the Class' historical disadvantages?

iv. If so, was the violation of section 15(1) of the *Charter* justified under section 1 of the *Charter*?

v. Are *Charter* damages an appropriate remedy?

(b) Was the Crown negligent towards the Class? More specifically:

i. Did the Crown owe the Class a duty of care?

ii. If so, did the Crown breach that duty of care?

(c) Did the Crown breach its obligations under the *Civil Code of Québec*? More specifically:

i. Did the Crown commit fault or engage its civil liability?

ii. Did the Impugned Conduct result in losses to the Class and if so, do such losses constitute injury to each of the members of the Class?

iii. Are members of the Class entitled to claim damages for the moral and material damages arising from the foregoing?

(d) Did the Crown owe the Class a fiduciary duty? If so, did the Crown breach that duty?

(e) Can the amount of damages payable by the Crown be determined partially under Rule 334.28(1) of the *Federal Courts Rules* on an aggregate basis? If so, in what amount?

(f) Did the Crown obtain quantifiable monetary benefits from the Impugned Conduct during the Class Period? If so, should the Crown be required to disgorge those benefits and if so, in what amount?

(g) Should punitive and/or aggravated damages be awarded against the Crown? If so, in what amount?

10. The Litigation Plan attached hereto as Schedule "A" is hereby approved, subject to any modifications necessary as a result of this Order and subject to any further orders of this Court.

11. The form of notice of certification, the manner of giving notice and all other related matters shall be determined by separate order(s) of the Court.

12. Notice of certification shall be given at the same time as the notice of certification of the companion Moushoom class action (Court File Nos. T-402-19/T-141-20), which shall be determined by separate order of this Court.

13. The opt-out period shall be six months from the date on which notice of certification is published in the manner to be specified by further order of this Court.

14. Pursuant to Rule 334.39(1) of the *Federal Courts Rules*, there shall be no costs payable by any party for this motion.

"Mandy Aylen"

Plaintiffs

and

THE ATTORNEY GENERAL OF CANADA

Defendant

AFFIDAVIT OF MELISSA WALTERSON
(affirmed August [●], 2022)

I, Melissa Walterson, of the City of Winnipeg, in the Province of Manitoba, AFFIRM:

1. I make this affidavit in support of an application to obtain approval of the settlement agreement. I am one of the Representative Plaintiffs in the within action and as such have knowledge of the matters hereinafter deposed to. Where I make statements in this affidavit which are not within my personal knowledge, I have identified the source of that information and belief. All of the information I have deposed to I verily believe to be true.

2. In preparing to affirm this affidavit, I have reviewed, among other things, the Fresh as Amended Statement of Claim, the Consolidated Statement of Claim, the list of proposed common issues, and the proposed litigation plan. I have also reviewed the proposed Final Settlement Agreement as well as motion material for the Canadian Human Rights Tribunal and this Court.

BACKGROUND

3. I am a sister of representative plaintiff Karen Osachoff. She is a representative plaintiff for the Removed Child Class and I am a representative plaintiff for the Removed Child Family Class.

4. I was born in Winnipeg, Manitoba. I have Indian Status and I am registered on Nisichawayasihk Cree Nation in Manitoba. I currently reside in Manitoba. I reconnected with Ms. Osachoff in December 2019. Before this time, I did not know about any sisters that I may have been related to.

5. Although I am a representative plaintiff of the Removed Child Family Class, I was also removed from my Indigenous family. Thus, my role in this class action is really about my relationship with my newly found sister Karen Osachoff, a representative plaintiff of the Removed Child Class but since I am being given the opportunity, I will also share a bit of my story with the court.

6. Before I begin, I need to say that I have agreed to be a representative plaintiff in this lawsuit not because I have a personal agenda. I am doing this, so my story is heard and my hope is that the racial discrimination towards my people ends.

7. I will refer to the parents that adopted me as "mom" and "dad" and to their children as "brothers".

8. I was adopted at birth. My mom took me home right from the hospital. Mom and dad wanted a girl after trying five times and getting five boys. Mom and dad were older (in their early 50's) when they brought me home, so my brothers were already grown up with children of their own.

9. My brothers Glen and Gary supported me throughout my entire life. Glen bought me cars and horses, coached me in baseball, which made me the best hitter on my team. Gary and his wife supported me in all my athletic dreams, making sure I had a ride to my countless baseball games and Manitoba Marathons. My mom spoiled me and did everything she possible could to make sure I turned out to be a decent adult. In many ways, I was fortunate for the support of my adoptive family. However, this is not to say that it was all an idyllic situation, as I have faced racial

discrimination throughout my life. My mom was the peacekeeper who never wanted conflict between me and the family. She raised me to just leave it be if anyone treated me poorly, so that is what I did. I kept my mouth shut.

10. I grew up in Lake Francis, Manitoba. I went to a school where I was the minority. I was the tallest student in my class until grade seven, I had long skinny legs, no bum, and dark skin while everyone else was the complete opposite. I always felt I could never fit in and I never felt like I was pretty.

11. By the time I was a young adult, I made a conscious decision to change my ethnicity to Spanish when asked, to sidestep racism and judgment. I have been called a "squaw", "half-breed", "wagon-burner" and, one of my personal favorites, my brother calling me "Princess Hiawatha". There was a point in my life that I even joined in the racism against my people so I wouldn't have to experience it on a personal level. I severed communication with any slight relationship I did have with my biological family because I just wanted to fit in and be "white".

12. One of my brothers has made my life very difficult in recent years and drove a wedge between my mom and me. I have begun to realize that I will never have a feeling of true belonging with this family, despite my strong connection with my mom, Gary and Glen. I continue to have very limited communication with my family because the fear is very much alive within me.

13. I first found out that I had two sisters, Karen and Kendra, when I attended the Assembly of First Nations' Special Assembly in Ottawa in December 2019. I

was given Karen's telephone number and I called her right away. We have kept in close communication since then.

14. In speaking with my sister, I found out that I have siblings, but also learned that I will never have the pleasure of meeting many of them because they have passed away. Karen has turned out to be the bond I missed out on my whole life. There is a certain feeling I get from being with my sister Karen, which is a feeling that I belong. It's the same feeling I get with my biological brothers with whom I have since connected, Corey and Ovide.

My efforts in this class action

15. In early January 2020, my sister Karen Osachoff phoned me to ask if I would consider being a representative plaintiff for a class action on discriminatory underfunding of First Nations Child and Family Services. I agreed to be a representative plaintiff for the Removed Child Family Class.

16. On or about January 24, 2020, I retained Nahwegahbow Corbiere ("NC") to represent me in this class action.

17. On January 28, 2020, this action was commenced by way of Statement of Claim. A Fresh as Amended Statement of Claim was filed with proof of service on March 6, 2020.

18. In July 2020, NC in collaboration with Fasken LLP agreed with counsel prosecuting the proposed class action in Moushoom et al v Canada, Court File No. T-402-19, namely Sotos LLP, Kugler Kandestin LLP, and Miller Titerle +

Company, to join forces and advance the action as one proceeding (collectively, "Class Counsel").

19. I have received regular reports from NC and Fasken LLP since the commencement of this action. During the negotiations that took place from November 2020 to December, 2021, I was updated on a regular basis via videoconference with the other representative plaintiffs and by telephone from Dianne Corbiere and Ms. Osachoff. I was able to provide input on the various aspects of the negotiation that I thought were important. I have always felt I had current and relevant information from both law firms.

20. From the commencement of this class action, I knew that the claim was going to be difficult and challenging and that NC and Fasken LLP were working diligently on my behalf. I am pleased with the representation that I received from both law firms.

21. Throughout this case I have:

a) Signed on with NC and signed a retainer agreement with them;

b) Agreed to be a representative plaintiff on behalf of the other class members;

c) Spoken with and attended many meetings with NC and Fasken LLP to discuss this case and my experience with being removed from my family permanently and losing out on a relationship with my sister Karen and our other siblings;

d) Provided instructions to NC and Fasken LLP; and

e) Reviewed and approved the settlement terms in this case.

22. I have been kept informed and provided input on various aspects of the lawsuit including settlement discussions that took place over the course of the lawsuit including at some of the mediation sessions with Justice Mandamin and a meeting with Justice Murray Sinclair which I understand helped us reach settlement with the Government of Canada. My lawyers have regularly discussed the negotiations and strategy by phone, text messages, videoconference meetings and by email.

23. I have also attended more than 30 meetings over the past two and half years with NC, Fasken LLP and the AFN to discuss the case. I have read all documents they have provided to me and gave input when I thought I had something to add to the negotiations.

24. In the future, I will continue to be involved in the case as necessary and will continue to speak to other class members.

Direct Impacts on me as a Representative Plaintiff

25. My participation as a representative plaintiff in the class action has negatively impacted upon my relationships and my life overall. Immediately after the class action was filed, my relationships with my adoptive family members, including my siblings, aunts, uncles, were negatively impacted. Some of them were hurt and upset that the class action was filed. They are ashamed of me and believe I am putting our family name into disrepute by representing the removed child

family class. My siblings and I do not speak anymore, and I don't believe our relationship will ever recover. I have been essentially disowned by my adoptive family.

26. My mental health has been negatively impacted because of being in child welfare and intergenerational trauma from residential schools and colonization. This was exacerbated by being disowned by my adoptive family.

27. While I do not regret becoming a representative plaintiff for the Removed Child Family Class, I do wish I could have known about and prepared for the extensive impacts on my life. I know these impacts will continue into the foreseeable future and while I am taking steps to deal with them, they are still challenging to deal with every day.

The Settlement Agreement is Fair and Reasonable

28. I am happy that the parties have reached an agreement for what I view as a great outcome for First Nations children and their families. I knew that it was important to resolve this matter so that the class members could begin their process of healing.

29. During November 2020-January 2021, I attended court ordered mediation sessions before Honourable Tony Mandamin to introduce myself and tell a bit of my personal history to the parties. This participation was at the request of Justice Mandamin.

30. When this mediation stalled, I was informed by Ms. Osachoff that my lawyers then agreed to attend negotiations to be chaired by the Honourable Murray Sinclair.

31. On November 9 and 10, 2021, I attended these negotiations session before the Honourable Murray Sinclair.

32. Later in November 2021, I was informed by Ms. Osachoff that counsel had started to draft Agreements in Principle for both compensation of class members and the long-term reform of the First Nations Child and Family Services program run by Canada. I was given the opportunity to review the compensation documents and provide input.

33. I understand that if there was no settlement, it could take a long time for this class action to make its way through the courts. The final settlement agreement provides compensation to the class members at this early stage in the litigation, rather than a long litigation process. The class action also provides a guaranteed outcome for eligible class members, which avoids the risk of being unsuccessful at trial.

34. This settlement agreement makes sense to me, and I support it. I appreciate that the process to apply for compensation is First Nations-led, culturally competent and trauma-informed supports will be available to the class.

35. I understand that the settlement includes four groups who will be entitled to direct compensation: (a) children taken into care and (b) their caregiving parents

and grandparents, (c) Jordan's Principle children and Trout children and (d) their caregiving parents and or grandparents.

36. I believe that discrimination is harmful to everyone who it impacts and that every class member will have had an experience that is informed by their own circumstances. It is important to me that the compensation mechanism approximates impacts and delivers more compensation to those who were more harmed by Canada's discriminatory conduct.

37. I support the approach that, for the Removed Child Family Class, members of the class who were the caregiving parents or grandparents at the time that the child was removed from the home and placed into care will be eligible for compensation. I also understand that if there are multiple parents who claim compensation, biological parents will receive compensation ahead of other types of parents, such as step-parents or caregiving grandparents. I understand that, due to the fixed compensation amount available, it is important to have safeguards for those who were likely most impacted. Most importantly, this will safeguard children from having to choose between their caregiving parents or grandparents, which will minimize trauma to the children. Given my experience with my adoptive family, I do not want any child to experience similar family dynamics for their caregivers to receive compensation. I support this approach to prioritizing compensation amongst members of the Removed Child Family Class.

38. I understand that, based upon the estimated number of caregiving parents and grandparents, Class Counsel have budgeted a base payment of $40,000 to

caregiving parents and grandparents. I also understand that this base payment may need to be altered if there are more caregiving parents and grandparents who are eligible for compensation than in the preliminary budget. I think it is important to ensure that people are treated as equally as possible, even if it means that all people receive less compensation individually.

39. I understand that this means that I may not receive direct compensation as a member of the Removed Child Family Class. However, this class action is not about me, and I have kept this front of mind during the negotiations and in talking to my lawyers. For me, it is important to prioritize the children who were most directly impacted by Canada's discriminatory conduct, which is the Removed Child Class and the parents from whom they were separated. I do not want to discount the impacts to all family members when a child is removed from the home, but my lawyers have explained the reasons for prioritizing caregiving parents and grandparents. I agree with the approach taken to compensating the Removed Child Family Class. I understand that individuals who do not receive compensation directly may be eligible for to benefit from grant-based supports under the cy-pres fund. I think this is a fair approach to ensure that all class members may benefit in some manner, while ensuring those who were most impacted receive meaningful compensation.

40. I understand that the settlement agreement does not include non-Status Indians or Metis (except for limited exceptions for the Jordan's principle class), but I also understand that they are free to pursue their claims against Canada on their own.

41. I understand that class members are releasing all claims against Canada in relation to this class action, including claims for sexual, physical or emotional abuse, but I also understand that survivors are free to pursue those claims against other individuals who may be legally responsible for these harms inflicted.

42. I understand that the settlement provides for a paper based confidential claims process that does not require any claimant to testify in a court, to undergo cross examinations or any questioning by an adverse party. I like the fact that this process, from what I understand from Ms. Osachoff, will be much quicker, simpler, and easier than if individuals had to share their individual stories in order to be eligible for compensation. I believe that settlement claims process will be much less traumatizing for class members.

43. I also understand that eligible class members whose claims are approved are guaranteed an individual compensation payment, though the amount for individuals other than the Removed Child Class and the Jordan's Principle Class who have been most impacted cannot be guaranteed. I understand from reviewing the settlement agreement and from my discussions with my lawyers, that the amount of the individual payments will be up to $40,000, $40,000 or more than $40,000, depending upon objective factors that allow for compensation that is proportional to the harms that they endured. I support this approach to compensation.

Honouraruim

44. Dianne Corbiere and Karen Osachoff have advised me that class counsel will be seeking court approval for the payment of honoraria to me and the other

representative plaintiffs for our service to the class. I will outline my work to date below as they asked that I address some of the factors the court might consider in making such an award.

45. I have been fully engaged in this case since I signed my retainer agreement with NC in January of 2020. I agreed to be a representative plaintiff in this case because I was concerned about what happened to me being removed from my family, my siblings being removed, and what had happened to other First Nations children. As a representative plaintiff for the Removed Child Family Class, I am very honoured to be trusted with such a great and impactful responsibility on behalf of First Nations children and youth in and from child welfare across Canada.

46. I have attended all representative plaintiff meetings with class counsel and the AFN. I have kept in regular contact with Ms. Osachoff with my questions and concerns. I attended mediation with Justice Mandamin as well as our negotiations with Justice Murray Sinclair.

47. My attendance at these meetings and litigating this case has required me to recount and relive the pain I experienced because of being removed from my family and community and the separation that I experienced from my siblings. With every meeting and engagement, I relive the hurt, pain and trauma of my own removal and the removal of my brothers and sisters. I am determined to fulfill my role as a representative of the Removed Child Family Class but this has been a very difficult role for me to fulfill.

48. I had to give up my privacy to fulfill this role as the country now knows what I went through. I do not want to be defined by my experiences related to the Removed Child Family Class. I do, however, wish to educate the wider Canadian public about what happened to us and the damage it inflicted. I ultimately decided to participate in Public Service Announcement (PSA's) at the cost of my own privacy, because I feel that I am helping my fellow class members which is integral to this case.

49. I have contributed my time and effort to successfully litigating this case and to negotiating a settlement that was responsive to the class members needs and wants.

2022 AFN ANNUAL GENERAL ASSEMBLY

50. Of most importance was that I attended the Annual General Assembly of the AFN in Vancouver, B.C. from July 4-9, 2022, and spoke at a Compensation Dialogue session as well as before the Chiefs in Assembly to speak about the Final Settlement Agreement as a representative plaintiff. I spoke from the heart about how important this case is for me and others who have experienced Canada's discrimination in child welfare. The importance of speaking publicly at the AFN Annual General Assembly cannot be understated. This is where we reach the Chiefs and their advisors, as well as the wider public (which includes our First Nations citizens) on the importance of settling this class action.

51. I make this affidavit in support of the relief sought in the Notice of Motion and for no other or improper purpose.

AFFIDAVIT OF ASHLEY DAWN LOUISE BACH
(affirmed September 6th, 2022)

I, Ashley Dawn Louise Bach, of the City of Thunder Bay, in the Province of Ontario, AFFIRM:

1. I make this affidavit in support of an application to obtain approval of the settlement agreement. I am one of the Representative Plaintiffs in the within action and as such have knowledge of the matters hereinafter deposed to. Where I make statements in this affidavit which are not within my personal knowledge, I have identified the source of that information and belief. All of the information I have deposed to I verily believe to be true.

2. In preparing to affirm this affidavit, I have reviewed, among other things, the Fresh as Amended Statement of Claim, the Consolidated Statement of Claim, the list of proposed common issues, and the proposed litigation plan. I have also reviewed the proposed Final Settlement Agreement as well as motion material for the Canadian Human Rights Tribunal and this court.

BACKGROUND

3. I was born in 1994 in Vancouver, British Columbia. My mother was a member of the Mishkeegogamang First Nation, in northern Ontario. Therefore, I am a First Nation person with Indian Status and membership in the Mishkeegogamang First Nation.

4. I was removed at birth from my mother and I was not placed on a Reserve. I was put into a non-native foster care home in Langley, British Columbia. While I was in care in 1996, my First Nation communicated they were unable to bring me home as they felt that "at this present time, that there is no possible means of providing the special needs required by this child, there is simply no resources or facilities in our community that would enable this child of the best care possible". At age five, I was adopted by this same non-native foster family, and I had no access to First Nation culture. I endured racism. In about 2012, at age eighteen, I left the hostile environment with my adopted family.

5. Since then, I have attempted to reconnect to my First Nation community, culture, language, and traditional territory. I have connected with some biological family members from my First Nation. Unfortunately, other biological family members passed away while I was still in the closed adoption, including my maternal grandmother, a residential school survivor who had requested to be "kept informed of what is happening with Ashley", and one of my uncles.

MY EFFORTS IN THIS CLASS ACTION

6. In early January 2020, the AFN approached me in my capacity as a board member and past President of Youth in Care Canada to help identify representative plaintiffs for a class action on discriminatory underfunding of First Nations Child and Family Services. I recommended several individuals but when these suggestions did not work out, the AFN asked me if I would be willing to be a representative plaintiff and I agreed.

7. At the time of accepting this responsibility, I knew there would be challenges before the end goal of fair and equitable compensation was reached. There was little academic and grey literature available to show how representative plaintiffs in similar class actions had been impacted but I knew there was risk of retraumatization. In actuality, the challenges I have experienced so far have been beyond what I and my legal counsel expected.

8. On or about January 24, 2020, I retained Nahwegahbow Corbiere ("NC") to represent me in this class action.

9. On January 28, 2020, this action was commenced by way of Statement of Claim. A Fresh as Amended Statement of Claim was filed with proof of service on March 6, 2020.

10. In July 2020, NC in collaboration with Fasken LLP agreed with counsel prosecuting the proposed class action in *Moushoom et al v Canada*, Court File No. T-402-19, namely Sotos LLP, Kugler Kandestin LLP, and Miller Titerle + Company, to join forces and advance the action as one proceeding (collectively, "Class Counsel").

11. I have received regular reports from NC and Fasken LLP since the commencement of this action. I have always felt I had current and relevant information from both law firms. I was updated on a regular basis via videoconference with the other representative plaintiffs and by telephone by Dianne Corbiere or her associate, Karen Osachoff. I was able to provide my input and feedback on the key components that I view as important for this settlement. I feel

that I have had current and relevant information from both of the law firms representing me, and the class. I am pleased with the representation that I received from both law firms.

12. Throughout this case I have:

a) Signed on with NC and signed a retainer agreement with them;
b) Agreed to be a representative plaintiff on behalf of the other class members;
c) Spoken with and attended many meetings with NC and Fasken LLP to discuss this case and my experience with being removed from my family permanently;
d) Provided instructions to NC and Fasken LLP; and
e) Reviewed and approved the settlement terms in this case.

13. I have been kept informed and provided input on various aspects of the lawsuit including settlement discussions that took place over the course of the lawsuit including at some of the mediation sessions with Justice Mandamin as well as a meeting with Justice Murray Sinclair which I view as a key moment in helping us reach agreement with the Government of Canada.

14. I have also attended more than 30 meetings over the past two and half years with NC, Fasken LLP and the AFN to discuss the class action and receive updates on the progress of the litigation. I have read all documents they have provided to me and gave regular input to reflect my views. I have asked questions and the lawyers have been responsive to my input.

15. In the future, I will continue to be involved in the case as necessary and will continue to speak to class members. I will ensure, through my lawyers, that the class is kept informed of any developments in this litigation.

DIRECT IMPACTS ON ME AS A REPRESENTATIVE PLAINTIFF

16. Immediately after the class action was filed, my relationships with my adoptive family members (parents, sibling, aunts and uncles, etc.) were negatively impacted as some were emotionally hurt that the class action was filed. My adoptive parents and I did not speak for almost a year after this and, while our relationship is now recovering, it is not where it once was.

17. I knew the class action would be stressful and bring up past trauma, however I did not expect to be negatively impacted to such a degree by the stress and retraumatization. For example, while our affidavits were being reviewed for consolidation, I was motivated to closely examine my child welfare files received in a Freedom of Information request. Within my files I learned of several traumatic things which I had not be told or was too young to remember, including but not limited to that:

(a) I was labeled as disabled with complex needs;

(b) my biological grandmother was unable to adopt me but asked to keep in touch with me (we were never put in touch and she passed away after I was adopted);

(c) my biological father had attempted to adopt me and was denied, and

(d) several of my aunts and uncles in Mishkeegogamang had attempted to adopt me and were denied.

18. I also learned that my First Nation had written letters to the government describing how they could not provide a home for me as they had not been provided the resources necessary to care for a child with complex need. It still deeply hurts me to know that my community had repeatedly attempted to bring me home but were unable to given the discriminatory underfunding of child welfare as well as other injustices such as the ongoing housing crises on many reserves.

19. My mental health has been negatively impacted as a result of being in child welfare and intergenerational trauma from residential schools and colonization, and this was exacerbated by the stress of the class action. The class action has impacted upon my mental health and has had an impact upon my ability to seek and keep full-time employment.

20. As well, the class action has interfered with my other responsibilities, which include co-chairing the Nishnawbe Aski Nation's Oshkaatisak (All Young Peoples') Council. I have missed Oshkaatisak Council meetings, events, and other responsibilities under the Council and my portfolios in order to speak with lawyers, review documents, and attend meetings on the class action (including these CHRT and Federal Court hearings).

21. I have also had to decline several major media opportunities (e.g. with Global National and CBC National) and generally limit my social media advocacy

on youth in care issues given there could be a risk of them touching on sensitive topics related to the class action.

22. Finally, I have been advised to decline certain job opportunities which may put me into a conflict of interest or compromise the class action. Until the class action is concluded this unfortunately impacts my presence and growth as a professional and limits potential speaking engagement or contract opportunities.

23. In sum, the class action has had a substantial impact on my family relationships, mental health, and career. While I do not regret becoming a representative plaintiff for the Removed Child Class and sincerely believe it is one of the most important ventures I will ever undertake, I do wish I could have known about and prepared for the extensive impacts on my life. I know these impacts will continue into the foreseeable future and while I am taking steps to mitigate them, they are still challenging to deal with everyday.

The Settlement Agreement is Fair and Reasonable

24. I knew before signing a retainer with my lawyers that the Government of Canada wanted to settle this case, as this decision was announced in November of 2019. A copy of this news article can be found at: https://www.cbc.ca/news/indigenous/child-welfare-class-action-1.5372281 and is attached as **Exhibit "A"** to my affidavit.

25. I have talked to my lawyers on multiple occasions, throughout this case about the settlement process and agreement. I knew that it was important to resolve this matter so that the class members could begin their process of healing.

26. My lawyers have always kept me informed of the status of settlement negotiations. We regularly discussed the negotiations and strategy by phone, text messages, zoom meetings and by email.

27. Between November 2020-January 2021, I attended court ordered mediation sessions before Justice Tony Mandamin to introduce myself and tell a bit of my personal history to the parties. This participation was at the request of Justice Mandamin.

28. When this mediation stalled, I was informed by Ms. Osachoff that my lawyers then agreed to attend negotiations to be chaired by the Honourable Murray Sinclair. I attended these negotiations session before the Honourable Murray Sinclair on November 9-10, 2021.

29. On December 13, 2021, the Government of Canada announced its intention to set aside nearly $40 billion to settle the CHRT matter, the class action and long-term reform of the First Nations child welfare system over a five-year period. A copy of this news article can be found at: https://www.cbc.ca/news/politics/ottawa-indigenous-child-welfare-compensation-offer-1.6283952 and is attached to as **Exhibit "B"** to my affidavit.

30. Prior to this, I had been informed by Ms. Osachoff that Class Counsel had started to draft Agreements in Principle for both compensation of class members and the long-term reform of the FNCFS program. I was given the opportunity to review these documents and provide input to them.

31. I am very happy that the parties have reached agreement on compensation in this settlement agreement. Although I do not understand all the legal arguments in this case, I understand that there is legal risk to all legal proceedings and that continuing with litigation can take a long time, no matter how strong the case. I agree that this is a fair settlement that will most likely grant compensation to thousands of people like me. It provides a guaranteed positive outcome for eligible class members and avoids the risk of being unsuccessful at trial.

32. I also understand the settlement agreement creates a cy-pres fund to provide benefits for class members, including those that may not be eligible for direct compensation. I provided direct input to the stated purposes of the cy-pres fund in the settlement agreement. This fund will, among other things, provide for culturally sensitive and trauma-informed relief and assistance to the class where unmet needs may exist. These unmet needs could include family reunification and the costs associated with travel as well as transitional support to youth in care who are aging out and cultural programming. I think this is an important aspect of the settlement to ensure that there is an opportunity to benefit those people who may not receive direct compensation.

33. This settlement agreement makes sense to me and I support it. I appreciate that the process to apply for compensation is First Nations-led and culturally competent and that trauma-informed supports will be available to the class.

34. I understand that the settlement includes four groups who will be entitled to direct compensation: (a) children taken into care and (b) their caregiving parents and grandparents, (c) Jordan's Principle children and Trout children and (d) their caregiving parents and or grandparents.

35. For children taken into care, this class includes all First Nations individuals who were under the age of majority who were taken into out-of-home placement under the Government of Canada's FNCFS Program between April 1, 1991 and March 31, 2022 and who were ordinarily resident on a reserve, or were living on-reserve or in the Yukon. I also understand that caregiving parents and or caregiving grandparents will also be eligible for direct compensation.

36. I understand that the settlement agreement does not include non-Status Indians or Metis (except for limited exceptions for the Jordan's principle class), but I also understand that they are free to pursue their claims against Canada on their own.

37. I am supportive of the fact that children who were removed and placed into care as a result of Canada's discriminatory conduct will receive a minimum of $40,000 in compensation under this settlement agreement. It is important to me that those children who were separated from their families and placed into care receive additional compensation that is proportional to the impacts it has had. While

everyone suffered as a result of separation from their families, I also recognize that some children who were, for example, in unstable situations, from remote communities or removed multiple times and placed into care may have had greater impacts upon them. I think it is important to recognize that, while all children deserve compensation, some have suffered even more as a result of their specific experiences.

38. I also understand the importance of minimizing the risk of retraumatizing individuals and avoiding forcing children to search through their records to prove their claims. I understand that the settlement provides for a paper based confidential claims process that does not require any claimant to testify in a court, to undergo cross examinations or any questioning by an adverse party.

39. Given my difficulties in obtaining my own files and records, I do not want any other child to have to go through this to receive compensation. I am happy that the settlement agreement does not require other foster kids to prove their claims by providing documentation that will be difficult or impossible for them to obtain.

40. I believe that settlement claims process will be much less traumatizing for class members than a trial, and they will receive compensation much more quickly than if this class action were to proceed to a trial.

41. I understand that class members are releasing all claims against Canada in relation to this class action, including claims for sexual, physical or emotional abuse, but I also understand that survivors are free to pursue those claims against

other people, including other levels of government or child welfare agencies who may have caused them harm.

42. I further understand from reviewing the settlement agreement and from my discussions with my lawyers that the government of Canada committed to using its best efforts to obtain the agreement of the provinces and territories and various federal government departments that receipt of any payments to a class member made pursuant to the agreement will not affect the quantity, nature and duration of any social benefits or social assistance benefits payable to them.

43. I also understand that the government of Canada committed to treating any payments under this compensation as non-taxable income and that Canada will make best efforts to obtain a technical interpretation to the same effect from the Income Tax Rulings Directorate of the Canada Revenue Agency. I think this is an important step to ensure that children receive as much of the compensation they deserve as possible.

STATEMENT OF WORK RELEVANT TO HONORARIUM

44. Dianne Corbiere and Ms. Osachoff have advised me that class counsel will be seeking court approval for the payment of honoraria to me and the other representative plaintiffs for our service to the class. Although I am not sure at this time if I wish to receive this honouraruim I will outline my work to date below as they asked that I address some of the factors the court might consider in making such an award.

45. I have been fully engaged in this case since I signed my retainer agreement with Nahwegahbow, Corbiere in January of 2020. I agreed to be a representative plaintiff in this case because I was concerned about what happened to me being removed from my family and what had happened to other Indigenous children. As a representative plaintiff for the Removed Child Class, I am very honoured to be trusted with such a great and impactful responsibility on behalf of First Nations children and youth in and from child welfare across Canada.

46. I have attended all representative plaintiff meetings with class counsel and the AFN. I have kept in regular contact with Ms. Osachoff with my questions and concerns. I attended mediation with Justice Mandamin as well as our negotiations with Justice Murray Sinclair.

47. My attendance at these meetings and litigating this case has required me to recount and relive the pain I experienced because of being removed from my Anishinaabe family and community. With every meeting and engagement, I relieve the hurt, pain and trauma of my removal and I still feel like that lost foster child. I am however, determined to fulfill my role as a representative of the Removed Child Class but this has been a very difficult role for me to fulfill.

48. My responsibilities as a representative plaintiff for the Removed Child Class has imposed costs on which I would have preferred to have avoided, to which other class members will avoid. I also had to give up my privacy to fulfill this role as the country now knows what I went through, and many people are relying on me to get this settlement right. I do not want to be defined by my experiences related

to the Removed Child Class. I do, however, wish to educate the wider Canadian public about what happened to us and the damage it inflicted. I ultimately decided to participate in Public Service Announcement (PSA's) at the cost of my own privacy, because I feel that helping my fellow class members is integral to this case.

49. I have spoken with many youths who are or may be class members and they have shared with me their experience of being taken from their families and communities, and the long-term impacts that has had on them. I have contributed my time and effort to successfully litigating this case and to negotiating a settlement that was responsive to the class members needs and wants.

2022 AFN ANNUAL GENERAL ASSEMBLY

50. Of most importance was that I attended the Annual General Assembly of the AFN in Vancouver, B.C. from July 4-9, 2022, and spoke at a Compensation Dialogue session as well as before the Chiefs in Assembly to speak about the Final Settlement Agreement as a representative plaintiff. I spoke from the heart about how important this case is for me and others who have experienced Canada's discrimination in child welfare. The importance of speaking publicly at the AFN Annual General Assembly cannot be understated. This is where we reach the Chiefs and their advisors, as well as the wider public (which includes our First Nations citizens) on the importance of settling this class action.

51. I make this affidavit in support of the relief sought in the Notice of Motion and for no other or improper purpose.

AFFIRMED BEFORE ME over video teleconference on this 6th day of September, 2022, in accordance with O. Reg 431/20, Administering Oath or Declaration Remotely. The Commissioner was in Barrie, Ontario and the affiant was in Thunder Bay, Ontario.)

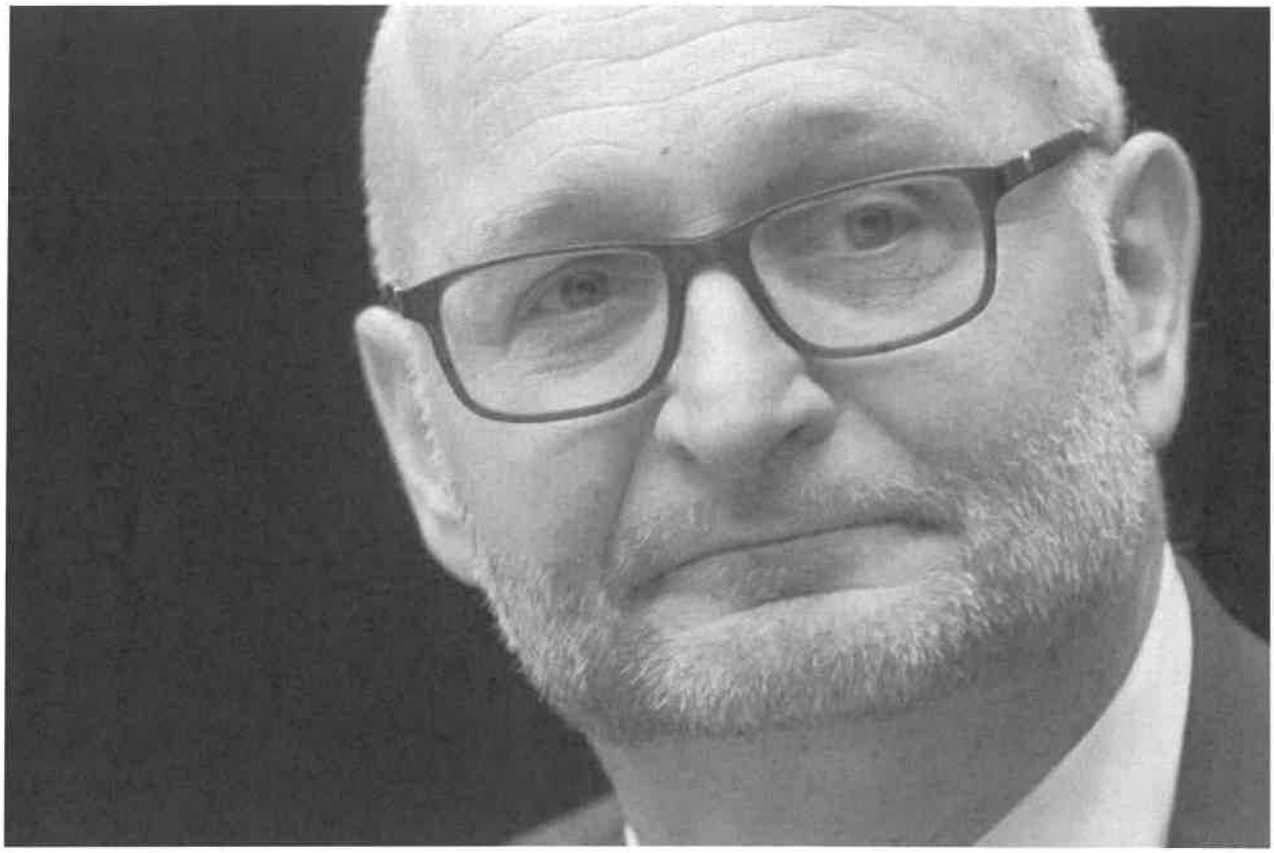
Federal ministers announce move to settle as courtroom arguments begin over tribunal compensation order

Jorge Barrera · CBC News · Posted: Nov 25, 2019 12:59 PM ET | Last Updated: November 25, 2019



Justice Minister David Lametti announced Monday the government would work with the plaintiffs of a class action over failures in the First Nations on-reserve child welfare system. (Adrian Wyld/The Canadian Press)

The Trudeau government announced Monday it's planning to settle a class-action lawsuit filed on behalf of First Nations children affected by the on-reserve child welfare system, while its lawyers launched arguments in a courtroom aimed at torpedoing a human rights tribunal order that it pay compensation to many of the same affected children.

Justice Minister David Lametti and Indigenous Services Minister Marc Miller issued a joint statement that the government would work with plaintiffs' counsel with the goal of moving forward with certification of a class action filed in March. It seeks $6 billion in compensation for First Nations children impacted by the on-reserve child welfare system and who were denied health services.

"The Government of Canada is committed to seeking a comprehensive settlement on compensation that will ensure long-term benefits for individuals and families and enable community healing," the statement said.

"The class action model is designed to give individuals the chance to have their interests represented, to address the interests of all impacted individuals and to allow parties to arrive at an appropriate resolution of past harms."

- **Ottawa in court this week over First Nations child-welfare compensation order**
- **Ottawa in talks to settle First Nations child welfare class action lawsuit**

Under Jordan's Principle, the needs of a First Nations child requiring a government service take precedence over jurisdictional issues over who should pay for it.

David Sterns, a partner with Toronto-based Sotos LLP, one of three law firms bringing forward the lawsuit, said he was notified Monday morning of the federal government's intention to proceed with certification.

The three law firms brought the action on behalf of Xavier Mushroom and Jeremy Meawasige — the representative plaintiffs in the case.

"This is a positive development. Agreement to certification means we have the forum to pursue a global resolution that will be subject to court approval," said Sterns.

"We view it as a positive. So far, these are just words. They need to match their words with action."

Sterns said any settlement would eventually involve the parties to the human rights tribunal case, which include the First Nations Child and Family Caring Society and the Assembly of First Nations.

Indigenous Services Minister Marc Miller said the Trudeau government has a solid track record dealing with historical wrongs inflicted on Indigenous children by Ottawa's historic policies through class-action settlements. Miller pointed to recent settlements around the Sixties Scoop and Indian day schools.

We have shown good faith in engaging with families, with victims, in ensuring this compensation is properly and fairly addressed," said Miller.

"We are committed to compensation; we do not deny the discrimination."

Watch Marc Miller on Power and Politics:

Minister of Indigenous Services Marc Miller on why his government is challenging a human rights tribunal order that the federal government compensate First Nations children affected by the on-reserve welfare system.

Fighting tribunal order

The two ministers issued the statement about the class-action suit as federal government lawyer Robert Frater told Federal Court Justice Paul Favel the Sept. 6 Canadian Human Rights Tribunal order — that Ottawa provide $40,000 in compensation to each First Nations child impacted by the child-welfare system or denied health services — was an overreach.

The compensation order, which also includes payments of at least $20,000 to some parents and grandparents, followed a 2016 ruling that found Ottawa discriminated against First Nations children by underfunding child-welfare services and by not following Jordan's Principle.

Frater was arguing for a motion seeking a stay — a pause — of the tribunal compensation order until the Federal Court decided on a judicial review filed in October by Ottawa.

"The errors of this [tribunal compensation] judgment run wide and deep," said Frater, in his arguments.

"Canada is committed to remedying the injustices of the past, but it has to be done in a fair and equitable way."

Frater argued that the case before the tribunal, originally filed in 2007, was about systemic discrimination, which required a systemic fix that the federal government had already begun. He also said the compensation order wandered outside of the tribunal's legislative parameters into the purview of class-action law.

He said the compensation order was fundamentally unfair because it treated all cases the same, regardless of individual circumstance.

"There ought to be some sort of recognition of individual experience," Frater said.

Ignoring the continuing tragedy

Barb McIsaac, a lawyer for the First Nations Child and Family Caring Society, told the court that while the government says it favours compensation, its actions haven't matched its words.

"My friend has stated over and over again, as have various politicians, that Canada wants to compensate the children, but it hasn't done anything yet."

The Caring Society, which was the lead on the human rights complaint, argued that the court should put a freeze on the judicial review until the tribunal decides on the process to distribute the compensation.

The tribunal set Dec. 10 as the deadline for all parties to submit proposals on the mechanism for distributing the compensation.

"The court can only fully understand and rule on the reasonableness of the compensation once all aspects of the compensation decisions have been determined by the tribunal," McIsaac said.

"The arguments of the attorney general are not in the best interest of the children, but rather in this argument that we have to have perfection. If we wait for perfection, we'll be here again and again and again, and we'll never have a solution."

Cindy Blackstock, left, leads the First Nations Child and Family Caring Society, and Perry Bellegarde is the national chief for the Assembly of First Nations. The Caring Society and the AFN launched a human rights complaint over on-reserve child welfare services in 2007. (Sean Kilpatrick/The Canadian Press)

Cindy Blackstock, who heads the Caring Society, said the government is ignoring the continuing tragedy inflicted on First Nations children by the systemic discrimination exposed by the human rights tribunal.

"So this waiting around might make sense for them bureaucratically or even politically," Blackstock said.

"But for these children, they will never get their childhoods back, and in some cases they'll never get their lives back, and in some cases

they'll never get their families back, and that is what Canada isn't paying attention to."

NDP MP Charlie Angus, who attended the Monday hearing, said the Trudeau government needs to drop its challenge of the tribunal's compensation order.

"The damage that this system has done is incalculable and yet the Government of Canada is here with all their lawyers, with all their power, to fight yet once again a basic finding that they've been discriminating against children," Angus said.

Class action move 'political obfuscation'

Julian Falconer, the lawyer acting on behalf of Nishnawbe Aski Nation, which intervened in the case, said the government's argument that the tribunal ruling covers too few people rings hollow.

"There is a simple answer to that — accept the order and then compensate others," said Falconer, who was acting on behalf of an organization that represents 49 northern Ontario First Nations — some of the poorest in the country.

"There is nothing stopping Canada from adding to the compensation."

Blackstock said the move by the federal government to announce it was proceeding with the class-action lawsuit rang "of political obfuscation and putting this downstream." Blackstock said the class action actually leaves people out because it doesn't include the parents or grandparents of apprehended children in its statement of claim.

"It doesn't deal with the pain and suffering that their families went through," said Blackstock.

"It's the same old story where they're saying they'll talk about things. There's no commitment to change children's lives."

The hearing continues Tuesday.

'This is 30 years of the cost of failure, and that cost is high,' Crown-Indigenous Relations Minister says

Olivia Stefanovich · CBC News · Posted: Dec 13, 2021 1:30 PM ET | Last Updated: December 13, 2021

A student walks past a display at Ottawa's Hillcrest High School on Canada's first National Day for Truth and Reconciliation on Sept. 30, 2021. (Blair Gable/Reuters)

The federal government announced today it is setting aside $40 billion in its fall economic update for First Nations child welfare as it continues talks on settling compensation claims.

The money is to cover the cost of settling a Canadian Human Rights Tribunal order, two class action lawsuits and long-term reform of the Indigenous child welfare system over a five year period.

"It's a positive announcement, but what we need to see how this actually lands in terms of payments for children and families," said Cindy Blackstock, the executive director the First Nations Child and Family Caring Society.

In 2019, the tribunal ordered Ottawa to pay $40,000 — the maximum allowed under the Canadian Human Rights Act — to each child, along with their primary guardian, who attended on-reserve child welfare system from at least Jan. 1, 2006, to a date to be determined by the tribunal.

It also directed the federal government to pay $40,000 to each First Nations child, along with their primary guardian, who was denied services or forced to leave home to access services covered by the policy known as Jordan's Principle.

WATCH | Miller on compensation plans:

Minister of Crown-Indigenous Relations Marc Miller responds to questions about the government's plan to address Indigenous child welfare compensation. CBC

News has learned the federal government is setting aside $40 billion in its fall economic update and that will be announced on Dec. 14.
"We reflect on 30 years of failure and discrimination toward Indigenous children in the child welfare system," Crown-Indigenous Relations Minister Marc Miller told reporters at Parliament Hill.

"This is 30 years of the cost of failure, and that cost is high."

Miller said the $40 billion figure has not been finalized. He pointed to ongoing "fragile conversations" taking place between the federal government and Indigenous leaders, which could alter how much the government eventually offers.

The $40 billion would be split "roughly" evenly between compensation for children and families who were once in the system, and long-term changes to the child welfare system.

Miller said the goal of those changes is "to make sure we are not repeating the model that has ripped children from their families into care."

The parties have agreed to negotiate until a self-imposed deadline of Dec. 31.

Cindy Blackstock, executive director of the First Nations Child and Family Caring Society of Canada, has been trying to get the federal government to compensate First Nations children since 2007. (Simon Gohier/CBC)

If a final deal isn't reached, they could be heading back to court to hear the federal government's appeal of a Federal Court ruling, which upheld the tribunal order. The parties agreed to put litigation on hold while they try to strike an agreement.

Blackstock, who filed the original complaint with the Assembly of First Nations (AFN) in 2007, said the fight won't be over until discrimination against First Nations children ends.

"If we can stop it, it will be the first time since Confederation that a generation of First Nations kids don't have to grow up spending their whole childhood trying to be treated equally as other kids in public services," she said.

'Money does not mean justice'

The AFN welcomed the government's commitment.

"There's not enough money ever to repair the harms that the system has done to people," said AFN Manitoba Regional Chief Cindy Woodhouse, who is in the negotiations.

"I don't think any amount of money is ever going to change that brokenness ... But it shows that there was harm done and we have to find a path forward."

- **B.C. Indigenous leaders 'disgusted' by Ottawa's foster care compensation appeal, as feds vow talks**
- **Ottawa will appeal court ruling on Indigenous child welfare but says it's pursuing a compensation deal**

It was the AFN that in 2020 filed a lawsuit against the federal government seeking compensation for Indigenous children and families harmed by the child welfare system.

"The magnitude of the proposed compensation package is a testament to how many of our children were ripped from their families and communities," said AFN Chief RoseAnne Archibald in a media statement.

"Money does not mean justice. However, it signals that we are on the healing path forward as we finalize long term reform to ensure we meet our vision of children surrounded by the love and care of their families, living in safe and vibrant communities."

AFFIDAVIT OF KAREN OSACHOFF
(affirmed September 5, 2022)

I, Karen Osachoff, of the community of Rama, in the Province of Ontario, AFFIRM:

1. I make this affidavit in support of an application to obtain approval of the settlement agreement. I am one of the Representative Plaintiffs in the within action and as such have knowledge of the matters hereinafter deposed to. Where I make statements in this affidavit which are not within my personal knowledge, I have identified the source of that information and belief. All of the information I have deposed to I verily believe to be true.

2. In preparing to affirm this affidavit, I have reviewed, among other things, the Fresh as Amended Statement of Claim, the Consolidated Statement of Claim, the list of proposed common issues, and the proposed litigation plan. I have also reviewed the proposed Final Settlement Agreement as well as motion material for the Canadian Human Rights Tribunal and this court.

BACKGROUND

3. I am a member of the Pasqua First Nation, located in Treaty No. 4 territory.

4. I was apprehended by Saskatchewan Social Services and adopted by a non-First Nations family in 1982.

5. I grew up in Saskatoon, Saskatchewan with my non-First Nations adoptive family until the age of eleven.

KO

6. Beginning in 1990 at the age of eleven years old, I began running away from my adoptive family and was re-apprehended multiple times by Saskatchewan Social Services. I ran away to the streets of Saskatoon so I could be around First Nations people. I know now that my spirit compelled me to be with my own people but at the time, I just ran.

7. During this time, I was gravely misunderstood by my parents, police officers and social workers as they did know or understand intergenerational trauma, effects of the residential schools and the Sixties Scoop that had led to my initial apprehension in the early 1980's. They instead blamed and labelled me as a problem child, who was "emotional disturbed", and in need of more strict rules and control instead of the care and companionship of my family and community.

8. I never lived with my adoptive family permanently again. From the age of eleven to eighteen, I lived in multiple foster homes, with periods of being homeless on the streets.

9. When I was fifteen years old, I reconnected to my biological family, which included: my mother Beverly, my sister's Dawn and Kendra, as well as my brother Sheldon. I learned that I had two brothers that had passed away before I reconnected with my family. I never knew about my sister Melissa, who is a representative plaintiff in this class action, or my brothers Ovide and Cory.

10. I also have three sisters from my biological father's side of the family who I have reconnected with. I have yet to meet one of my sisters in-person and one has since passed away. As with my mother's side of the family, my relationships with

K.O

my father's side of the family are strained at times due to the severing of the family bond years ago.

11. Although I was very happy to meet both sides of my biological families, it was hard to reconnect with them as our bond had been broken years earlier. Some of them judged me as "white" and some of them do not accept me fully as a member of their family. I was never close to any of them except for my brother Sheldon, who has since died.

12. My teenage years were a very confusing and painful time for me, and I drank alcohol and used marijuana and various elicit drugs to cope with my emotions and circumstances. I was abused sexually, mentally, emotionally, and physically while in care and while I was homeless.

13. At the age of eighteen, I aged out of foster care/social assistance and was left to my own devices. I still wasn't out of the dark and remained in a dark, scary, and lonely place until I moved to Coast Salish territory (also known as Vancouver, British Columbia) when I was twenty years old in 1999.

14. In Coast Salish territory, I connected with healthy and caring First Nations people for the first time in my life. I began participating in cultural ceremonies, addiction recovery services and I eventually passed my General Education Development (GED) course. I then started college and university and received my Bachelor of Arts degree and eventually, a Juris Doctor degree.

K.O

15. I worked in the downtown east side of Vancouver for ten years while I was completing my studies and have worked at several organizations which include: the Vancouver Police Department (Native Liaison as it then was), the Native Courtworkers and Counselling Association of British Columbia, the Atira Women's Resource Society, and Battered Women's Support Services.

16. In all these roles, I was able to use my personal history and circumstances to be able to connect easily to our clientele, which included many First Nations people. This is not a skill that many students, advocates, or lawyers have. I know now that this personal history and circumstances makes me a better lawyer because I have experienced the effects of intergenerational trauma and being a Sixties Scoop survivor. I am also informally trained in my Cree culture, in addition to my formal education.

MY EFFORTS IN THIS CLASS ACTION

17. In December 2019, my former boss Dianne Corbiere of Nahwegahbow Corbiere ("NC") called me to ask if I would consider being a representative plaintiff for a class action regarding Canada's discriminatory underfunding of First Nations Child and Family Services and my permanent removal from my biological family. While I had some apprehensions, I agreed to be a representative plaintiff for the Removed Child Class.

18. On or about February 3, 2020, I retained NC to represent me in this class action.

K.O

19. On January 28, 2020, this action was commenced by way of Statement of Claim. A Fresh as Amended Statement of Claim was filed with proof of service on March 6, 2020. I was appointed a representative plaintiff for this class action to represent the interests of the Removed Child Class.

20. On June 15, 2020, I re-joined the law firm of NC as a lawyer, in addition to my role as representative plaintiff. Prior to this date, I had left NC for two and a half years to represent a delegated First Nations Child and Family Services Wellbeing Agency located in Ontario. While I enjoyed aspects of this child welfare work, I soon realized that I could not participate in the apprehension of First Nations children, even if it was our people doing it, due to my history of being apprehended, first in the Sixties Scoop and later when my adoptive home broke down.

21. I had worked at NC since April 2011 when I joined them as an articling student. Except for my two-and-a-half-year employment at the delegated First Nations Child and Family Services Wellbeing Agency, I have worked as a lawyer under Dianne Corbiere since June 2012 when I was called to the Ontario Bar.

22. In July 2020, NC in collaboration with Fasken LLP agreed with counsel prosecuting the proposed class action in *Moushoom et al v Canada*, Court File No. T-402-19, namely Sotos LLP, Kugler Kandestin LLP, and Miller Titerle + Company, to join forces and advance the action as one proceeding (collectively, "Class Counsel").

23. I have given regular reports from NC to the representative plaintiffs since the commencement of this action. During the mediation/negotiations that took

K.O

place from November 2020 to December 2021, Dianne Corbiere and I gave regular updates via videoconference with the other representative plaintiffs and by telephone.

24. From the commencement of this class action, I knew that the claim was going to be difficult and challenging. At this time, I had already experienced a re-traumatization of my child welfare history being part of the Sixties Scoop settlement process while working at the delegated First Nations Child and Family Services Wellbeing Agency, so I was aware of how hard this case would be on me personally. But I also knew that my skillset as a lawyer, a survivor of the child welfare system, and having experience with the Sixties Scoop settlement process would be invaluable to this class action. I knew that I could reach our class members personally and ensure that our class action settlement process was better than previous ones. I knew that I had a story to tell and I also wanted to save another survivor from having to experience this class action as a representative plaintiff, as I knew how traumatic a role like this would be.

25. Throughout this case I have:

(a) Signed on with NC and signed a retainer agreement with them;

(b) Agreed to be a representative plaintiff on behalf of the other class members;

K.O

(c) Spoken with and attended many meetings with NC, the AFN and Fasken LLP to discuss this case and my experience with being removed from my biological family permanently;

(d) Provided instructions to NC and Fasken LLP; and

(e) Reviewed and approved the settlement terms in this case.

26. Dianne Corbiere and I have regularly kept the other representative plaintiffs informed of the process and I have provided input on various aspects of the class action including settlement discussions that took place over the course of the negotiation, including at some of the mediation sessions with Justice Mandamin. I also attended a meeting with Justice Murray Sinclair as a representative plaintiff, which was a key moment in reaching agreement with the Government of Canada. I have regularly discussed the negotiations and strategy by phone, text messages, zoom meetings and by email to the representative plaintiffs and well as the NC and Fasken legal teams.

27. I have also attended countless meetings over the past two-and-a-half years with NC, Fasken LLP and the AFN staff responsible for this file to discuss the class action and provide/receive updates on the progress of the litigation. I have assisted drafting all documents we provided to the representative plaintiffs.

28. In the future, I will continue to be involved in the class action as class counsel and a representative plaintiff and will continue to speak to class members.

KO

29. I am currently answering the 1-800 number that we have set up as AFN class counsel to answer questions on the class action settlement process. I enjoy talking to and with our potential class members and will continue to do so. As I said earlier in this affidavit, I know that this is one of my strengths as a lawyer. Not only am I able to explain the legal process, I am also trauma informed and culturally competent due to my knowledge of our collective cultures and my participation as a claimant in a previous class action. I know of no other lawyer on our team who can do this. In fact, I know of no other class action that has had someone like me working on it.

30. I have carefully respected my roles both as class counsel and representative plaintiff. I have not been involved in compensation discussions that involved the decision to allocate certain budgets to specific classes. As explained below, to respect the division of my roles, I will not be submitting a claim for compensation as a member of the Removed Child Class. However, as a representative plaintiff and as legal counsel, I have worked hard to obtain the best result possible for the class overall and obtain a settlement that grants as much compensation as possible to survivors who have been impacted by Canada's discrimination.

THE SETTLEMENT AGREEMENT IS FAIR AND REASONABLE

31. I have provided regular updates to the representative plaintiffs throughout this class action about the settlement process and agreement. From the beginning, I knew that it was important to resolve this matter so that the class members could

K.O

begin their process of healing and receive compensation in recognition of the trauma and impacts that they have endured.

32. In November 2021, I participated in drafting the Agreement in Principle for compensation of class members.

33. I am beyond happy that the parties have reached agreement on compensation in the Final Settlement Agreement. The Final Settlement Agreement provides compensation to the class members at this early stage in the litigation, rather than a long litigation process. The settlement also provides a guaranteed outcome for eligible class members who avoid the risk of being unsuccessful at trial.

34. I and our AFN team have ensured that the process to apply for compensation was First Nations-led, culturally competent and that trauma-informed supports would be available to the class both before, during and after the compensation process is complete.

35. I had already experienced a class action settlement process (Sixties Scoop) that was not First Nations-led, culturally competent, or trauma-informed, and I and the other claimants suffered greatly for it. I had to leave work for an eight-month stress leave and no one except my First Nations therapist understood what I was going through. I am still recovering from that experience, but I knew I had to use this negative experience to ensure our class members were better supported for this class action. I believe we have fulfilled this goal.

K.O

36. Of great importance to me as a representative of this class, is that the Removed Child class will be eligible to receive compensation. We have budgeted $7.25 billion for the Removed Child Class and $5.75 billion for the Removed Child Family Class. I know this approach to compensating the Removed Child Class and the Removed Child Family Class is a fair settlement, as the families whose children endured the greatest impact also will have endured personal hardship due to Canada's discrimination.

37. While I understand that not all family members will receive direct compensation, I agree with this team decision, as it is important to give more compensation to those who have experienced the most impact. As a member of the legal counsel team, to prioritize compensation for the children, we had to make some tough decisions during the negotiation process. This Class Action has always been about the children first. Family members who have been impacted by Canada's discrimination in relation to Removed Child but do not receive direct compensation may receive indirect benefits through the cy-pres fund.

38. This settlement provides for a paper based confidential claims process that does not require any claimant to testify in a court, to undergo cross examinations or any questioning by an adverse party. I believe this is very important and will reduce the barriers that individuals face to claiming their compensation. This will be much less traumatizing for class members than a claims process that involves interviews and challenges to peoples' memories. I fully support the goals of the settlement agreement with respect to minimizing the trauma that claimants will face to claim compensation.

KO

HONOURARUIM

39. As both a representative plaintiff and class counsel on this class action, I do not wish to receive an honourarium for my work as a representative plaintiff. I will also not be applying for compensation as a Removed Child Class member.

40. I am declining both the honouraruim and the compensation as a Removed Child Class member as I am being paid as class counsel. I believe this is the honourable and correct thing to do to avoid any notion of a conflict. I was not involved directly with the Removed Child Class compensation amounts or the allocation of a budget of overall compensation to this class.

41. I have been fully engaged in this case since I signed my retainer agreement with NC in February of 2020 and when I joined NC as AFN class counsel on June 15, 2020. I agreed to be a representative plaintiff in this case because I was concerned about what my family and I had endured and what had happened to other First Nations families. As a representative plaintiff for the Removed Child Class, I am very honoured to be trusted with such a great and impactful responsibility on behalf of First Nations families across Canada.

42. I have participated in all representative plaintiff meetings with class counsel and the AFN.

43. I also had to give up my privacy to fulfill this role, as the country now knows what I and my family went through. I ultimately decided to participate in Public Service Announcements that will be published on the AFN website at the cost of

KO

my own privacy, because I feel that helping my fellow class members is integral to this case.

44. I have contributed my time and effort (as well as my blood, sweat and tears) to successfully litigate this case and to negotiate a settlement that was responsive to the class members needs and wants.

2022 AFN ANNUAL GENERAL ASSEMBLY

45. Of most importance was that I attended the Annual General Assembly of the AFN in Vancouver, B.C. from July 4-9, 2022, and spoke at a Compensation Dialogue session as well as before the Chiefs in Assembly to speak about the Final Settlement Agreement as a representative plaintiff. I spoke from the heart about how important this case is for me and others who have experienced Canada's discrimination in child welfare. The importance of speaking publicly at the AFN Annual General Assembly cannot be understated. This is where we reach the Chiefs and their advisors, as well as the wider public (which includes our First Nations citizens) on the importance of settling this class action.

46. I make this affidavit in support of the relief sought in the Notice of Motion and for no other or improper purpose.

AFFIDAVIT OF JANICE CIAVAGLIA
(Affirmed on September 6, 2022)

I, Janice Ciavaglia, of Ottawa in the Province of Ontario AFFIRM THAT:

1. I am the Chief Executive Officer of the Assembly of First Nations (hereinafter the "AFN") and, in that capacity, have personal knowledge of the matters to which I hereinafter affirm and wherever so stated I verily believe them to be true. I have been involved with the AFN's proceedings before the Canadian Human Rights Tribunal under the style of cause *First Nations Child and Family Caring Society v. Attorney General of Canada*, CHRT File No. T1340-7008, and have been actively involved in negotiations leading to the proposed settlement of this class action. As such, I have personal knowledge of the facts hereinafter deposed to except where stated to be on information and belief, in which case I verily believe them to be true.

2. The AFN is a national organization which advocates on behalf of First Nation citizens in Canada, which includes more than 1,008,955 people living in 634 First Nation communities and in cities and towns across the country.

3. In accordance with the AFN Charter and resolutions passed by the Chiefs-in-Assembly, the AFN advocates for First Nations in a range of fora and processes, including the United Nations. The AFN advocates on areas including Aboriginal and treaty rights, self-determination, upholding the honour of the Crown, land claims, economic development, education, languages and literacy, health, housing, social development, justice, taxation, and the environment. The Chiefs meet semi-annually to set national policies and directions through resolutions.

4. In keeping with its mandates, the AFN advocates and promotes the unique and respective nation-to-nation relationship between the Crown and diverse First Nations as Peoples and nations. This relationship is manifested in treaties and other legal instruments and the inherent rights of First Nations as Peoples with an equal right to self-determination as set out in *United Nations Declaration on the Rights of Indigenous Peoples*. The AFN advocates and promotes the restoration and enhancement of these relationships to ensure the full respect and implementation of First Nations collective rights as Peoples and nations. In the Preamble to the AFN Charter, the AFN has resolved "to employ national and international machinery for the promotion of the political, economic and social advancement of our people."

5. The AFN Social Development Sector has been heavily involved in conducting and coordinating research and advocating for changes in the federal government's First Nations Child and Family Services Program ("FNCFS Program") and Jordan's Principle. The AFN filed this class action proceeding to advocate for its constituents and in order to avoid the mistakes of past class action settlements.

6. I also want to acknowledge that compensation alone cannot and will not bring back the lost childhoods of generations of First Nations children or the time lost with their families. It can also not bring about healing or justice for these children and their families, nor is it reflective of true reconciliation. There is no amount of compensation that could accomplish this. Compensation pursuant to the Final Settlement Agreement is, however, an effort to acknowledge and begin to redress the significant harm that decades of discriminatory policies and practices have had on First Nations children, families and communities. Actual efforts to end discrimination with respect to child welfare reform took place with the enactment of Bill C-92, *An Act respecting First Nations, Inuit and Métis children, youth and families*. Also, AFN is a main party working to settle the rest of the matters in the *First Nations Child and Family Caring Society v. Attorney General of Canada*, CHRT File No. T1340-7008. All efforts are intended to end Canada's discrimination in the FNCFS Program and Jordan's Principle

7. I further want to acknowledge the decades of work by First Nations leadership, Elders, advocates and youth that have laid the foundation for this historic settlement, and who have touched the lives of tens of thousands of First Nations families.

8. The AFN has been a leading advocate in FNCFS Program reform. Since 1998, the AFN has been involved in the development of various joint AFN-Canada reports and reviews, such as the National Policy Review, published in 2000, and two reports known as the Wen:De reports published in 2005, as well as the First Nations component of the Canadian Incidence Studies. These reports identified significant deficiencies and inequities inherent in the then Department of Indian Affairs and Northern Development (now Indigenous Services Canada or "ISC") funding for the FNCFS Program and the adverse impacts on First Nations children and families, including the ongoing overrepresentation of First Nations children in care.

9. Despite the overwhelming evidence of inherent problems within the FNCFS Program, Canada made two modifications to the program which did not adequately improve the program. As a result of Canada's inaction, Phil Fontaine, the then National Chief, instructed the AFN to file a complaint under the Canadian Human Rights Act. The AFN and First Nations Child and Family Caring Society of Canada's ("Caring Society") joined together and jointly filed the 2007 complaint with the Canadian Human Right Tribunal ("CHRT") alleging discrimination in the provision of a service. The CHRT issued its landmark ruling in this matter on January 26, 2016, substantiating the complaint. Canada was ordered to cease its discriminatory practices, reform its policies to adequately address the Panel's findings, and apply the full meaning and scope of Jordan's Principle.

10. Following the CHRT's compensation decision (2019 CHRT 39), the then Minister of Indigenous Services Canada, the Honourable Mark Miller, attended the AFN's Special Chiefs Assembly in December of 2019. Minister Miller announced that Canada was prepared to enter into negotiations on compensation, wished to certify the Moushoom Class Action and settle litigation.

11. The AFN became concerned that it would be sidelined in discussions related to long-term reform and compensation should negotiations occur only in the context of the Moushoom Class Action. As a result on January 15, 2020, the AFN Executive Committee instructed the AFN Secretariat to initiate its own class action regarding child welfare discrimination from 1991 to the present day, and the denial or delay in receiving essential services under Jordan's Principle. Attached as **Exhibit "A"** is a copy of the Executive Motion authorizing AFN to commence its own class action. The Executive Committee is comprised of the National Chief and eleven Regional Chiefs.

Consultations with AFN Representative Plaintiffs, Stakeholders and First Nations

12. Throughout the negotiations with Canada, the AFN Executive Committee was kept informed about the negotiations process, as was the Social Development portfolio holder Manitoba Regional Chief Cindy Woodhouse, who was also present during negotiations. The AFN Executive Committee provided decisions throughout the process, including agreeing to sign the Agreement-in-Principle (AIP) and Final Settlement Agreement.

13. I have been advised by Dianne Corbiere, AFN Class Counsel, and I believe it to be true that the Representative Plaintiffs in AFN's Class Action were asked to provide input on the negotiation positions for the Final Settlement Agreement. I have also been advised that AFN external counsel met with one or more of the Representative Plaintiffs at least 30 times from January 2020 to July 2022 to provide updates on the pleadings, mediation, and negotiations of the Compensation AIP and the Final Settlement Agreement.

14. At my instruction, the AFN provided periodic reports with First Nations leadership across Canada. In particular, during the period of September 2021 to June 2022, AFN Counsel, Stuart Wuttke and Dianne Corbiere, met with First Nations leadership to provide updates of the status on the negotiations, the structure of the settlement, and the substance of what was intended to be included in the Final Settlement Agreement. I am advised by Stuart Wuttke and I believe it to be true that there were approximately 50 briefings provided to either the AFN Executive, AFN regional chiefs meetings and Chief's Assemblies. I was also at many of these briefings personally.

15. An essential element of the negotiation was that implementation of the Final Settlement Agreement would be First Nations-led. The First Nations leadership provided advice as well as insights from the lessons learned from the Indian Residential Schools Settlement and other class actions. The feedback received included the need to have a claims process that is trauma-informed, simple and accessible for the class members, and which prioritizes compensation for First Nations children. The First Nations leadership emphasized the importance of distributing compensation to individuals as soon as possible.

16. The perspectives of First Nations youth were also considered in the development of the Final Settlement Agreement. One example is that the stated purpose of the Cy-près Fund in the Final Settlement Agreement was to support class members who are not entitled to direct compensation to connect with their family, or their First Nation, or cultural/land-based activities and recreation, among other supports based on recommendations from a report written by First Nations youth with lived experience, specifically the Assembly of Seven Generations (A7G) "Children Back, Land Back" report. Attached as **Exhibit "B"** is the "Children Back, Land Back" report.

17. The AFN advocated for the insights of First Nations leadership and youth to be reflected in the Final Settlement Agreement. The AFN worked with legal counsel to ensure that the Final Settlement Agreement was structured in a manner that was culturally relevant, trauma-informed and responsive to the concerns of First Nations about the compensation process.

18. When the Final Settlement Agreement was finalized, it was provided to the AFN Executive Committee for approval, as well as the Representative Plaintiffs. Following the AFN Executive Committee's and Representative Plaintiffs' approval, the Final Settlement Agreement was presented to the Chiefs-in-Assembly and their proxies at the AFN Annual General Assembly on July 6, 2022. The AFN Representative Plaintiffs presented detailed background to the Final Settlement Agreement and how, in their view, the settlement is in the best interest of the class members.

Importance of Settlement to First Nations Communities

19. The settlement before the Court marks a historic moment for First Nations across Canada. During the numerous briefings, meetings and consultations with various First Nations stakeholders and the representative plaintiffs, the AFN was urged to pursue the best possible settlement for the children and their families who were the subject of Canada's discrimination. The AFN is proud to have achieved a monumental settlement, both in terms of its $20 billion scale and the scope of children and family members to whom it will afford compensation.

20. While no amount of compensation will bring families back together who, since 1991, have been separated, the AFN views this settlement as an important step in First Nations relationship with Canada, one which is taken together in recognition of the harms caused to our First Nations children since 1991.

21. The effects of the Canada's discriminatory practices in both FNCFS and Jordan's Principle are real and they are significant. As the CHRT found, the needs of First Nations children and families were unmet in Canada's provision of child and family services and Jordan's Principle which has caused actionable harms for which compensation must be awarded.

22. The large number of First Nations children and families impacted across Canada by the discriminatory aspects of the FNCFS Program in terms of the delivery of services continues to be a

national issue. The provision of services to First Nations children and youth, from an international perspective, amounts to a humanitarian crisis as First Nations children are disproportionately involved in the child protection system.

23. Many First Nations children and youth who are in the child welfare system were and/or are abused and betrayed on an individual level. However, given the sheer number of children, First Nations were also abused as a people.

24. The outcomes of children placed in the system are not good. Children in the child protection system are vulnerable and isolated, which increases susceptibility to sexual violence while in state care. The psychological impacts of sexualized violence on children and youth can be far-reaching, life-long and devastating. Children and youth are also more likely than the general child and youth population to suffer from depression, mental distress, suicidal ideation, self-harm and attempts at suicide.

25. Much like those common experiences faced by former students at Indian Residential Schools, First Nations children and youth are obstructed from practicing and learning their First Nation language, culture, customs, and traditions. This has an impact on collective rights of First Nations as many children in care will be unable to share or pass on to their own offspring the language, culture, customs, traditions of their community.

26. This is particularly problematic because over 94% of First Nations children are placed in state care for neglect, which is essentially for poverty related issues. In practical terms, children are often removed from loving parents and from the protection of their parents and placed into a system where they are alone and become even more marginalized.

27. The compensation this class action offers to First Nations children and families will provide a measure of access to justice and redress for them. I am aware that many First Nations persons live in remote communities and live below the poverty line. Many, if not most, are not in a position to retain counsel to initiate their own legal proceeding due to geographic, logistic and financial reasons. They simply cannot afford to litigate, and absent this class action, I believe that tens of thousands of children, youth and their families would not be able to advance their legal rights.

28. I believe that one positive outcome of the compensation package is public recognition of the harm done by the FNCFS Program and restrictive application of Jordan's Principle. The Final Settlement Agreement will lead to greater understanding in Canada of the profound harms to First Nations children and families caused by the FNCFS Program and its continued role as part of a larger policy of cultural genocide. The Final Settlement Agreement provides a fuller narrative to the big picture of Canadian history and impacts of government policy on First Nations peoples.

29. Further, the compensation package may assist in an individual's healing and reconciliation journey. Applying for compensation will require an individual to recount their personal experiences. This may involve reflecting on their memories and reassessing their personal experiences, which for some will lead to healing and reconciliation for themselves as individuals as well as for their families as a whole.

30. Finally, compensation represents an acknowledgement of the harm individuals endured. It also demonstrates the federal government's accountability for those harms. This settlement works towards allowing our communities to heal and move forward.

Jordan's Principle Approach

31. From the outset of the negotiations that have led to the proposed settlement, the AFN was adamant that the approach to compensation would be First Nations-led. This is reflected in the language of the Final Settlement Agreement.

32. The AFN was also aware that one of the most challenging aspects of the compensation methodology would be developing a method to compensate individuals who were denied essential services, experienced delay in the receipt of essential services, or experienced a service gap with respect to essential services. Hereafter, I refer to a "Jordan's Principle" approach, though the methodology applies equally to the Trout class, as is reflected in the Final Settlement Agreement.

33. Stuart Wuttke, AFN in-house legal counsel had informed me of the challenges in settling upon an approach at the Canadian Human Right Tribunal. I understand from AFN legal counsel that there was never an approach developed by the Canadian Human Rights Tribunal that could be implemented for compensation for Jordan's Principle claimants in the Final Settlement Agreement.

34. The AFN was aware of the importance of moving quickly to develop an approach to Jordan's Principle compensation because of the desire to deliver compensation to individuals as soon as possible. However, as CEO of the AFN, my instructions to class legal counsel were that moving quickly cannot lead to mistakes that would cause re-traumatization of claimants, fail to draw distinctions between claimants with various impacts, or not be responsive to the perspective of First Nations individuals.

35. The AFN also wanted to ensure that there was proportional compensation, whereby individuals who endured the most severe impacts to their quality of life would receive the most compensation, to the detriment of those less impacted. The AFN recognizes the importance of ensuring that those individuals who have endured the most impact from a deprivation of essential services will receive compensation that is proportionate to those impacts. I am informed by AFN class legal counsel that this approach is supported by the representative plaintiffs in this class action. I have instructed AFN class legal counsel to pursue this approach, which is reflected in the final settlement agreement with the "significant impact" and "other impact" categories of Jordan's Principle and Trout claimants.

36. In order to ensure a measure of proportionality while ensuring a minimization of the risk of re-traumatization, the AFN viewed it as important to develop its understanding of the measures that could approximate the impacts to First Nations children who were denied access to essential services, instead of asking individuals to tell their personal stories.

37. In June 2022, under my direction, Stephanie Wellman, Director of Social Development at the AFN, recruited a number of First Nations experts who have on-the-ground expertise in the delivery of services to First Nations individuals, as well as in measurement of health and wellness from First Nations' perspectives. While the AFN has agreed not to disclose the individual names who continue to work on this project while the development process continues, I am informed by AFN class counsel that these individuals have met as a circle of experts on several occasions since June 10, 2022, to develop a Jordan's Principle approach.

38. I have been regularly updated following these meetings by Stephanie Wellman and AFN class counsel, who have attended each of the meetings of the circle of experts and I have attended one meeting and on occasion, spoken to some of the experts on an individual basis.

39. I have instructed AFN class counsel to take into account the views of the experts and to apply First Nations knowledge to the claims process, which reflects the importance of a First Nations-led approach to compensation.

40. From the AFN meetings with the AFN Circle of Experts, and AFN class counsel there are certain key considerations for an approach to Jordan's Principle compensation of which I am aware:

(a) There is no reliable measure that currently exists that can be implemented to assess Jordan's Principle claimants' claims to compensation;

(b) Any approach that is implemented should be tested prior to implementing across a wide population to ensure its efficacy;

(c) The assessment of impacts must consider impacts that are specific to a First Nations child, which may or may nor not be equivalent to impacts that are measured in other contexts.

(d) As no child will be permitted to submit a claim until they obtain the age of majority, it is appropriate to inquire about the impact to the child at the time that the service was unavailable, and its impact on the claimant's current circumstances;

(e) An approach that is focused solely upon the nature of the essential service without considering individual circumstances is unlikely to achieve proportional compensation.

41. The proposed approach cannot be finalized or implemented prior to testing. However, the work of the AFN Circle of Experts and AFN class counsel that has been accomplished to date is summarized in the Framework Approach to Jordan's Principle, which is currently posted on the AFN's website, and is attached hereto and marked as **Exhibit "C"** to my affidavit.

42. The core components of the approach to Jordan's Principle compensation that the AFN supports are:

(a) A simplified claims form that will ask minimal information from the claimant but will identify the service that an individual did not receive as a child.

(b) A professional confirmation form, which will identify the essential service from which the claimant would have benefitted as a child. This permits claimants to prove the need for an essential service without requiring historical documentation. A draft professional confirmation form is attached hereto and marked as **Exhibit "D"** to my affidavit.

(c) An impact assessment tool, which will inquire as to the claimant's circumstances in relation to the deprivation of services. A draft impact assessment questionnaire is attached hereto and marked as **Exhibit "E"** to my affidavit.

43. I have instructed the AFN to strike a group of appropriate individuals to oversee and implement testing with a pilot group of potential Jordan's Principle claimants. The piloting is to be implemented in a manner to be determined by the responsible oversight committee and will include the best testing methodologies that are employable in the time available to ensure that the documents achieve the best possible claims process for the class.

44. There must be flexibility in the approach to permit the final claims-related documents to reflect the learnings from the pilot and to the evolving understanding of the approach. The documents which are currently in place are promising and are headed in a direction that are consistent with my instructions, but will need to be evaluated and adjusted in accordance with the results of the piloting process. I am informed by AFN class counsel that the testing is to occur based upon the versions of the documents that are attached to this my affidavit, and that this testing is expected to commence as soon as possible.

45. I am pleased with the progress thus far on Jordan's Principle. I am supportive of the approach that is represented in the exhibits to my affidavit. I thank the individuals who have contributed to the First Nations-led approach to Jordan's Principle compensation.

ACKNOWLEDGING that this affidavit was affirmed remotely in accordance with the *Commissioners for Taking Affidavits Act* – Ontario Regulation 431/20 Administering Oath or Declaration Remotely, with the commissioner located in Ottawa and the deponent located in Ottawa.

AFFIRMED BEFORE ME in the city of Ottawa, in the Province of Ontario, this 6 day of September, 2022)

Observers:
Arturo Calvo
Chief Leroy Denny

Motion #2:

The Executive Committee directs the AFN Secretariat to file a class action claim in the Federal Court of Canada regarding child welfare discrimination from 1991 to the present day, and the denial or delay in receiving essential services under Jordan's Principle. The AFN shall uphold the integrity of the compensation order issued by the Canadian Human Rights Tribunal in the class action process and incorporate those individuals from 1991 to 2006 into the base amount of $40,000 for compensation. The Executive Committee directs the class action not focus solely on compensation, but broader reforms to the federal government's First Nation Child and Family Services program and Jordan's Principle.

Prior to filing the class action, the AFN shall advise the Moushoom group regarding the filing of AFN's class action as a courtesy. The AFN shall also seek the written assurance from the federal government that the AFN class action will be certified.

Moved by: Regional Chief Kevin Hart, MB
Seconded by: Regional Chief Norman Yakeleya, NT
Motion carried.

ASSEMBLY OF SEVEN GENERATIONS

CHILDREN BACK, LAND BACK:
A Follow-Up Report of First Nations Youth In Care Advisors

Gabrielle Fayant and Ashley Dawn Bach

December 2021

WE WANT TO GIVE THE BIGGEST THANK YOU to all survivors who took time out of their days to share with us their stories and guidance in our survey and/or focus groups. It is not easy to share these stories and many survivors have not been able to share their stories yet. We hope that this report and the work of survivors and allies of children and youth in/from care will bring us closer to a day where child welfare is no longer a reminder of trauma or violence. Your commitment to see accountability and justice will not be in vain.

We also want to give a big thank you to Cindy Blackstock and the Caring Society for their years of advocacy and determination to see justice for all Indigenous children and youth. A special thank you to Brittany Mathews who worked tirelessly on many reports throughout the years so that children and youth voices could be honoured. As well, we greatly appreciate Youth in Care Canada for promoting our focus groups and survey.

We want to thank the youth from A7G who supported the development of this report through note-taking and facilitation. Thank you Harmony Eshkawkogan, Jordyn Hendricks, Cedar Iahtail and Stephanie Regimbal. And a special thank you to Kakeka Thundersky for facilitating both focus groups and offering guidance from her lived experience to ensure the focus groups were done in a good way.

Thank you to knowledge keepers Elaine Kicknosway and Harry Snowboy who supported us through the process through ceremony, kindness and encouragement.

From Ashley Dawn Bach and Gabrielle Fayant

TRIGGER WARNING – Violence, Death, Suicide, Genocide, MMIWG2S+, Residential Schools, Child Welfare, Abuse, Racism

Before beginning to read this report, we want to warn readers that the information may be difficult and challenging to read and accept, especially for Indigenous folks who have been directly impacted by Child Welfare, Residential Schools and/or the Crisis of Missing and Murdered Indigenous Women, Girls and Two-Spirit People.

This report is not necessarily a read for Indigenous peoples, as we know first-hand that our experiences with colonization and Canada have been violent and devastating. We want to acknowledge that once again we have to create reports in order to prove to Canada that the mistreatment and violence that Indigenous peoples have experienced is real and can no longer be ignored.

Glossary

Accountability: the fact or condition of being accountable; responsibility.

CHRT Decision: The Canadian Human Rights Tribunal (CHRT) has a statutory mandate to apply the *Canadian Human Rights Act*[1] (CHRA) based on the evidence presented and on the case law.

Created by Parliament in 1977, the Tribunal legally decides whether a person or organization has engaged in a discriminatory practice under the *Act*. The purpose of the CHRA is to protect individuals from discrimination. It states that all Canadians have the right to equality, equal opportunity, fair treatment, and an environment free of discrimination.

The CHRT applies these principles to cases that are referred to it by the Canadian Human Rights Commission (CHRC). The Tribunal is similar to a court of law but is less formal and only hears cases relating to discrimination.[2]

A CHRT decision is made by the Tribunal after a case which determines whether or not a person or organization is engaging in discriminatory practice. The CHRT has since issued 21 non-compliance and procedural orders since the landmark ruling in 2016.

Compensation: something, typically money, awarded to someone as a recompense for loss, injury, or suffering.

Discrimination: the unjust or prejudicial treatment of different categories of people or things, especially on the grounds of race, age, or sex.

Disparity Index: An index of the disparities between First Nations children and youth in care an non-First Nations. The index shows the great difference between the two groups and other groups.

First Nation Child and Family Services: According to Indigenous Services Canada (ISC), "ISC provides funding to First Nations child and family services agencies, which are established, managed and controlled by First Nations and delegated by provincial authorities to provide prevention and protection services. In areas where these agencies do not exist, ISC funds services provided by the provinces and Yukon but does not deliver child and family services. These services are provided in accordance with the legislation and standards of the province or territory of residence. As of January 1, 2020, service providers delivering child and family services to Indigenous children must comply with the

1 https://laws-lois.justice.gc.ca/eng/acts/h-6/FullText.html
2 https://www.chrt-tcdp.gc.ca/index-en.html

national principles and minimum standards set in *An Act respecting First Nations, Inuit and Métis children, youth and families*."[3]

In other words, a federally funded program where First Nations agencies receive funding from the Canadian government for service delivery to on reserve children and families. First Nations agencies must follow provincial/territorial child welfare laws.[4]

Jargon: special words or expressions that are used by a particular profession or group and are difficult for others to understand.

Jurisdictional Disputes: Jurisdiction is the legal term for the authority granted to a legal entity to enact justice. In the case of Jordan River Anderson, the province of Manitoba and Canada disputed over who was legally and authoritatively responsible to pay for his medical care.

Metis Settlements: Metis Settlements are land-based Metis communities in Alberta that extend across 1.25 million acres and make up eight communities (Buffalo Lake, East Prairie, Elizabeth, Fishing Lake, Gift Lake, Kikino, Paddle Prairie and Peavine). These eight settlements form a constitutionally protected Métis land base in Canada that are self-governed by the Metis Settlements General Council (MSGC). Learn more at msgc.ca.

Background

This report is coming at a very important time in Canadian history and for the justice of First Nations youth that have experienced child welfare. This report is a follow-up to the *Justice, Equity and Culture: The First-Ever YICC Gathering of First Nations Youth Advisors* report. This report will clearly state solutions and recommendations from First Nations children and youth themselves because who else would know the problems and solutions better than those that have experienced child welfare first-hand.

The first gathering of First Nations Youth in Care Advisors produced several recommendations, including developing a collective of advisors. Further gatherings, continuing communication between Indigenous youth advisors and sharing opportunities is essential to support the development of a collective of First Nations Youth in Care Advisors. Furthermore, the ongoing discussions and negotiations around the Canadian Human Rights Tribunal (CHRT) orders among the Assembly of First Nations (AFN), the First Nations Child & Family Caring Society (Caring Society), Chiefs of Ontario, Nishnawbe Aski Nation, and the federal government make this second gathering of First Nations Youth in Care Advisors even more relevant and timely. It is imperative voices of First Nations youth in/from care are amplified and brought to these discussions and negotiations which will intimately affect their lives.

The full list of recommendations from the *Justice, Equity and Culture: The First-Ever YICC Gathering of First Nations Youth Advisors* report is listed below.

Recommendations for Compensation and Future Settlements

Most of the Youth Advisors said that they did not want to form an uneducated or rushed position on the 2019 CHRT 39 compensation, noting that Canada and the Crown have rushed or imposed major decisions on Indigenous Peoples throughout colonial history. Examples include treaty-making, the scrip system, the *Indian Act*, etc. Instead, Indigenous ways of decision making, consensus-building and holistic approaches should be applied this time.

The Youth Advisors want more time to learn about the 2019 CHRT 39 decision. They have much lived experience from being in care but little experience or knowledge of individual compensation settlements and how trusts or foundations could be utilized. Their lived experiences led the Youth Advisors to make the following recommendations:

1. There must be safety around compensation.
    a. Healing circles, sweat lodge ceremonies, support for counselling or therapy, etc.

2. There must be mental health supports and navigational assistance to help youth apply for compensation.
    a. Talking to lawyers and government employees can be very triggering for First Nations youth; therefore, having support to apply and fill out forms is essential.
    b. Getting access to files and birth certificates, for example, can be very challenging and trigger stressful emotions.
    c. Along with navigational support, youth also need mental health supports to help with their experiences and challenges.
3. There must be continued support after compensation.
    a. For example, at least one year of counselling or therapy must be covered. Indigenous Services Canada's Non-Insured Health Benefits coverage is limited and some First Nation youth do not have government-recognized status or access to their status cards.
4. There must be restitution for children and youth who have died while in care or due to their experiences in the child welfare system.
    a. Compensation should to go to parents, grandparents or a trust fund.
5. Financial training for youth receiving compensation should be offered.
    a. Youth Advisors said this shouldn't be mandatory but rather an option for individuals receiving compensation.
    b. Recipients should be offered awareness training about predatory banks and financial institutions, like those that swindled compensation from residential school survivors.

Next Steps

This was the first national level gathering of its kind for First Nations youth in and from care. The Youth Advisors said they want to continue to have the time and space they need to discuss important and pressing issues, including the following.

1. Become a collective of First Nation Youth Advisors in and from care
    a. share best practices
    b. share updates
    c. continue advocating for reform
    d. host more policy round tables across the country
    e. advise on court rulings, contribute to policy development, share testimonies, etc.
2. Continue to meet about compensation and settlements
    a. learn more about options such as trusts, individual pay-outs, hybrid approaches, etc.
    b. keep learning about trust funds, scholarships, pooling compensation, etc.
    c. learn about best practices regarding settlements from other Indigenous communities

The entire report can be found at https://www.a7g.ca/uploads/9/9/9/1/99918202/38228_chrt_compensation_report_v5_final.pdf.

Doing a follow-up gathering with First Nations youth in/from care was also important because of the grave disparities in overrepresentation of First Nations youth in the child welfare system. Overall, ISC reported from 2016 Canadian census data that 52.2 percent of children in foster care under the age of 14 are Indigenous.[5] As shown in Table 1 by Sinha et al. (2011), in most Canadian provinces Indigenous (Aboriginal) children are substantially over represented in the child welfare system compared to non-Indigenous (non-Aboriginal) children. Manitoba has the greatest disparity, with Indigenous (Aboriginal) children experiencing placements at 19 times the rate of non-Indigenous (non-Aboriginal) children.

TABLE 1: Disparity in representation of Aboriginal non-Aboriginal children in care for Canadian provinces*,**

	% of Children in Care		% of Total Child Population[h]		Disparity in Representation of Aboriginal and Non-Aboriginal Children in Care
Provision of Ongoing Services	Aboriginal Children	Non-Aboriginal Children	Aboriginal Children	Non-Aboriginal Children	
British Columbia[a]	52%	48%	8%	92%	12.5
Alberta[b]	59%	41%	9%	91%	14.6
Saskatchewan[c]	80%	20%	25%	75%	12.0
Manitoba[d]	85%	15%	23%	77%	19.0
Ontario[e]	21%	79%	3%	97%	8.6
Quebec[f]	10%	90%	2%	98%	5.4
Nova Scotia[g]	16%	84%	6%	94%	3.0

* Data for New Brunswick and for Canadian territories were not publicly available.

** Data in this table reflect definitions and data collection protocols which differ by province. (For example, data from some provinces may include children in the care of relatives.) The data demonstrate overrepresentation of First Nations children within jurisdictions, but data for different provinces are not directly comparable.

Source: Sinha et al. (2011). *Kiskisik Awasisak: Remember the Children. Understanding the Overrepresentation of First Nations Children in the Child Welfare System.* Ontario: Assembly of First Nations. https://cwrp.ca/publications/kiskisik-awasisak-remember-children-understanding-overrepresentation-first-nations

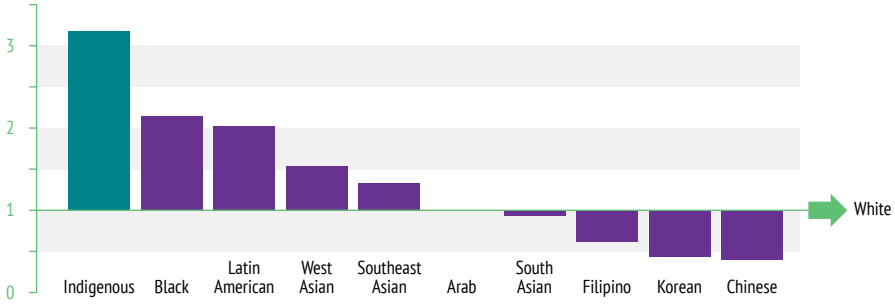
Youth and children in and from care deserve to have a voice and deserve to be heard. The CHRT found that the federal funding formulas for the First Nations Child and Family Services Program incentivized the removal of First Nations children from their families and communities "as a first resort rather than as a last resort."[6] It was in this landmark ruling that the CHRT found that Canada is discriminating against First Nations children and young people due to its inequitable child welfare funding and failure to properly implement Jordan's Principle.

5 https://www.sac-isc.gc.ca/eng/1541187352297/1541187392851

6 2016 CHRT 2, para. 344. https://fncaringsociety.com/publications/2016-chrt-2-2016-tcdp-2

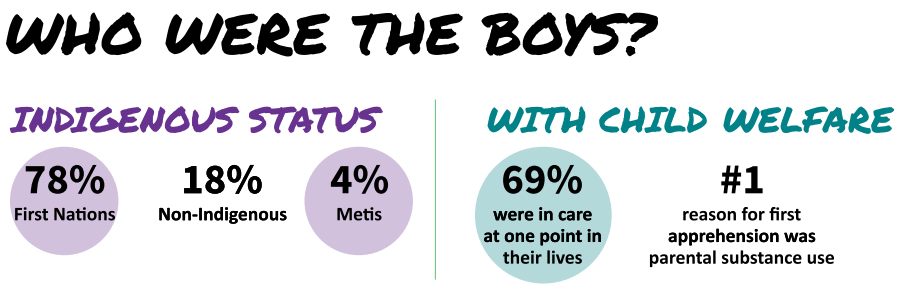
The following graph illustrates the disparity of Indigenous children in child welfare in Canada.

FIGURE 1. **CIS 2019 Findings – Disparity Index by Ethno-racial Category for Investigated Children (0–15 years) in Canada in 2019**



Source: Fallon et al. (2021). *Denouncing the continued overrepresentation of First Nations children in Canadian child welfare: Findings from the First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect-2019.* [PowerPoint slides].

This longstanding discrimination and failure to redress the legacy of the residential school system has led to an overrepresentation of First Nations youth being placed into the child welfare system. These young people are also experiencing severe mistreatment and abuse even leading to death. In Manitoba, a special report was conducted by the Manitoba Advocate for Children and Youth to investigate the deaths and suicides of 45 boys. The investigation found that 82 percent of the boys were either First Nations or Metis and 69 percent of the boys were in care at one point in their lives. This data does not include information about deaths and suicides Canada-wide and it does not show the experience of girls or gender-diverse children but it demonstrates the fact that Indigenous children and youth in care are in dire need of systemic changes and long-term efforts to support their well-being.



Adapted from: Manitoba Advocate for Children and Youth. (2021). *Finding the Way Back: An aggregate investigation of 45 boys who died by suicide or homicide in Manitoba.* Winnipeg, MB. https://manitobaadvocate.ca/wp-content/uploads/MACY-Special-Report-Finding-the-Way-Back.pdf

It is not understated to say that amplifying First Nations youth voices in and from care and committing to the changes they need is a matter of life and death.

Overview of Child Welfare

Canada's child welfare system is multifaceted and takes different approaches based on First Nations status, residency on-reserve, and residency in each province and territory. Each province and territory has their own Child and Family Services Act. In 2019, *An Act respecting First Nations, Inuit and Métis children, youth and families* was passed at the federal level, which affirms First Nation, Inuit, and Metis rights to care for their children and sets out principles for Indigenous child and family services provision. Implementation of the Act began in 2020.[7]

Most survey respondents and focus group attendees were from Ontario and British Columbia so a short overview of each of these systems is presented here. The Institute for Fiscal and Social Democracy (IFSD) has described child welfare systems for children living off-reserve, with the exception of Ontario, Manitoba, and Quebec, as "decentralized, with responsibility falling under provincial and territorial jurisdictions" (2018).[8] In Ontario, child welfare services are delivered by Children's Aid Societies (CASes) which are provincially licensed and receive transfer payments from the Ontario government. There are also Indigenous child and family well-being agencies in Ontario. In British Columbia, the Ministry for Children and Family Development (MCFD) provides child welfare services and recognizes "Aboriginal child welfare agencies" across the province, many of which fall under the First Nations Child and Family Services (FNCFS) program.

For First Nations children on-reserve and in the Yukon, Indigenous Services Canada (ISC) provides funding for FNCFS. However, ISC does not actually deliver these services. Instead, these services are delegated by provincial authorities and delivered by FNCFS agencies. If there are no FNCFS agencies in a region, ISC will provide funding to the province and/or the Yukon for them to provide those services.

Overview of Jordan's Principle

In 1999, Jordan River Anderson was born in Winnipeg, Manitoba. He was originally from Norway House Cree Nation, a northern First Nation that does not have access to comprehensive medical supports and services. Jordan was born with complex medical needs so continued to live in the hospital. At the age of two, Jordan's doctors said he could live in a specialized medical foster home in Winnipeg. Unfortunately, the province of Manitoba and the federal government (Canada) argued over who would pay for his home care. He passed away at the age of five while still living in the hospital. Jordan's Principle was established in 2007 in response to this tragedy. Jordan's Principle is a child-first principle to ensure First Nations children get the services they need when they need them. Functionally, this means that the government which is first contacted will cover the costs of services and Canada, the Provinces, and Territories can sort out their "jurisdictional disputes" later.

What is Happening Now

The Caring Society and AFN filed a complaint against Canada for discriminating against First Nations children living on reserve and in the Yukon with the Canadian Human Rights Tribunal (CHRT) in 2007. In 2016, the CHRT found that First Nations children and families on reserve and in the Yukon are being unnecessarily removed from their homes, families, and communities because of this discrimination. Further, the CHRT found that Canada is discriminating against First Nations children by not implementing Jordan's Principle. The CHRT has since issued 21 non-compliance and procedural orders since the landmark ruling in 2016.

In September of 2019, the CHRT ruled that First Nations children and their parents or grandparents should receive compensation of $40,000 for the discrimination they experienced from Canada with regards to First Nations child and family services and Jordan's

"Doing everything could result in economic payback. Investments in wellness, prevention and least disruptive measures (LDM) would pay for themselves within 28 years. This economic payback is in child welfare terms only and does not account for the significant benefits that would result from having healthy children grow into healthy and independent adults who would be less likely to access the services of justice, health, drug and alcohol, mental health and unemployment Insurance."

—Wen:De: The Journey Continues[9]

9 https://fncaringsociety.com/publications/wende-journey-continues-wen-de-nous-poursuivons-notre-route

Principle. Just after that compensation ruling, the very first Gathering of First Nations Youth in Care Advisors took place. Canada then filed a judicial review (like an appeal) of this compensation ruling to the Federal Court. That appeal was set aside by the Federal Court on September 29, 2021. On October 29, 2021, the Federal government again filed a judicial review of the Federal Court's decision to set aside their appeal.

After filing the judicial review, Canada requested, and the Parties agreed, to pause legal proceedings for a very short time to allow for focused and intense negotiations to try and reach an agreement to end the Federal government's discrimination and prevent its recurrence in the provision of child and family services and Jordan's Principle, including compensation. Feedback from the youth advisors has been synthesized into recommendations that will be shared with the government and all parties who are negotiating.

Methodology

The following report and findings were collected using several methods including focus groups, surveys and literature review of existing reports on child welfare.

Two focus groups were held during the month of November 2021. First Nations Youth Advisors from the first YICC Gathering of First Nations Youth Advisors were invited to participate in focus groups. Youth were also invited to respond to a public call for participants. A national survey was sent out among multiple social media platforms. Over the course of three weeks, the focus groups and survey heard from over 100 respondents.

Information for this report was also collected by honouring the multiple existing reports and findings from First Nation youth in and from care and their advocates. These reports include:

- *Justice, Equity and Culture: The First-Ever YICC Gathering of First Nations Youth Advisors* (YICC, 2019);
- *Accountability in Our Lifetime: A Call to Honour the Rights of Indigenous Children and Youth* (A7G, 2021);
- *Indigenous Youth Voices Report: A Way Forward in Conducting Research With and By Indigenous Youth* (Indigenous Youth Voices, 2019);
- *A Roadmap to the Truth and Reconciliation Commission Call to Action #66* (Indigenous Youth Voices, 2018);
- *Finding the Way Back: An aggregate investigation of 45 boys who died by suicide or homicide in Manitoba* (Manitoba Advocate for Children and Youth, 2021);
- *Denouncing the Continued Overrepresentation of First Nations Children in Canadian Child Welfare* (First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect, 2019);
- *The National Household Survey* (NHS-2011);
- *Wen: De: The Journey Continues* (First Nations Child & Family Caring Society of Canada, 2005);
- *An Act respecting First Nations, Inuit and Métis children, youth and families* (Canada, 2019).

Ethical Research Engagement with Indigenous Youth: Seven Requirements

From the Indigenous Youth Voices Report, *A Way Forward in Conducting Research With and By Indigenous Youth*

Indigenous Youth Voices Research Team: Gabrielle Fayant, Michif; Brittany Mathews, Michif; Carrington Christmas, Mi'kmaw; Erin Donnelly, Haida; Andrea Auger, Ojibwe

In partnership with the First Nations Child & Family Caring Society, Indigenous Youth Voices conducted community-based research and released a report on the topic of conducting research with and for Indigenous youth. The final report, *A Way Forward in Conducting Research With and By Indigenous Youth*, offers a path towards rethinking and reshaping research that is meaningful, respectful and inclusive of Indigenous youth. This factsheet summarizes seven requirements for conducting ethical research with Indigenous youth.

"When done in a respectful and meaningful way, research has the potential to uplift Indigenous youth and can be used for the betterment of communities."

1. Accessibility

CONTENT: Research must be accessible, from the initial stages of the project to the dissemination of results. Research needs to be developed and delivered in language that is accessible for Indigenous youth. This includes Indigenous languages and language that is not simply written in academic terms.

SUGGESTIONS
→ Create a plain language glossary of terms
→ Work with youth to create relevant messaging and content using mediums that resonate with them

PARTICIPATION: Researchers have a responsibility to work with Indigenous youth to identify and overcome barriers that prevent meaningful youth participation. Some of these barriers include transportation, child care, and fair compensation for the time and energy Indigenous youth spend.

SUGGESTION
→ Ensure that research proposals include a youth participation budget for food, transportation, honoraria/pay etc.

This factsheet was created in partnership with IYV as part of Yellowhead Institute's 2020 Call for Collaboration

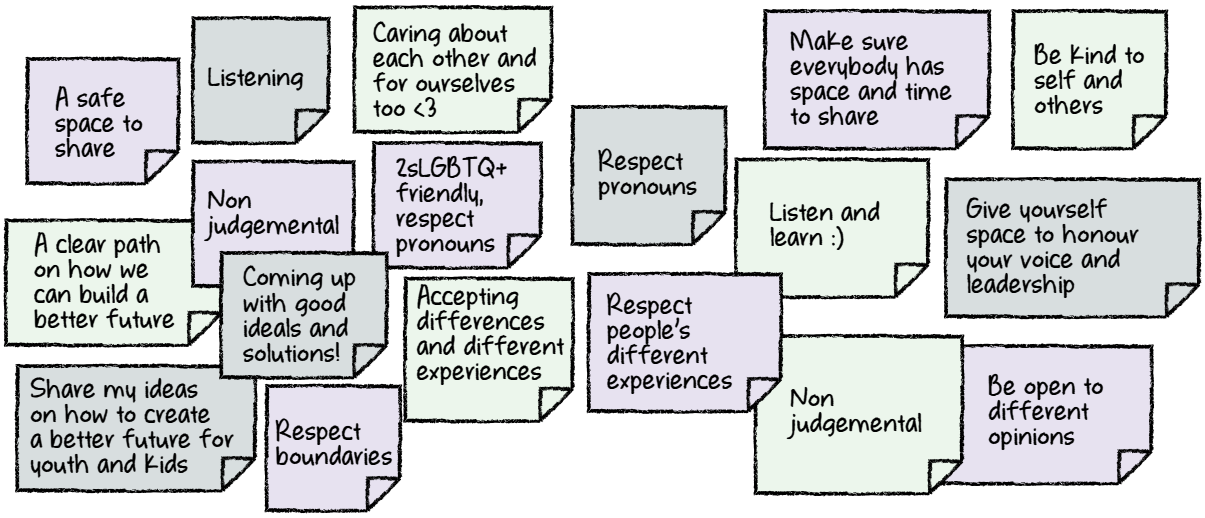
www.yellowheadinstitute.org | @Yellowhead_

Yellowhead Institute

This report and research followed A7G's Ethical Research Engagement Requirements.[10]

10 https://yellowheadinstitute.org/resources/ethical-research-engagement-with-indigenous-youth-seven-requirements

Youth who participated in the focus groups also led the discussions and expectations of the research, further ensuring that data was collected for this report in an ethical way. Some of the group accountability and ethics for this report are identified as the following:



Source: Participant survey.

The survey questions were developed and reviewed by Indigenous youth. Throughout the survey, background information and definitions of words such as "discrimination," "ethical," and "Jordan's Principle" were provided.

The survey began by asking demographic questions in the "Tell Us About Yourself" section, for example whether the respondent identified as First Nations, Inuit, or Metis, if they were from a remote or fly-in community, and the province or territory they were in care in. The survey then moved into the "Ending Discrimination" section, which provided a number of mostly open-ended questions asking if youth had experienced impacts of discriminatory underfunding, what was needed to end and prevent such discrimination, and what youth personally wanted or needed to address the impacts of discriminatory underfunding.

Finally, a section on the "Experiences and Needs of Youth in/from Care" asked youth how they felt about cultural safety while in care, developing or maintaining community connections while in care, and experiences transitioning from care into adulthood. Some of the questions in this section, for example about the role of a potential foundation and mechanisms for accountability, were also intended as follow up to the previous Gathering of First Nations Youth in Care Advisors. At the end of the survey, respondents were given the option to leave their contact information to receive a small honorarium.

Limitations

While this research is a step in the right direction, there was not enough time or capacity to fully hear from youth in and from care that may be experiencing homelessness, vicarious living conditions, lack of access to Wi-Fi or internet or living in remote or rural communities. Folks that needed accessibility accommodations and/or language interpretation were also not able to participate in this research as much as we would have liked.

Youth that we spoke with also reminded us that they have to be a part of the decision making and for many, that means having information written and worded in a way that is accessible. This looks like limiting legal jargon from conversation with folks who have no legal background, avoiding acronyms and using closed captioning to name a few.

Lastly, COVID-19 continues to create a huge limitation by creating barriers from cultural ceremonies and safety to be honoured while having these conversations as well as the limitation of not being able to form closer bonds and relationships during our time together.

"Jargon is not revolutionary."

"I cant comment on this because I have no idea even how to"

—Participants

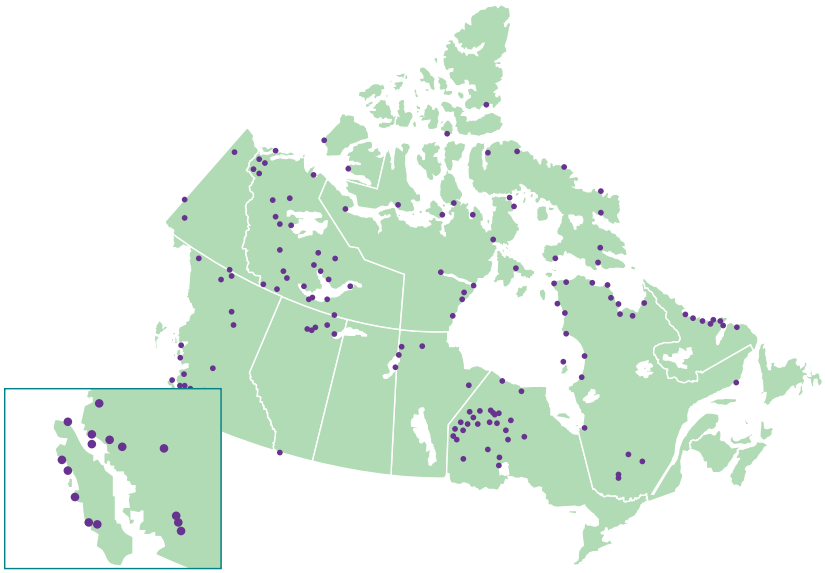
Who We Heard From

While this report was created with the mandate to hear from First Nations youth and children in and from care, we also left some room for Metis and Inuit to share their stories because we see Child Welfare Reform as an opportunity to improve the lives of all Indigenous youth. Of the survey respondents, 88 percent identified as First Nations and the majority of those stated they had First Nations status. Another 13 percent of respondents identified as Metis or Inuit. Two percent identified as non-Indigenous and were disqualified from the remaining questions. It is important to note that this total is greater than 100 percent because many Indigenous youth identify as First Nations/Metis or First Nations/Inuit. Forcing Indigenous peoples to fall into only one part of Section 35 of the Canadian Constitution can further isolate an Indigenous youth or child.

> "According to Census 2016, Indigenous children represent 52.2% of children in foster care in private homes in Canada, despite accounting for only 7.7% of the overall population of children under 15.
>
> *—Bill C-92: An Act respecting First Nations, Inuit and Métis children, youth and families receives Royal Assent – News Release*[11]

Of the survey respondents, 86 percent were under the age of 30 (0–29 years old) and 14 percent were over 30 years old. While it is important to hear from children and youth currently living in and from care it is also important to acknowledge the long term impacts of child welfare. Further, youth in their 20s may still be interacting with the child welfare system, though not necessarily in a foster home or group home, depending on their province or territory as well as the children's aid society they were under the care of.

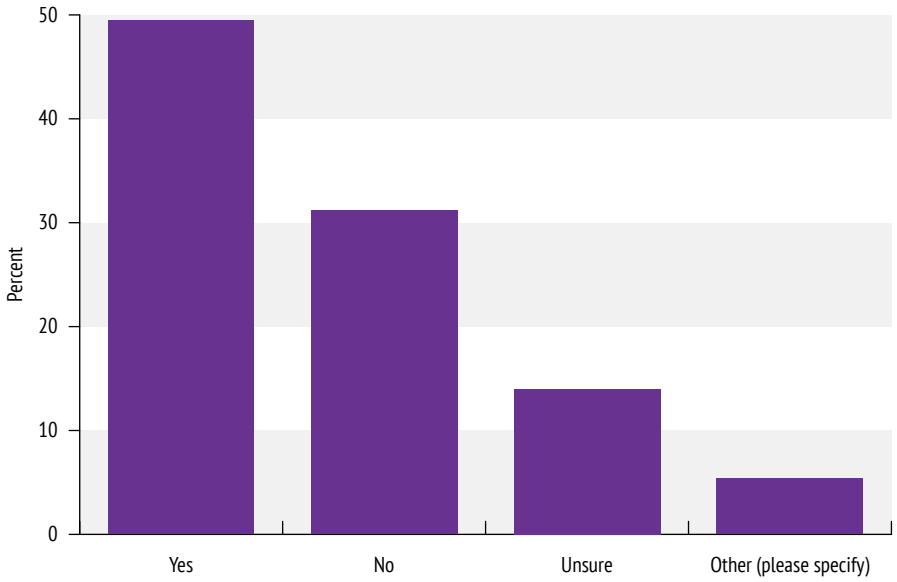
FIGURE 2. Map showing remote and fly-in communities across Canada



Source: https://www.researchgate.net/figure/Remote-aboriginal-communities-in-Canada-a-Weis-Maissan-2007-power-generation_fig5_252326166

11 https://www.canada.ca/en/indigenous-services-canada/news/2019/06/an-act-respecting-first-nations-inuit-and-metis-children-youth-and-families-receives-royal-assent.html

FIGURE 3. **Is your community fly-in or do you consider it remote?**



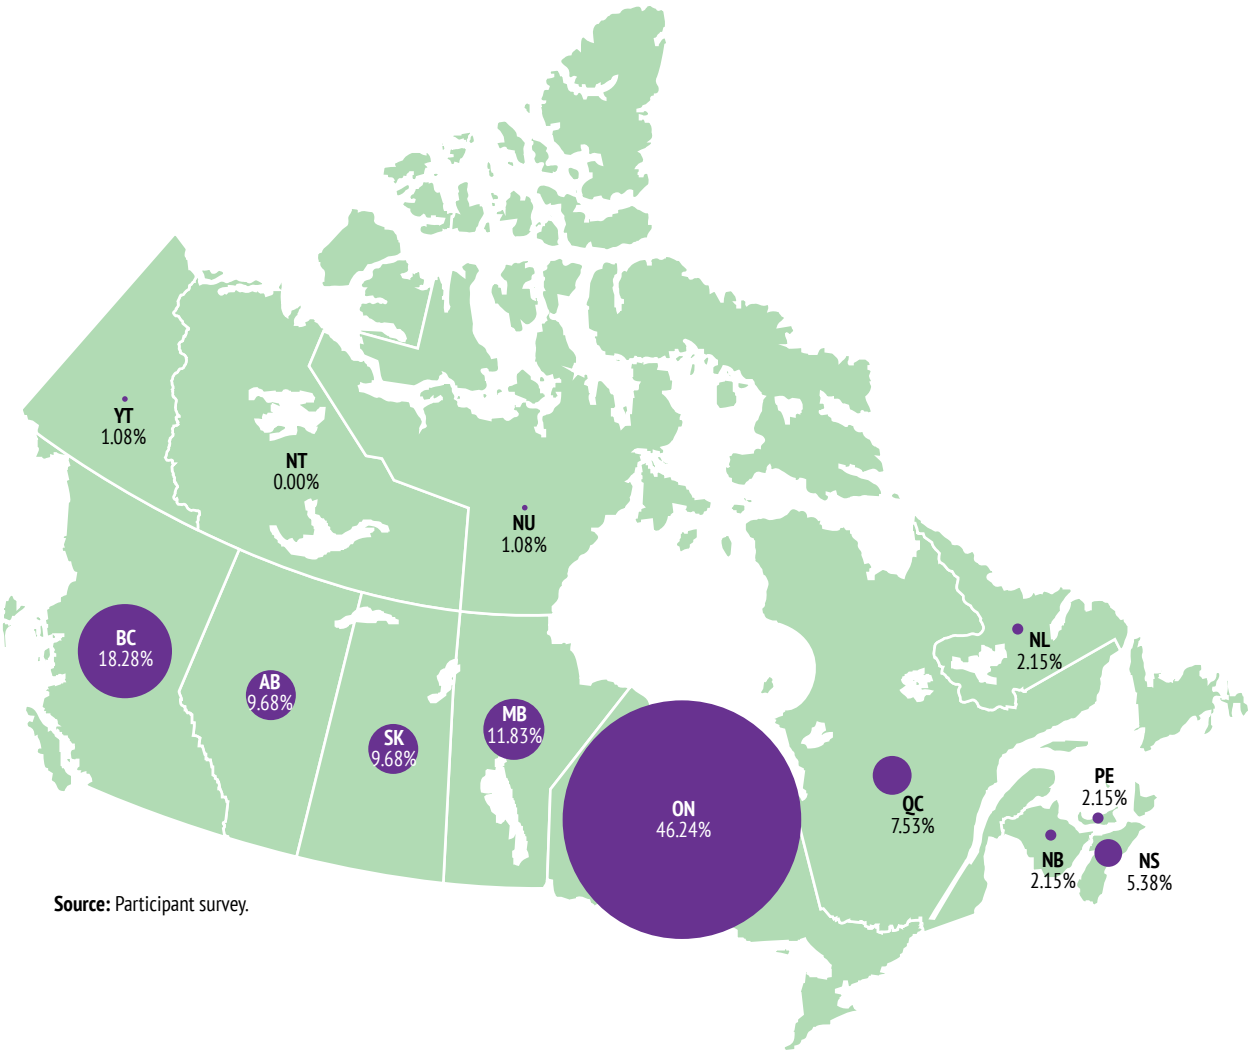
Source: Participant survey.

Though a definition of remoteness is not universally agreed upon, a First Nation that is not accessible by all-season roads is often considered to be remote or fly-in. Communities that are remote or fly-in tend to face unique challenges and needs on top of the existing inequalities and inequities most First Nations face. Figure 2 identifies 160 remote communities across Canada which were considered to be under the mandate of the former Indian and Northern Affairs Canada (INAC) department in 2005. These include First Nations reserves and communities as well as Inuit communities and certain other Northern communities. Half of respondents (50 percent) considered their community to be a fly-in or remote community. Thirty-one percent said their communities were not remote or fly-in and another 14 percent were unsure. Six percent responded to the "other" category and their answers included being from a rural community or that they have lived in the city but never on-reserve.

The survey received responses from across the country. Forty-six percent of respondents were from Ontario, which indicates Ontario is over-represented in the survey. This over-representation may come from the authors' location and community connections in Ontario. On the other hand, only 12 percent of respondents were from Manitoba despite the largest number of First Nations foster children living in that province. Another 18 percent of respondents were from British Columbia, 9.68 percent from Alberta, and 10 percent from Saskatchewan. Only 8 percent of respondents were from Quebec, which may reflect the survey being only available in English. Respondents from Nova Scotia were represented the most out of the Maritimes at 6 percent while New Brunswick, Prince Edward Island (PEI), and Newfoundland and Labrador each

represented 2 percent of the respondents. Lastly, 1 percent of respondents were from the Yukon and Nunavut each.

FIGURE 4. What Province or Territory were you in care in?



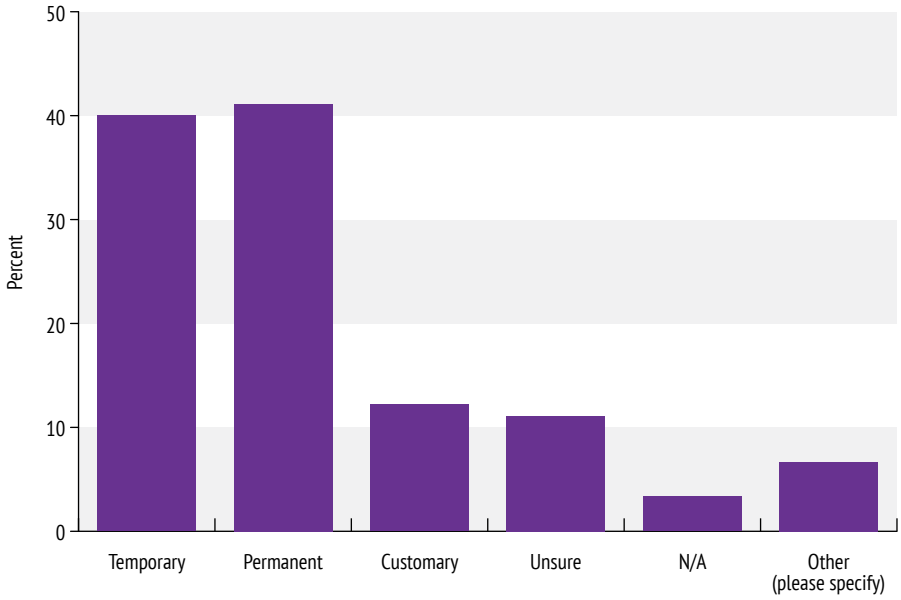
Source: Participant survey.

Location of residence has implications for children who are apprehended into the child welfare system. Indigenous Services Canada's (ISC) First Nations Child and Family Services (FNCFS) program applies to First Nations children and youth whose parents or guardians are ordinarily resident on-reserve or in the Yukon. Further, each province and territory has their own child and family services act which may impact Indigenous child and family services provision, including delegation of First Nation or Aboriginal agencies or children's aid societies (CAS). Forty-two percent of respondents indicated being born or raised on a First Nations reserve and 9 percent in the Yukon.

Fourteen percent of respondents said they were raised on a Metis Settlement, an amount that is higher than the percent of respondents who indicated they were Metis. This may be because respondents who grew up on a Metis Settlement identified as First Nations and/or First Nations and Metis or respondents were confused about what a Metis Settlement was.

Thirty percent of respondents said they weren't raised on reserve, in the Yukon, or on a Metis Settlement and 3 percent were unsure. Another 3 percent selected "other" and elaborated that they live in the city.

FIGURE 5. What type of care agreement were you or are you under?



Source: Participant survey.

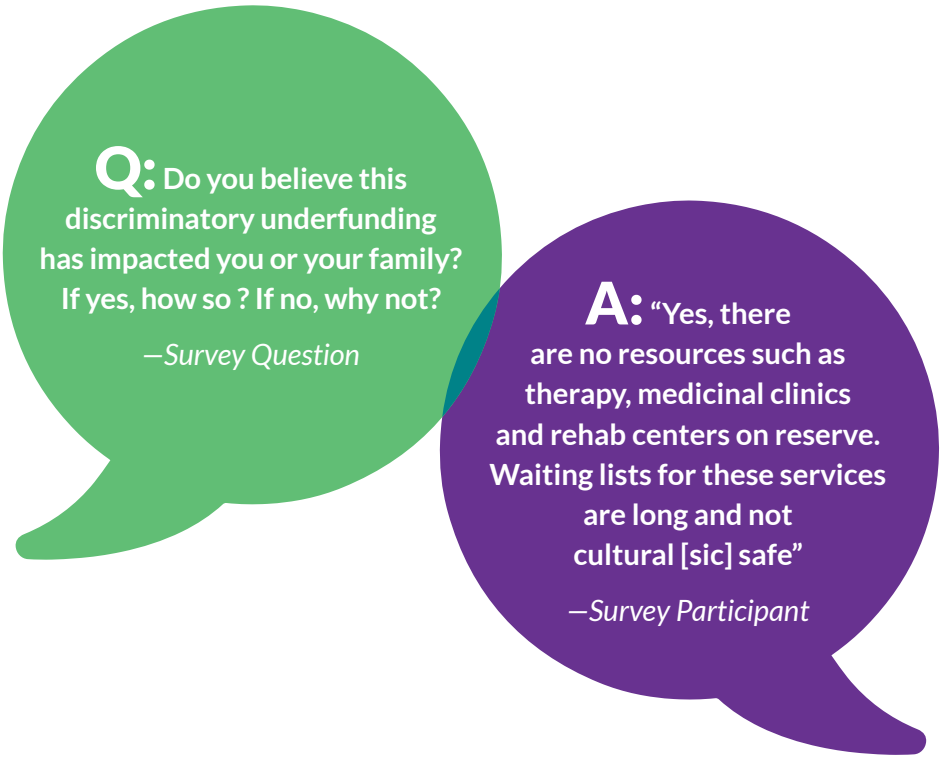
Youth can experience multiple types of care agreements. For example, many youth are placed in temporary care when they are apprehended before moving to a permanent care agreement.

The most common types of care agreements experienced by respondents were temporary, with 40 percent of respondents experiencing this, and permanent, with 41 percent of respondents experiencing this. Twelve percent of respondents indicated being in customary care. Customary care means the care of an Indigenous according to the customs and traditions of their community, by someone other than their parents. Further, 11 percent of respondents were unsure what sort of care agreements they were/are under, 7 percent listed another sort of care agreement, including being a crown ward and being adopted, and 3 percent responded this was not applicable to them.

What We Heard

Indigenous youth in and from care that participated in the focus groups and survey told us about major concerns they experienced stemming from their experiences in child welfare. The main themes can be categorized in the following: Systemic Discrimination and Racism, Proper and Ethical Implementation of Solutions and First Nations Youth In and From Care are the Experts.

Systemic Discrimination and Racism



When speaking to respondents in the survey and in focus groups, there was an overwhelming number of participants that spoke to the need for proper services for Indigenous youth and children. The systemic racism that has constantly underfunded First Nations youth and children within child welfare contributes to the high rates of incarceration, mental health concerns and high rates of death in First Nations families and communities. If funded equitably from the beginning, many traumas could be prevented and avoided.

The cost of doing nothing: "the choice is to either invest now and save later or save now and pay up to six to seven times more later."[12]

—Wen:de: The Journey Continues

From the survey, 70 percent of respondents said that believed that discriminatory underfunding impacted them or their family, 17 percent were unsure or could not answer and 10 percent said the non-Indigenous families they were placed into had enough resources but some of these respondents also mentioned not knowing anything about their Indigenous identity while living in these homes.

In addition, respondents from the survey and participants in the focus groups also shared how underfunding impacted their childhood and adolescence as well as long-term impacts. These impacts included the following but are not limited to:

- Removal from birth, biological or blood family
- Lack of support for birth, biological or blood family – money instead flows to foster families. In this vein, there are minimal supports to be able to cover the cost of living
- Lack of resources for child and family services as well as related services which have a major impact on child and family well-being, for example health clinics, therapy, and rehab centers on reserve.
- Youth believe underfunding caused them to be shifted from temporary to permanent wards of the state and even resulted in being adopted to non-Indigenous families
- Attending services and placements not culturally safe therefore resulting in experiences of microaggressions and racism
- Struggling with addiction and mental health with no proper supports
- Experiencing homelessness and poverty especially after aging out of care
- Increased vulnerability of experiencing human trafficking
- Increased interaction with the criminal justice system (for the youth in care as well as their families)
- Lack of supports to succeed in school, resulting in high school dropouts and undiagnosed learning disabilities

When asked "What can Canada do to stop the discrimination in the system of First Nations child and family services?", 91 percent of folks that participating in the survey responded to this question and provided input on what they believed was necessary to stop discrimination in child welfare. The remaining 9 percent of respondents to this question said they were unsure what was needed. It is not responsibility of the survivor of the policies to create the solution but it is up to those in power to listen and accept the wrongdoing and make the systemic changes needed to improve the lives of these young people however it is very encouraging to see so many young people wanting to be involved in

12 https://fncaringsociety.com/publications/wende-journey-continues-wen-de-nous-poursuivons-notre-route

the solutions. Respondents most often suggested family-based solutions, with anti-racism and decolonizing training plus access to information and education following. Here is what they had to say:

- Family Based-Solutions:
  Youth strongly recommended that a family-based approach is fundamental for FNCFS. Instead of breaking up families, there must be support to keep families together as well as uphold more "traditional" social safety nets like aunties, uncles, and grandparents. For example, access to therapy, sufficient income assistance, legal support, reunification homes, transition homes, and more need to be provided in community and support youth with access to family. The option to remove children from their families should not be so readily available in the system. There needs to be support for First Nation community members to take in other First Nations children if their families are unable to.

- Anti-Racism and Decolonization Training:
  Anti-racism and decolonization training was another necessary recommendation from the youth who replied to this question. Everyone involved in the system, from foster parents to policymakers, need to learn about Indigenous history, attend anti-racism training and be actively anti-racist everyday, participate in decolonizing the system, and understand, uphold, and improve the laws and regulations against racial discrimination. The broader public also needs access to this sort of training so they can understand what's occurring too.

- Access to Information and Education:
  Several forms of information sharing and public education are necessary for all this to be achieved too. This includes ensuring information on child welfare is made publicly available, supporting research to access, compile, and interpret that information and data, raising general awareness of Indigenous issues, child welfare, racism, and disabilities, amongst other topics, providing Nation-sensitive cultural training for future child welfare professionals and caregivers, and community-level education to support families and holistic well-being.

"First and foremost, by ensuring that the future of the First Nations child and family Services Act is an anti-assimilation policy."

—Participant

Other ideas raised included: accountability, capital (like infrastructure and buildings), culture, equality and equity, First Nations rights, policies, and resources.

- Accountability mechanisms to address issues of discrimination and poor services, plus to ensure First Nations are included.
- Increased capital, including funding for buildings and other infrastructure.
- Incorporation of culture into design and provision of FNCFS, from both a worldview standpoint and ensuring youth have access to their cultures, territories, languages, and communities.
- Equal and equitable treatment for Indigenous youth in care plus respect for their rights
- Recognition of First Nations rights, sovereignty, treaties, and territories as well as support for First Nations to move to self-governance, take back their children, and protect their lands and reserves.
- Creation of, amendments to, reassessment of, and/or better implementation of policies including but not limited to strengthening and expanding laws against racial discrimination, reassessment of existing child and family services laws and policies, and incorporation of preventative measures.
- Improved and expanded resources, including service navigators, specialized workers, employment opportunities and a basic income, mental health support, access to foods, support kids who age out of care, support parents by implementing Jordan's Principle, increase on reserve funding, access to appropriate housing, creation of healthy healing environments for youth in care and their families, ensuring security for families and youth (social, economic, mental/addictions, physical, and housing), and overall listening to communities needs. All these resources need to be provided in a non-judgmental, non-discriminatory way.

Proper and Ethical Implementation of Solutions

In 2017, the federal government of Canada was forced to implement Jordan's Principle, here is an excerpt from the Government of Canada's website:

The CHRT issued a set of compliance orders on May 26, 2017 (2017 CHRT 14), later amended on November 2, 2017 (2017 CHRT 35), that Jordan's Principle is based on the following key principles:

- **applies to all First Nations children, on and off reserve**
- **ensures there are no gaps in government services**
- **government or department of first contact will pay without case conferencing or other similar administrative procedure before the recommended service is approved and funding is provided**
- **needs are evaluated on the basis of substantive equality, culturally appropriate services and to safeguard the best interests of the child**
- **a dispute among departments or government is not necessary**
- **provides services within a 12- to 48-hour timeframe and publicize funding**

However despite these promises, over half of the respondents we spoke to had never heard or accessed Jordan's Principle despite sharing many stories of having no access to mental health supports, cultural and basic needs. Jordan's Principle could be a lifeline for many First Nations children however it must be implemented properly and gaps in services must be remedied.

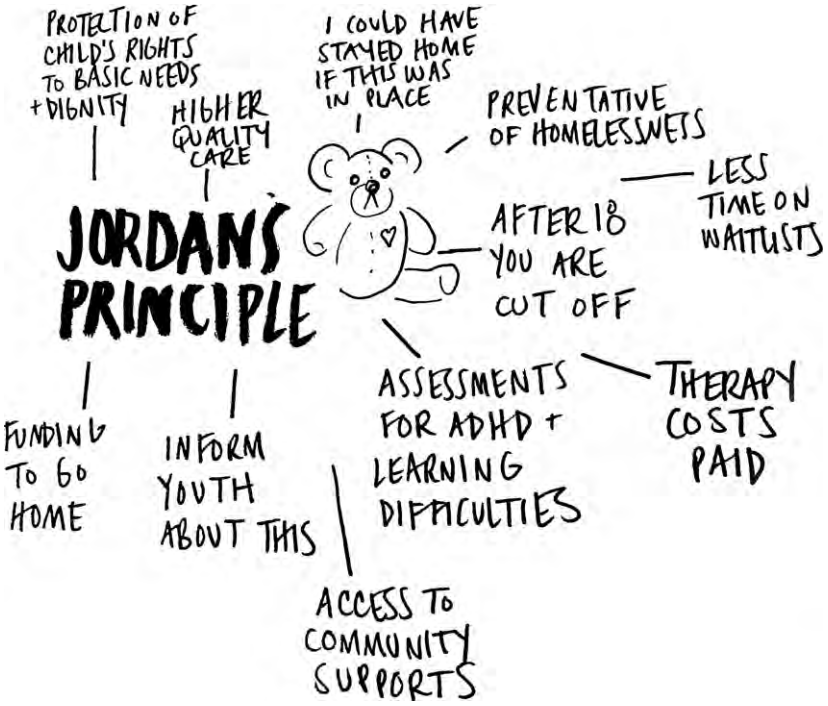


FIGURE 6. **Have you ever accessed Jordan's Principle?**

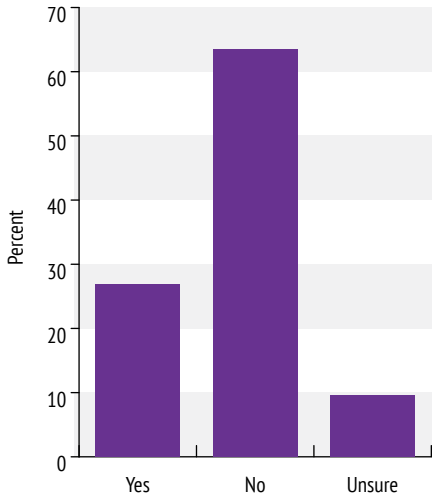


Source: Participant survey.

The following is a list of how Jordan's Principle can be better implemented. These solutions continue to echo solutions for Child Welfare Reform as well.

- Funding to go back home to visit
- Therapy costs paid
- Having assessments for learning difficulties and ADHD
- Continued access past 'aging out'
- Less time on waiting lists, quicker access to services
- Receiving higher quality services and resources
- Informing youth and youth workers about JP
- Protection of child's basic rights to dignity and basic needs
- Advocating for children's rights and needs
- Access to community (supports)
- A number they can call to talk to someone about their specific situation and if it can be helped
- Need to know what services and supports exist

An infographic created by Cindy Blackstock and the Caring Society highlighting the ongoing patterns perpetuating discrimination that harm Indigenous children experiencing Child Welfare and must be addressed:

Remoteness – a Distinct Experience for First Nations Youth In and From Care

> **"Definitely funding to visit my home community. I have never visited my home community once. (It is a fly in remote community and costs on average $1,200 for a round trip)."**
>
> *—Participant*

Of the 49 percent of respondents who indicated they're from a remote or fly-in community, 46 percent indicated they were from Ontario and 31 percent indicated they're from British Columbia. Note that some of the respondents indicated they were in care in both provinces. A few respondents indicated they were from a remote or fly-in community in Alberta, Saskatchewan, Quebec, Newfoundland and Labrador, and Nova Scotia. Most respondents who indicated they were from a remote or fly-in community identified as First Nation, and a majority of those respondents identified as having First Nations status. Only two respondents who indicated they were from a remote or fly-in community identified as only Metis and not First Nation.

Many of these responses in the "Ending Discrimination" section of the survey highlighted similar issues, wants, and needs to First Nations youth from non-remote communities, for example keeping families together, social service navigators, support accessing housing and when aging out, and funding to visit or reconnect to communities, families, and traditional territories, amongst other ideas.

However, some unique responses were also given. The words "equal" and "equality" were used by several respondents from remote communities in their responses across all the questions in this section. Respondents wanted to be equal to everyone else, to have equality in child and family services provision, experience equal access to services, and ensure equal rights are recognized and upheld.

When asked what Canada could do to stop discrimination in FNCFS, a respondent from a remote community indicated that Canada needs to "increas[e] capital," for example more and/or improved infrastructure like clean water systems and more and/or improved buildings like houses, service centres, and community centres. Another respondent from a remote community stated that realities that First Nations youth in and from care face must be shown to the public.

> **"They should start showing more about the [realities] of how we get treated in care… They should show how much we get taken and separated from [our] land into bad places"**
>
> *—Participant*

When asked what youth personally want or need to address the impacts of the discrimination, several respondents indicated in addition to various supports discussed earlier and elsewhere in the report, they needed funding for recreational and material needs (like hockey equipment, a laptop for school, desk and chair, etc.) as well as to be able to be considered by their band for supports available to those who weren't removed from their communities, like post-secondary education funding and certain financial supports.

First Nations Youth In and From Care Are the Experts

Lastly, what we heard was a lot of solutions!

Despite surviving child welfare and the many traumas that First Nations youth have experienced at the hands of Canada, there is still so much hope for themselves and the future generations. These young people took time out of their days to clearly express to Canada how they want to be treated and what the solutions to seeing a future of thriving First Nation communities and youth looks like. We had put their solutions and visions for the future directly into the next section: What Needs to Happen.

What Needs to Happen

Past (Prevention)

While we cannot turn back time to undo the harm and abuse that Indigenous youth and children have experienced in child welfare, we can use the lessons of hindsight and the generations of reports, recommendations and solutions to prevent harm and abuse from happening to another generation of Indigenous youth and children.

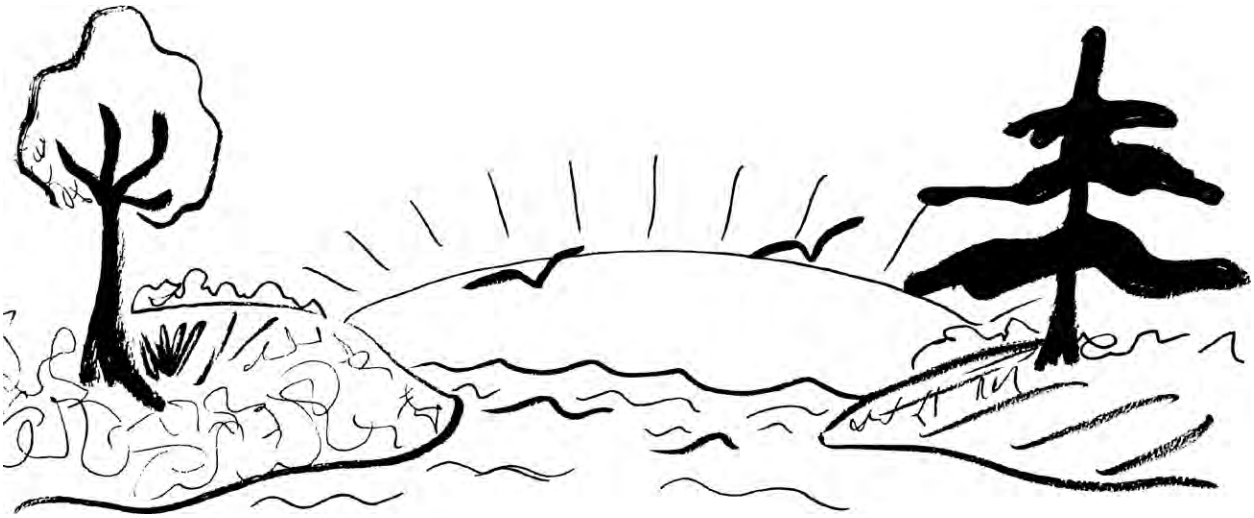
> **"Acknowledging colonialism and trauma. Understanding negative impact and discrimination against Ind [sic] people"**
>
> *—Participant*

1 *Acknowledgement Followed by Action*

Canada and its provinces/territories must acknowledge and be honest about the violence they have caused to Indigenous youth and children and their families through their policies and legislation. This acknowledgement of past and ongoing violence must be followed up with actions and systemic changes.

> **"Nothing for us without us"**
>
> **"for Indigenous, by Indigenous"**
>
> *—Participants*

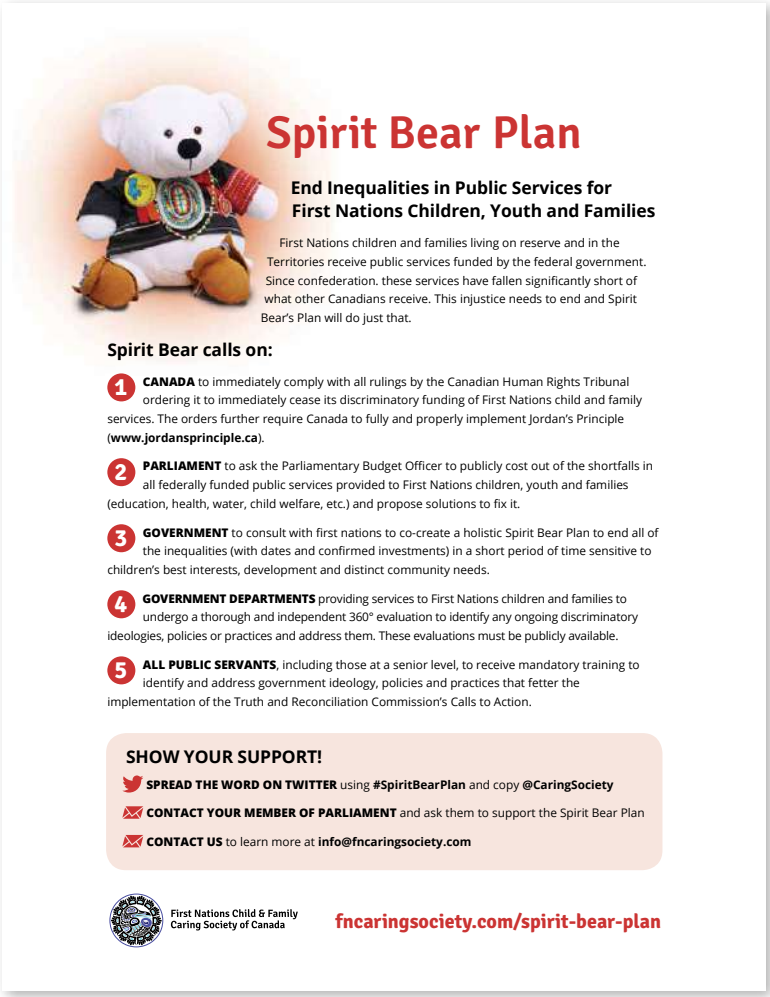
Within this acknowledgement, Indigenous rights as well as distinctions-based rights, treaty rights, and inherent rights must be recognized. Indigenous peoples must be involved in every aspect of these systems that impact them **alongside evaluation of these systems to ensure ideologies are remedies**. Furthermore, First Nations must be supported to move to self government with culturally based and equitable funding if they want to go that path.



> **"Recognizing that these are children they're dealing with, not just a number in the system. I am a human and need to be treated like one. I feel that their [sic] needs to be more supports for these children. Most of these kids are going to live with so many psychological problems because of the system."**
>
> *—Participant*

Canada must fully implement the Truth and Reconciliation Commission 94 Calls to Action and the Calls to Justice from the National Inquiry into Missing and Murdered Indigenous Women and Girls. The Survivors who bravely gave their testimony in the course of the Commission and Inquiry gifted Indigenous peoples and Canadians the Calls to Action and Calls to Justice to ensure that not one more generation of Indigenous young people have to experience what they experienced. Indeed, the findings of both the Commission and Inquiry found that the ongoing overrepresentation of Indigenous child in the child welfare system is the legacy of the residential school system, 60s Scoop, removal from land, and other forms of colonialism.

The Spirit Bear Plan is also an important guide to fulfill this much needed work.



Spirit Bear Plan

End Inequalities in Public Services for First Nations Children, Youth and Families

First Nations children and families living on reserve and in the Territories receive public services funded by the federal government. Since confederation. these services have fallen significantly short of what other Canadians receive. This injustice needs to end and Spirit Bear's Plan will do just that.

Spirit Bear calls on:

1. **CANADA** to immediately comply with all rulings by the Canadian Human Rights Tribunal ordering it to immediately cease its discriminatory funding of First Nations child and family services. The orders further require Canada to fully and properly implement Jordan's Principle (**www.jordansprinciple.ca**).
2. **PARLIAMENT** to ask the Parliamentary Budget Officer to publicly cost out of the shortfalls in all federally funded public services provided to First Nations children, youth and families (education, health, water, child welfare, etc.) and propose solutions to fix it.
3. **GOVERNMENT** to consult with first nations to co-create a holistic Spirit Bear Plan to end all of the inequalities (with dates and confirmed investments) in a short period of time sensitive to children's best interests, development and distinct community needs.
4. **GOVERNMENT DEPARTMENTS** providing services to First Nations children and families to undergo a thorough and independent 360° evaluation to identify any ongoing discriminatory ideologies, policies or practices and address them. These evaluations must be publicly available.
5. **ALL PUBLIC SERVANTS**, including those at a senior level, to receive mandatory training to identify and address government ideology, policies and practices that fetter the implementation of the Truth and Reconciliation Commission's Calls to Action.

2 *Creation of Youth in Care Accountability Mechanism*

It is an understatement to say that the relationship between Indigenous youth, children, families and communities and Canada is tense and strained. Trust has been broken. Those that have been impacted by child welfare want to see justice and accountability. Canada cannot be trusted to make the best decisions for Indigenous youth and children and Canada's promise to do better cannot be trusted. Until trust can be rebuilt, there must be a mechanism in place that can hold Canada accountable. This mechanism must be led and designed by Indigenous youth as mentioned in *Accountability in Our Lifetime: A Call to Honour the Rights of Indigenous Children and Youth:*

Prior to establishing a National Children's Commissioner, Indigenous youth must be ethically engaged in the decision making process. This looks like:

- Holding regional gatherings with Indigenous youth.
- Discussions regarding a National Children's Commissioner are not predetermined.
- Research following the guidelines from A Way Forward: Ethical Engagement with and by Indigenous Youth.
- Indigenous youth and children need space to determine what the best Youth Accountability Mechanism will look like.

An accountability mechanism would have functions such as responding to complaints from Indigenous youth and families, supporting access and navigation of Jordan's Principle, evaluating and reviewing child welfare services and upholding a standard of ethics (see Recommendation 3). Such a mechanism would need to be inclusive of all Indigenous youth, not just those age 18 and under. It would need the ability to make binding orders that address the systemic reforms required as well as any other powers that the youth may have described.

All forms of abuse, especially physical and sexual abuse, must be taken very seriously. Survivors must be prioritized and perpetrators must be held

accountable. Survivors of abuse while in care should be provided mental health and survivors' supports immediately and throughout their life as long as needed.

There needs to be a "measuring stick" for the ongoing need for mental health, physical health, preventative supports, access to material needs and other important needs and outcomes.

3 *Ethical Indigenous Youth Standard Accompanied by Accountability and Reviews*

Public servants, such as social workers, policy makers, and police officers, as well as group home workers and any person in close proximity to youth in care must be properly trained in anti-racism, the history of colonization, the impact of child welfare on Indigenous families and communities and cultural competency in relation to the Indigenous territory they are operating on and the Indigenous nations they are working with. Anyone working with Indigenous youth and children must have a reliable security clearance and vulnerable persons check.

Indigenous youth, children and families must have access to complaints procedures regarding any type of inappropriate behaviours, abuse and/or racism made by social workers, group home workers, etc. Service providers that are working closely with Indigenous youth and children such as foster homes, group homes, etc. must be evaluated regularly by Indigenous youth in/from care.

"You have the right to food, clothing, a safe place to live, and opportunities to do what others can. The government should help families and children who cannot afford this."

— Article 27, United Nations Convention on the Rights of the Child

4 *Keeping Families Together*

The biggest reason for the amount of Indigenous youth and children in care is due to underfunding for basic needs that all families should have access to.

In order to address to the overrepresentation of Indigenous youth and children in care, families must have access to culturally relevant services and supports, including but not limited to the following:

- Training and resources for parents with children with diverse types of disabilities (learning, visual, physical, illness, etc.)
- Therapy and mental health supports
- Trauma-informed, comprehensive social services
- Peer-to-peer supports
- Kinship Care
- Employment, Trades and Skills Development opportunities
- Safe and proper housing
- Clean water
- Access to food and clothing
- Post-secondary schooling
- Addictions counselling
- Access to land and ceremonies
- Cooking classes
- Daycares and nurseries
- Doulas and midwives
- Coping skills
- Hobbies for children (e.g., swimming classes, dance classes, etc.)
- Access to sports
- Emergency fund for families and youth (e.g., to prevent eviction, respond to family emergencies, etc.)

5 *Fair and Equitable Funding*

There must be a transition of funding from reactive measures to preventative measures. Many participants recall being removed from their families due to poverty while being placed in a non-Indigenous family who was offered compensation to look after them. If there is funding to cover the removal of Indigenous youth and children from their families, there is funding to keep families together. The existing funding models must be adjusted to put the well-being of Indigenous youth and children first before investing into institutionalization.

Canada and its provinces must come to the realization that the longer Indigenous youth and children are underfunded and harmed through systemic

abuse, the more it will cost taxpayers in the long run. This has been described in terms of the child welfare to prison pipeline, hospitalization and health care costs, class action lawsuits, etc. **Funding needs to be equitable, culturally relevant and tied to the well-being of young people. Funding must aim towards the thriving of Indigenous peoples and not bare minimal survival and often time less than survival.**

This looks like providing funding for services and supports recommended in #4 as well as committing to the creation of a foundation for youth in care (#11).

"The anticipated economic, social and cultural benefits of fully implementing the recommended reforms are substantial, benefiting First Nations children, families, Nations and Canadian society at large. The social benefits are significant–the cost is minimal representing 1.25% of the 8 billion dollar surplus budget that Canada reported in 2004/2005."

—Wen:De: The Journey Continues[13]

"First and foremost, by ensuring that the future of the *First Nations child and family Services Act* is anti-assimilation policy. Specifically, scrapping the 'best interest of the child' policy. This policy fails to recognize that the unfortunate living circumstances Indigenous children find themselves in is a direct consequence from the Indian Residential School system. But how is it ever a good idea to place children from one bad situation into another?"

—Participant

13 https://fncaringsociety.com/publications/wende-journey-continues-wen-de-nous-poursuivons-notre-route

Present (While in Care)

There are currently thousands of Indigenous youth and children in care that are in need of proper and ethical services immediately.

6 *Commitment to Restoring and Preserving Indigenous Cultures and Languages*

> **"I remember being a teenage [sic] and connecting the dots between my own lived experience and colonialism. I was so hurt and entered a deep state of depression and lashed out by including in drugs and alcohol. I definitely would say at the time I needed trauma informed mental health services, financial support to visit my community and access to land-based activities."**
>
> *—Participant*

Community and cultural connections while in care is absolutely integral for the well-being of Indigenous children and young people. Over half of respondents identified access to culture as a fundamental support. Steps to revitalize and preserve to safeguard Indigenous cultures and languages can include, but are not limited to:

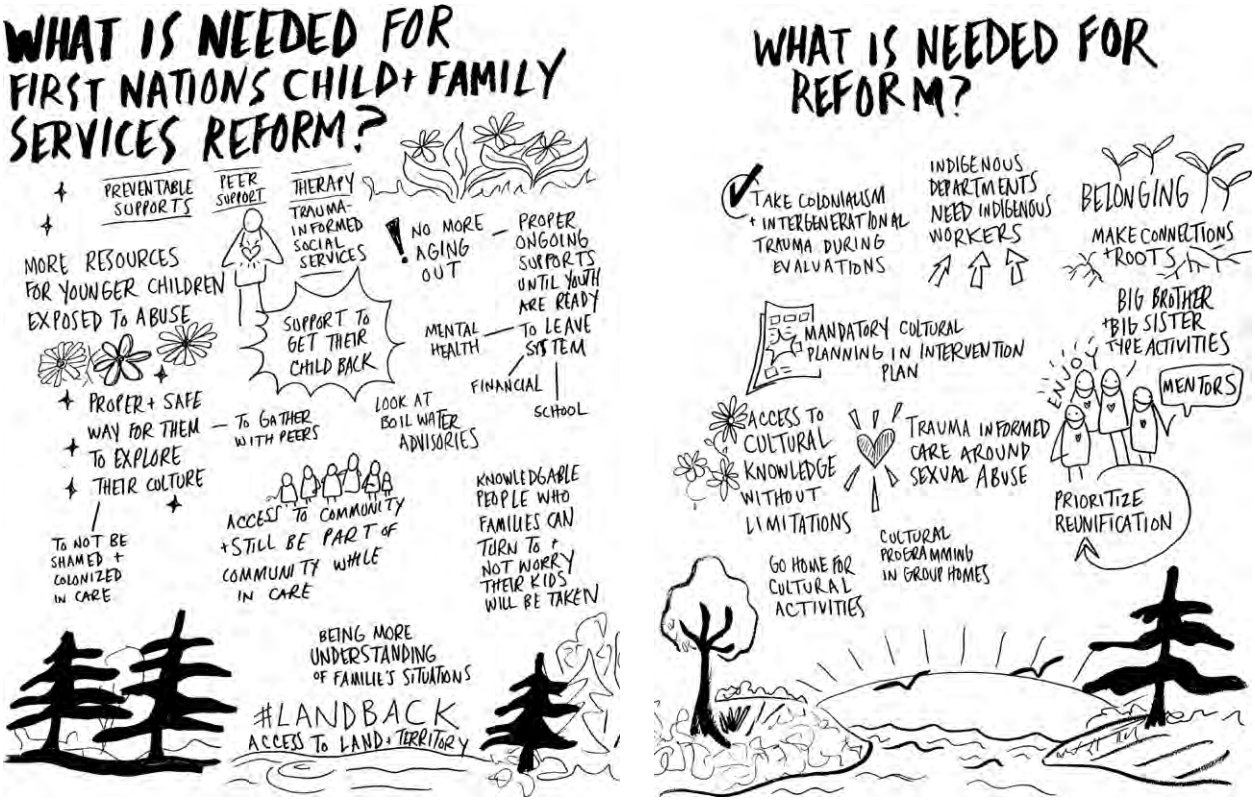
- Maintaining family connection (each family may have their own traditions, knowledge of the land on their trapline, etc.)
- Access to Native youth groups, especially those led by fellow native youth
- Access to culture including ceremony, language, elders/ knowledge keepers, and other cultural mentors

- Visits to community
- Land-based activities and visits to traditional territory
- Safe spaces when visiting community, learning about culture and land-based activities, including space to live, eat, hang out, etc.

7 *A Moratorium and Evaluation of Discriminatory or Problematic Programs and Policies:*

Policy is one of the most significant methods for the government to take action. Government programs and policies that have a close proximity to Indigenous children and youth must undergo an evaluation to identify any discriminatory mindsets, policies, practices, and remedy them. This includes but is not limited to strengthening and expanding protections from laws against racial discrimination, addition of funding and anti-discrimination clauses to existing child and family services laws and policies, and incorporation of preventative measures. The Indigenous children and youth impacted by these programs and policies must be closely involved in this evaluation.

Future (After Experiencing Child Welfare)



8 *Family Reunification Services*

While the decision to reconnect with family and community should be fully up to the person who experienced child welfare, the systems that removed the youth or child need to be responsible for reuniting the youth and their families.

Reconnecting with family and community should not be at the expense of the youth who were placed in child welfare. There must be supports which fund youth to visit their communities and traditional territories, (re)connect with their families, and manage the mental impact of this reunification.

- Some examples of what services and supports that must be covered include but are not limited to:
- Services that help find birth family and records or files
- Services that mediate and facilitate contact with initial meetings and going home
- Access to potential mental health supports when going through the reunification
- Travel and accommodations to visit community and family that include supporting people and family.

9 *Supports to Transition into Adulthood*

Presently, supports to "age out" of child welfare vary by province and territory. The First Nations Child and Family Services program ends care at age 18, though there is an ongoing moratorium on "aging out" of care due to the COVID-19 pandemic. The Federal 2021 Budget promised to "permanently ensure that First Nations youth who reach the age of majority receive the supports that they need, for up to two additional years, to successfully transition to independence." It is essential to listen to and incorporate feedback from the youth who will be impacted by this policy change. The decision to formally transition into adulthood must also be made in consultation with the youth leaving care – including based on their own readiness level. Supports must be provided to help youth transition into adulthood. These supports include but are not limited to:

"It has impacted my whole family. I'm 25 now and I struggle more than I did as a child in care. As I get older the more I realize things that happened in the foster homes I was placed in were not right, racial slurs, verbal/mental/physical abuse…"

—Participant

- A "social safety net" of community, workers, resources, and supports. This includes multiple specialized workers (e.g., transitional workers, housing worker, youth support worker, employment support worker, and cultural connections worker), peers-to-peer supports, Indigenous youth organizations, Indigenous community, family (including chosen), healthcare

providers, auntie/uncle supports, Elder supports and others as identified by youth. This safety net must include readily available information on important community resources and culturally based and equitably funded social programs.

- Safe, appropriate, accessible housing and other infrastructure (water, transportation, etc.)
- Life skills training and assistance (how to cook, do taxes, access to SIN number, getting drivers' license and other IDs)
- Financial support, including a Registered Education Savings Plans (RESP) with contributions from the government and financial management education and access to an emergency fund (to tap into when, for example, facing eviction, family emergencies, etc.)
- Trauma-informed, accessible, and continuous healthcare. It is important health services, including mental health, sexual health, gender affirming care, and harm reduction care, are not cut off once Indigenous youth in care transition to adulthood
- Supporting community and cultural (re)connection, including funding to move to or visit community, participate in land-based activities, and spend time with cultural and language mentors
- Support to finish education at both highschool and postsecondary levels, without age or time limits

10 *Establishing a National Network of Indigenous Youth In/From Care*

This is an ongoing recommendation from the first Gathering of First Nations Youth in Care in 2019. Youth that attended the 2019 and the 2021 gatherings both indicated that they want to stay connected and share their experiences with each other. They also indicated that they want to be involved in decision making that will affect child welfare because they are the experts of this experience.

This was the first national level gathering of its kind for First Nations youth in and from care. The Youth Advisors said they want to continue to have the time and space they need to discuss important and pressing issues, including the following.

1. Become a collective of First Nation Youth Advisors in and from care

- a. share best practices
- b. share updates
- c. continue advocating for reform
- d. host more policy round tables across the country
- e. advise on court rulings, contribute to policy development, share testimonies, etc.

2. Continue to meet about compensation and settlements

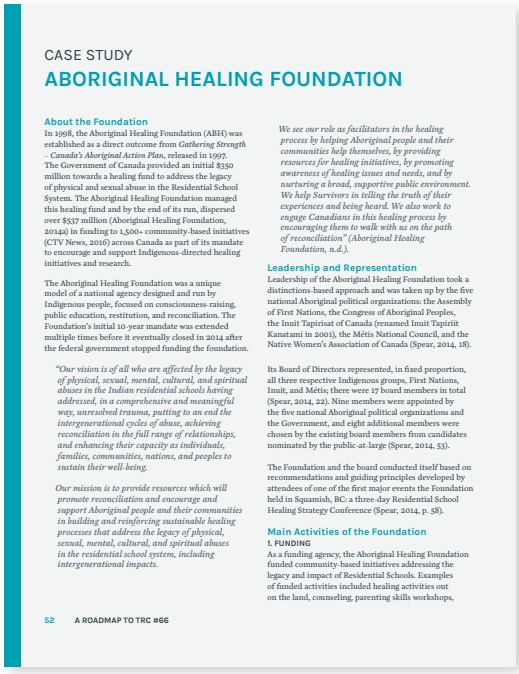
a. learn more about options such as trusts, individual pay-outs, hybrid approaches, etc.

b. keep learning about trust funds, scholarships, pooling compensation, etc.

c. learn about best practices regarding settlements from other Indigenous communities

11 *Creation of a Foundation*

The creation of a foundation is not in place of compensation that will justly be offered to survivors of the child welfare system but should be complementary to funding reform as stated in recommendation 5.



CASE STUDY

ABORIGINAL HEALING FOUNDATION

About the Foundation

In 1998, the Aboriginal Healing Foundation (ABH) was established as a direct outcome from *Gathering Strength – Canada's Aboriginal Action Plan*, released in 1997. The Government of Canada provided an initial $350 million towards a healing fund to address the legacy of physical and sexual abuse in the Residential School System. The Aboriginal Healing Foundation managed this healing fund and by the end of its run, dispersed over $537 million (Aboriginal Healing Foundation, 2014a) in funding to 1,500+ community-based initiatives (CTV News, 2016) across Canada as part of its mandate to encourage and support Indigenous-directed healing initiatives and research.

The Aboriginal Healing Foundation was a unique model of a national agency designed and run by Indigenous people, focused on consciousness-raising, public education, restitution, and reconciliation. The Foundation's initial 10-year mandate was extended multiple times before it eventually closed in 2014 after the federal government stopped funding the foundation.

> *"Our vision is of all who are affected by the legacy of physical, sexual, mental, cultural, and spiritual abuses in the Indian residential schools having addressed, in a comprehensive and meaningful way, unresolved trauma, putting to an end the intergenerational cycles of abuse, achieving reconciliation in the full range of relationships, and enhancing their capacity as individuals, families, communities, nations, and peoples to sustain their well-being.*
>
> *Our mission is to provide resources which will promote reconciliation and encourage and support Aboriginal people and their communities in building and reinforcing sustainable healing processes that address the legacy of physical, sexual, mental, cultural, and spiritual abuses in the residential school system, including intergenerational impacts.*
>
> *We see our role as facilitators in the healing process by helping Aboriginal people and their communities help themselves, by providing resources for healing initiatives, by promoting awareness of healing issues and needs, and by nurturing a broad, supportive public environment. We help Survivors in telling the truth of their experiences and being heard. We also work to engage Canadians in this healing process by encouraging them to walk with us on the path of reconciliation" (Aboriginal Healing Foundation, n.d.).*

Leadership and Representation

Leadership of the Aboriginal Healing Foundation took a distinctions-based approach and was taken up by the five national Aboriginal political organizations: the Assembly of First Nations, the Congress of Aboriginal Peoples, the Inuit Tapirisat of Canada (renamed Inuit Tapiriit Kanatami in 2001), the Métis National Council, and the Native Women's Association of Canada (Spear, 2014, 18).

Its Board of Directors represented, in fixed proportion, all three respective Indigenous groups, First Nations, Inuit, and Métis; there were 17 board members in total (Spear, 2014, 22). Nine members were appointed by the five national Aboriginal political organizations and the Government, and eight additional members were chosen by the existing board members from candidates nominated by the public-at-large (Spear, 2014, 53).

The Foundation and the board conducted itself based on recommendations and guiding principles developed by attendees of one of the first major events the Foundation held in Squamish, BC: a three-day Residential School Healing Strategy Conference (Spear, 2014, p. 58).

Main Activities of the Foundation

1. FUNDING

As a funding agency, the Aboriginal Healing Foundation funded community-based initiatives addressing the legacy and impact of Residential Schools. Examples of funded activities included healing activities out on the land, counseling, parenting skills workshops,

52 A ROADMAP TO TRC #66

Canada must invest in an endowment towards the creation of a foundation that would be led by Indigenous youth and children in care and their allies. The foundation would also be able to receive donations from private and public donors. The foundation would be able to offer Indigenous youth and children in and from care the opportunities to do community-based programs and projects working on healing and cultural restoration as well as create a fund which young people in urgent situations can access. The Aboriginal Healing Foundation is an example of a best practice.

Source: Indigenous Youth Voices. (2018). *A Roadmap to the Truth and Reconciliation Commission Call to Action #66.* https://www.a7g.ca/uploads/9/9/9/1/99918202/final__2_-_indigenous_youth_voices_-_roadmap_to_trc_66_-_compressed.pdf

Closing

The overrepresentation of children and youth in care would not exist if it was not for the underfunding or lack of funding for basic needs such as proper housing, clean drinking water, employment opportunities and unresolved trauma from discriminatory programs and policies such as the residential school system. Canada must admit to these acts of genocide and commit to working towards the solutions as indicated by Indigenous children, youth, families, communities and their allies.

"I'm really hoping, that people can see us as people."

—Focus Group Participant

The irony is that discriminating against Indigenous children and youth is an unnecessary expense for Canadians. Underfunding basic needs of Indigenous children and families actually costs governments more money in the long term than investing in the solutions. Canada has ignored the red flags for far too long by ignoring Indigenous voices and in some cases, directly invested in the discrimination against Indigenous children and youth. It is painful for survivors to imagine how their lives could have been if their well-being was honoured and respected but Canadians now have an opportunity to correct the inequalities and invest in bright and beautiful futures of all First Nations children and youth. It is not too late and hope is still alive that First Nations children and youth can not only survive but they can thrive.

"Children and youth with complex needs face multiple, interconnected challenges which require formal collaboration among departments/ agencies, including but not limited to, child welfare, schools through sporadic attendance, the youth justice system, emergency departments dealing with violent injuries, and mental health/ addiction crisis and treatment services. The most complex children and youth are estimated to cost the province between $1 and $2 million per child per year and with limited positive life outcomes (2018, p.41)."

SHARE WITH EVERYONE SO WE CAN EDIT IF NEEDED

Appendix

This appendix contains short notes which compile answers from several of the key questions asked in the survey. This appendix should not be used as a limiting factor for services, supports, and funding which go beyond the wants and needs identified by youth in/from care here.

Q10: What can Canada do to stop the discrimination in the system of First Nations child and family services?

- Support families to stay together, including through improvements to other social programs like income assistance and reunification homes or transition homes.
- Provide preventative supports that strengthen families like addictions treatment and supports, fostering healthy environments for families, and ensure "security" for children and families (social, economic, mental, and physical)
- Uphold "traditional" social safety nets like aunties, uncles, and grandparents.
- Support youth who age out
- Implement Jordan's Principle
- Increase on-reserve funding
- Support self-government, recognize First Nations rights, listen to communities and involve in every aspect of these systems and changes
- Recognize trauma, provide mental health supports
- Service navigators for youth
- Employment and income support for families and youth in/from care
- Cultural events
- Culturally appropriate approach to child and family services (CFS)
- Adequate resources and funding
- Professional, non-discriminatory workers
- Anti-racism education and laws
- Ensure basic human rights, equal rights, etc. are met and upheld
- Access to information, public awareness, public education, and research
- Increased capital, including infrastructure like housing and clean water
- Proper policies
- Accountability methods to address discrimination, poor services, and ensure First Nations are included

Q11: What must Canada do in order to prevent discrimination from ever occurring again in this way?

- Safe homes
- New and/or revised policies, laws, and regulations at all government levels
- Unpack and address systemic racism and biases. Decolonize. Provide anti-racism training and reparations
- Accountability mechanism(s)
- Accessible resources and organizations which provide them
- Cultural and traditional knowledge incorporated into systems of care
- Fair evaluations from band councils for customary care
- Family support without needing to be reported to CFS. Combined child and parent supports and programs, so they don't need to be separated to heal.
- Education (anti-racism, about the system, etc.) and information made public.

Q12: If you have experienced negative impacts from the discriminatory underfunding, is there anything you personally would want or need to address these impacts? (e.g. family reunification services, funding to visit your traditional territory/community, housing supports (note these examples are based on feedback received from the Youth Advisors at the Fall 2019 gathering))

- Reunification services
- Housing access and supports (for youth alone, as well as families, as well as safe new housing), credit and co-signer, damage deposits, etc.
- Educational supports for completing high school, university, etc.
- Counselling, therapy, and other mental health supports (including addictions support from a harm reduction approach)
- Parental supports for both parents whose children may be apprehended and youth in care who are also parents
- Reparations for suffering
- Comprehensive, equitably funded social assistance and case management services
- Accountability
- More funding while in care, including for stuff considered "extra" like recreational activities, laptops, clothing, supports (tutors, etc.)
- Greater support from band for everything
- **NOTE:** a couple of respondents said they'd give their resources to others because they're doing mostly okay and know others aren't. They might be coming from the understanding (and current reality) that funds and supports are limited and therefore believe they need to reduce their rightful supports or minimize their needs so others in greater need can have access. It shouldn't be like this!

Q19: Please share what supports you believe could be helpful to maintain connection (e.g. financial support to visit community, access to land-based activities (note these examples are based on feedback received from the Youth Advisors at the Fall 2019 gathering))

- Native youth groups
- Maintaining family connections
- Indigenous workers
- Cultural access including ceremony, language, and elders/knowledge keepers
- Safe spaces
- Infrastructure like water and housing on reserve
- Accountable CFS
- Life skills (getting a bank account, getting a SIN, doing taxes, etc.)
- Land-based programs and access
- Visits to community
- Adequate funding for all this

Q20: As an Indigenous youth in/from care, what supports did you or do you need to transition to adulthood?

- Housing (safe, proper, etc.), phone and internet plans, furniture, and laptops
- Workers for transitions, youth support, housing, cultural connections, etc. – case management and service navigators
- Peer support programs
- Community resource list and accessibility
- Cultural mentors and language mentors
- Mental health support – trauma informed too!
- Transportation that is accessible and available
- Financial support, education, and management (including RESP)
- Employment access and support
- Life skills development (help getting license, filing taxes, etc.)
- Healthcare access (culturally appropriate, continuous, 2SLGBTQIA+ friendly)
- Access to land-based activities
- Funding to visit or move to community
- Fair funding for all social programs
- Harm reduction services and rehab options
- Education support
- One respondent said: "*I cant comment on this because I have no idea even how to*"

First Nations Child and Family Services and Jordan's Principle Class Action

Framework of Essential Services

Who can claim compensation for not receiving an essential service from Canada or receiving it after delay?

A claim for compensation can be made if:

1. An essential service was needed by the claimant; and

2. The claimant or someone on behalf of the claimant asked Canada for an essential service that was denied or delayed in being provided. Or, the claimant needed the essential service, but it was not available or accessible to them (there was a gap in services), even if they did not ask for the service.

What is an "essential service"?

A service is considered essential if the claimant's condition or circumstances required it and the delay in receiving it, or not receiving it at all, caused material impact on the child.

Examples of types and categories of essential services are attached as an appendix to this Framework.

If the claimant needed a service that is not on the list of examples, it may still be considered an essential service under the settlement if not receiving the service had a material impact on the child.

What timeframe is covered?

Claimants are covered by this settlement if they needed the essential service as a child at any time from April 1, 1991 to November 2, 2017.

How to make a claim?

1. If the claimant requested a service from Canada that was delayed or denied, they may provide a copy of the letter, email or other document submitted to Canada requesting the service. If they do not have a copy, they may provide a statutory declaration confirming that they requested the service.

2. If the claimant did not request a service from Canada but required an essential service that was not available or accessible, they need to provide confirmation from a professional saying what essential service they needed, why it was essential and when they needed it, either through historical documentation or contemporary confirmation by a professional.

Confirmation can be in two forms depending on the answer to the following question:

Does the claimant have any kind of historical document stating that an essential service was needed?

If the answer is **YES**, please follow **Procedure A.**

If the answer is **NO**, please follow **Procedure B.**

Procedure A (to be completed if claimant has historical documentation confirming that an essential service(s) was/were needed)

1. Complete the Claim Form (when available).
2. Provide copies of the historical documentation confirming that an essential service(s) was/were needed.
3. If the historical documentation lacks specifics on the confirmed need for the identified essential service, a professional may complete the Professional Confirmation of Essential Services Form.
4. Complete the questionnaire (when available).

Procedure B (to be completed if the claimant has NO historical documentation stating that an essential service(s) was needed.

1. Complete the Claim Form (when available).
2. A professional completes the Professional Confirmation of Essential Services Form (when available).
3. Complete the questionnaire (when available).

What is historical documentation?

Historical documentation refers to old documents such as a health record or an assessment conducted by a health, social care professional, educator, or other professional or individual with expertise and knowledge of the need for this essential service and/or support.

Is there help in claiming compensation?

Yes. Once the claim form and other supporting documents are available, they will be released online at www.fnchildcompensation.ca. Support in completing these forms will be available through the Administrator.

Appendix – Examples of Essential Services

1. Some services provided by, or under the guidance and direction of, health, social care, and educational professionals who specialize in:

    a) Recommending services and supports with activities of daily living and safety in the home, school and community (e.g., occupational therapists, *adapted feeding devices*)

    b) Helping individuals with expressive and receptive language skills (e.g., speech and language pathologists, *augmentative and alternative communication*)

    c) Helping individuals with movement of their hands, arms, and legs (e.g., physiotherapists, *mobility devices*)

    d) Giving and interpreting hearing tests and recommending assistive devices related to hearing (e.g., assessment of hearing by audiologists, *hearing devices*)

    e) Testing vision and recommending corrective eyewear (e.g., optometrists, *advising on eyewear*)

    f) Teaching children with learning needs (e.g., special needs education teachers; supported child development consultants)

    g) Promoting infant, early childhood or adolescent development[1] (e.g., infant development consultants, child and youth workers, or early childhood educators).

    h) Conducting psychoeducational assessments, and provision of counselling (e.g., psychologists, social workers)

    i) Addressing delayed or problematic behaviours (e.g., early childhood educators, behavioural specialists, child and youth workers, social workers,)

    j) Recommending a specialized diet or nutritional intake (e.g., nutritionist, dietitian)

2. Equipment, products, processes, methods and technologies that are recommended in a cognitive assessment or individualized education plan.

3. Medical equipment, such as:

    a) Equipment, products and technology used by people to assist with daily activities (e.g., environmental aids, including lifts and transfer aids and professional installation thereof)

[1] Development refers to physical, social, cognitive, and mental health development

b) Products and technology for personal indoor and outdoor mobility and transportation (e.g., mobility aids that include standing and positioning aids and wheelchairs)

c) Hospital bed

d) Medical equipment related to diagnosed illnesses (e.g., percussion vests, oxygen, insulin pumps, feeding tubes)

e) Prostheses and orthotics

f) Specialized communication equipment (e.g., equipment, products, and technologies that allow people to send and receive information that would otherwise be done verbally)

4. Medical transportation related to access to essential services, supports or products where the lack of transportation prevented access to the recommended service (e.g., people in remote/isolated, semi-isolated communities)

5. Specialized dietary requirements

6. Treatment for mental health and/or substance misuse, including inpatient treatment

7. Oral health (excluding orthodontics), such as:

    a. Oral surgery services, including general

    b. Restorative services, including cavities and crowns

    c. Endodontic services, including root canals

    d. Dental treatment required to restore damage resulting from unmet dental needs

8. Respite care

9. Surgeries

This is **Exhibit "D"** to the affidavit
of Janice Ciavaglia, affirmed
before me on this 6th day of September, 2022

A Commissioner for taking Affidavits etc.
Adam Williamson
LSO# 62751G

Professional's Confirmation of Essential Service Form

Guidelines for professionals completing this form

1. The purpose of this form is to assist those who are assisting claimants in obtaining official documentation to support their claim for class action compensation for Canada's historic failure to provide access to essential services to First Nations children at all or in a timely manner (e.g. past breaches of Jordan's Principle). First Nations claimants must demonstrate having experienced a denial, delay, or gap in an essential service. Historical documentation may be available for the denial or delay, whereas evidence of a gap can only be demonstrated by the completion of this Professional's Confirmation of Essential Service Form. Similarly, inadequate historical documentation may be supplemented by this Professional's Confirmation of Essential Service Form.

2. This form and the confirmation provided through it rely on a retrospective account of an essential service that was needed and its' association with how the claimant currently functions in, and experiences, their social world. There is no requirement to make a causal link (although in some cases this may be possible) between the essential service that was needed and not provided and how the claimant currently functions in and experiences their social world.

3. The intention in this form is to allow claimants who lack medical records to make a claim for compensation, and to avoid the claims process itself becoming an obstacle to their access to recompense for past harms.

4. Please complete this form if the claimant's identified need is within your general area of expertise. You do not have to be a specialist or medical doctor to complete this form (see list below).

5. If you are not able to complete this form for any reason, please consider referring the claimant to another professional with relevant expertise who may be able to assist the claimant in this regard.

6. It may not be necessary for you to consult archival records if you are comfortable completing the form based on your personal knowledge of the claimant and their needs while they were a child, or based on your current observations and the information provided by the claimant.

7. Please take into consideration what the 'standard of care or support' was at the time that the child needed the essential service(s). Bear in mind, that the nature of the claims in the Final Settlement Agreement will not have an impact on how present or future care, needs, or health circumstances of the claimant are evaluated under Jordan's Principle.

1. Claimant's information

A. Tell us about the claimant

First name: _____

Last name: _____

Other Name(s): _____

Mailing address: _____

Date of birth: _____

2. Essential Service(s) that the Claimant Needed as a Child

A. Identify one or more specific essential services that the claimant needed when they were a child (Please be specific; for example, if the claimant needed a hospital bed as a child, specify that it was a hospital bed as opposed to "medical equipment". Similarly, if the claimant would have needed or benefitted from Vincristine in relation to childhood leukemia, please specify "Vincristine" as opposed to "anti-cancer medicines". For more information on what constitutes an "essential service", please see the Framework of Essential Services in Schedule A):

a) _____

b) _____

c) _____

d) _____

B. Explain how the claimant may/would have benefitted from the service(s) as a child and how the receipt of the service(s) 'is associated with'[2] the way in which the claimant currently functions in, and experiences, their social world:

_____
_____
_____
_____
_____

[2] The distinction between 'associated with' and 'has had an impact on' is an important distinction. Drawing a causal link between not having received a service or support and a person's functioning as an adult is not possible, as there are other factors that inform a person's current level of function. An 'association' implies that the event during childhood and a person's current level of function co-exist.

_____

_____

C. At approximately what age or age range would the claimant have benefitted from the essential service(s)?

Age: _____ or

Age Range:

- 0-3
- 3-6
- 6-9
- 9-12
- 12-15
- 15-adulthood

C. Specify the claimant's diagnosis/diagnoses, if applicable:

_____

_____

_____

_____

3. The Claimant's Level of Need

A. In what area would the claimant have benefitted from an essential service(s) as a child? (please check all that apply):

- Seeing
- Hearing
- Mobility
- Communication
- Dexterity
- Pain-related
- Learning
- Developmental

- ☐ Mental health-related
- ☐ Other: _____

B. How significant is/was the claimant's difficulty associated with the limitation or impairment for which the claimant needed the essential service(s). (You are *not* required in this form to ascertain that the delay, denial, unavailability or inaccessibility of an essential service *caused* the difficulty experienced by the claimant)?

- ☐ No difficulty
- ☐ Some difficulty
- ☐ A lot of difficulty
- ☐ Function is or was impossible

4. Professional's Information

Name: _____

Last name: _____

Medical license, other certification or registration number (if applicable): _____

Telephone number: _____

Address: _____

A. What is the claimant's relationship to you (for example, patient)? _____

B. How long have you known the claimant? _____

C. Do you have medical or other information on file relating to the above matters that you have certified on this form? Yes / No

D. Select the professional type that applies to you (check all that apply)[3]:

- ☐ Aboriginal Disability Case Manager
- ☐ Assistive Technologist

[3] Terminologies used to describe professions may represent historical terminology that may be outdated. No disrespect is intended. We have no intention to impose specific terminology (e.g., Indigenous vs. First Nations vs. Aboriginal).

- Audiologist
- Behavioural Consultant/Analysts
- Chiropractor
- Community Health Nurse
- Community Health Representative
- Counselling Services
- Dentist
- Early Childhood Learning and Care and Intervention (e.g., Early Childhood Interventionist/Educator, Aboriginal Headstart)
- Educational Professional
- Elder or Knowledge Keeper designated as such by your community
- Mental Health Professional (e.g., mental health nurse)
- Mental Health Therapist
- Midwife/Doula
- Neuropsychologist
- Nurse/ Nurse Practitioner
- Occupational Therapist
- Ophthalmologist
- Optometrist
- Orthodontist
- Otolaryngologist
- Pediatrician
- Physical Therapist
- Physician/Doctor
- Physiotherapist

- ☐ Psychiatrist
- ☐ Psychological Associate
- ☐ Psychologist (Clinical/Social/Educational)
- ☐ Psychotherapist
- ☐ Recreational Therapist
- ☐ Speech-Language Pathologist
- ☐ Social Worker
- ☐ Substance Use Professional (e.g., National Native Alcohol and Drug Abuse Program (NNADAP) worker)
- ☐ Other: _____

Professional's Signature: _____

Date: _____

JORDAN'S PRINCIPLE DRAFT IMPACT ASSESSMENT QUESTIONNAIRE

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
1. **If you are filling this out on behalf of a child's estate, did the claimant pass away from a condition related to the essential service you have identified?** (Y/N) *For example, if a child endured chronic kidney disease and failed to receive appropriate diagnostic or dialysis treatment, check this box.*						Yes	N	Will automatically place in "significant impact" ($40k+) category.
IMPACTS AT TIME OF DENIAL								
2. **Did you have to leave your community to access the essential service that you have identified? (Y/N)**							Y/N	This is a threshold question. The subsequent three questions are only presented if the individual answers Yes.

Question		Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(a)	If yes, was your relocation temporary or permanent to obtain an essential service you have identified?	1-2 Days (temporary)	1 week (temporary)	1 Month (temporary)	1 Month to 1 Year (Temporary-Semi-Permanent)	More than 1 year, but less than 2 years) Semi-Permanent	More than 2 years (Permanent)		
3.	**When looking back on the time that you needed the essential service:**								
(a)	To what extent did the delay or lack of essential service have on your sense of meaning? (e.g., mental ability to learn and understand)	Limited impact I was able to learn and understand without notable impact.	Some impact Some days I was not able to learn and understand without this essential service. On other days this did not impact my ability to learn and understand.	More impact This continually impacted upon my ability to learn and understand.	Most impact I was not able to learn and understand without this essential service.				From Thunderbird Framework: **meaning** (mental behaviour, expressed through intuition, understanding and rationale) Examples: learning and knowing one's culture, spirituality, access to resources to learn about culture, spirit, traditions, ceremony), etc.

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(i) How long did this impact upon your sense of meaning? (e.g., your mental ability to learn and understand)	Limited impact This impacted upon me for less than 1 month.	Some impact This impacted upon me for more than 1 month, but less than [•] months	More impact This impacted upon me for more than [•] months, but less than [•] years	Most impact This impacted upon me from the time I required this essential service throughout my childhood.				
(b) To what extent did the delay or lack of essential service impact your sense of purpose? (e.g., your physical ability to participate in educational and recreational activities)	Limited impact I was physically able to participate in educational and recreational activities without notable impact.	Some impact Some days I was not able to physically able to participate in educational and recreational activities without this essential service. On other days this did not impact my physical ability to participate in education and recreational activities.	More impact This continually impacted upon physical ability to participate in educational and recreational activities.	Most impact I was physically not able to participate in educational and recreational activities without this essential service.				From Thunderbird Framework: **Purpose** (physical behaviour expressed through wholeness and way of being) Examples: having access to and participating in spiritual practices such as naming, clan identity, sacred medicines, rights of passage for one's nation (e.g., at puberty, fasting), etc.

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(i) How long did this impact upon your sense of purpose? (e.g., physical ability to participate in education and recreational activities)	Limited impact This impacted upon me for less than 1 month.	Some impact This impacted upon me for more than 1 month, but less than [•] months	More impact This impacted upon me for more than [•] months, but less than [•] years	Most impact This impacted upon me from the time I required this essential service throughout my childhood.				
(c) To what extent did the delay or lack of essential service impact your sense of hope? (e.g., ability to participate in cultural activities, connect with culture or spirituality)	Limited impact I was able to participate in cultural activities and connect with culture and spirituality without notable impact.	Some impact Some days I was not able to participate in cultural activities and connect with culture and spirituality without this essential service. On other days this did not impact my ability to participate in cultural activities and connect with culture and spirituality.	More impact This continually impacted upon ability to participate in cultural activities and connect with culture and spirituality.	Most impact I was not able to participate in cultural activities and connect with culture and spirituality without this essential service.				From Thunderbird Framework: **Hope** (spiritual behaviour, expressed through belief and identity) Examples: knowledge of the original language of one's nation, knowing one's spirit name, knowing one's clan, knowing one's nation, knowing names of one's ancestors and generations, etc.

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(i) How long did this impact upon your sense of hope? (e.g., ability to participate in cultural activities, connect with culture or spirituality)	Limited impact This impacted upon me for less than 1 month.	Some impact This impacted upon me for more than 1 month, but less than [•] months	More impact This impacted upon me for more than [•] months, but less than [•] years	Most impact This impacted upon me from the time I required this essential service throughout my childhood.				
(d) To what extent did the delay or lack of essential service impact your sense of belonging? (e.g., relationships with your family or community)	Limited impact I was able to create and maintain my relationships with my family and community without notable impact.	Some impact Some days I was not able to create or maintain my relationships with my family and community without this essential service. On other days this did not impact my ability to create and maintain my relationships with my family and community.	More impact This continually impacted upon my ability to create and maintain my relationships with my family and community.	Most impact I was not able to create and maintain my relationships with my family and community without this essential service.				From Thunderbird Framework: **Belonging** (emotional behaviour, expressed through attitude and relationship) Examples: connections and relationships to the land, culture, family, community one comes from, etc.

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(i) How long did this impact upon your sense of belonging? (e.g., relationships with your family or community)	Limited impact This impacted upon me for less than 1 month.	Some impact This impacted upon me for more than 1 month, but less than [•] months	More impact This impacted upon me for more than [•] months, but less than [•] years	Most impact This impacted upon me from the time I required this essential service throughout my childhood.				
IMPACTS IN CURRENT CIRCUMSTANCES								
4. **In your life now, do you have difficulty with one of the following?** **If so, how does this impact upon your ability to engage with your community currently?**							Y/N	
(a) I have trouble seeing.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	

Question		Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(b)	I have trouble hearing.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	
(c)	I have trouble moving around or using my hands or fingers.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	
(d)	I have trouble learning or remembering.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	
(e)	I have trouble with my mental health.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	
(f)	I have trouble understanding people and sharing what I am thinking or feeling.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	

Question	Category 1	Category 2	Category 3	Category 4	Category 5	Category 6	Y/N	NOTES
(g) I have a developmental condition, disability or disorder.	Does not notably impact my current life.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to my difficulties in this area.			N	
5. What is the current impact of the delay or lack of essential service on your relationships with your culture, land, family and community?	Does not currently have a notable impact.	Impacts my life some days, but on other days it does not.	Continually impacts my life on a daily basis.	Cannot engage in certain aspects of daily life due to the impact upon my relationships with my culture, land, family and community.			N

AFFIDAVIT OF WILLIAM COLISH
(Affirmed September 2, 2022)

I, William Colish, in the City of Montreal in the Province of Quebec, SOLEMNLY AFFIRM:

1. I am a lawyer at Kugler Kandestin LLP, co-counsel for the plaintiffs and class counsel, and as such I have knowledge of the matters hereinafter deposed to, either personally or from having been advised by others, and where so stated I believe same to be true. In affirming this affidavit, I do not intend to waive any solicitor-client, settlement or other privilege.

A. OVERVIEW

2. As lawyers, it is our job to advance the case towards a trial. At any point in time, a defendant may approach us with a view to exploring the possibility of settlement. In this case, we attended mediation and then intensive negotiations outside of mediation, while working on a parallel track to advance the case if the negotiations did not result in a settlement.

3. Over a long period of time, the parties had countless in-person and virtual meetings to discuss numerous aspects of a potential settlement and to negotiate myriad terms. The discussions allowed all parties to voice their views on a variety of challenging and emotionally charged subjects.

4. While the discussions that took place during the mediation or negotiations are protected by settlement privilege, the duration of the negotiations and the great number of meetings provide a clear indication of just how challenging it was for the parties to arrive at a settlement satisfactory to their respective clients.

5. At the end of any negotiation, the plaintiffs are presented with the absolute final offer of its adversary. At that point in time, it is up to counsel to the plaintiff to make a recommendation to the clients regarding whether to accept the offer or to refuse the offer and simply proceed to trial, which may not occur for many years.

6. In this particular case, when class counsel was satisfied that it had been presented with Canada's absolute final offer, our team had numerous discussions with the representative plaintiffs. All of class counsel and all of the plaintiffs believed, and continue to believe, that we have achieved an excellent settlement; one that will allow hundreds of thousands of vulnerable individuals to receive life-changing compensation by following a claims process that will not be adversarial and that will be as minimally invasive as possible.

7. There is no such thing as a perfect settlement. In order to get absolutely everything that one claims in the legal proceedings, it is necessary to proceed to trial and obtain a final judgment. A settlement entails compromise, and it is incumbent on the plaintiffs, guided by class counsel, to decide whether the settlement is acceptable. In this case, class counsel acknowledges that certain compromises have been made; these compromises, while difficult, have been made in order to further the guiding principle of favouring the interests of the children.

8. Class counsel believe that this settlement is an outstanding result. We have no hesitation in recommending its approval to the Court.

9. In this affidavit, I provide details on the litigation, the settlement and the lengthy negotiations that led to the largest settlement in Canadian history.

B. THE CLASS COUNSEL TEAM

10. The Court has appointed Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin LLP as class counsel.

11. Although the litigation has been advanced in unison, two different groups of lawyers act for two groups of plaintiffs. Sotos LLP, Kugler Kandestin LLP, and Miller Titerle + Co. act for Xavier Moushoom, Jeremy Meawasige (by his litigation guardian, Jonavon Joseph Meawasige), Jonavon Joseph Meawasige, and Zacheus Joseph Trout.

12. Nahwegahbow Corbiere and Fasken Martineau Dumoulin LLP act for the Assembly of First Nations ("**AFN**"), Ashley Dawn Louise Bach, Karen Osachoff, Melissa Walterson, Noah Buffalo-Jackson by his Litigation Guardian, Carolyn Buffalo, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson.

C. CHRONOLOGY OF THE LITIGATION

a. The Federal Court Class Proceedings

13. Xavier Moushoom commenced a proposed class action (Court File No. T-402-19) on March 4, 2019, seeking compensation for children who suffered discrimination related to Canada's First Nations Child and Family Services ("**FNCFS**") and the discriminatory application of Jordan's Principle ("**Moushoom Class Action**"). Later, Jeremy Meawasige by his Litigation Guardian, Jonavon Joseph Meawasige, and Jonavon Joseph Meawasige were added as plaintiffs. The class period was defined to begin on April 1, 1991.

14. On January 28, 2020, the AFN and some proposed representative plaintiffs filed a proposed class action (Court File No. T-141-20) in the Federal Court about the same subject matter ("**AFN Class Action**"). The proposed representative plaintiffs in the AFN Class Action were later amended to be Ashley Dawn Louise Bach, Karen Osachoff, Melissa Walterson, Noah Buffalo-Jackson by his Litigation Guardian, Carolyn Buffalo, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson.

15. In 2020, the two groups of plaintiffs agreed to consolidate the Moushoom Class Action and the AFN Class Action. The claims were formally consolidated on July 7, 2021 by Madam Justice St-Louis (collectively the "**Consolidated Class Action**").

16. For reasons further described below, Madam Justice St-Louis also ordered that a group of class members with claims relating to delays, denials or gaps in essential services be separately prosecuted, granting leave to Zacheus Joseph Trout and the AFN to commence that action. Attached hereto as **Exhibit "A"** is a copy of that order.

17. Mr. Trout and the AFN therefore commenced Court File No. T-1120-21 ("**Trout Action**") on July 16, 2021. Mr. Trout sought to represent class members who had faced a delay, denial or gap in the receipt of an essential service for which the class members had a confirmed need between April 1, 1991 and December 11, 2007.

18. Madam Justice Aylen certified the Consolidated Class Action on consent on November 26, 2021. Attached as **Exhibit "B"** is the certification order of the Consolidated Class Action.

19. Madam Justice Aylen certified the Trout Action on consent on February 11, 2022. Attached as **Exhibit "C"** is the certification order of the Trout Action.

20. The AFN is a plaintiff in both the Consolidated Action and the Trout Action, while the Court has appointed the individual plaintiffs as representative plaintiffs in its respective certification orders.

b. Canadian Human Rights Tribunal Proceeding

21. The Consolidated Class Action partly overlaps with a proceeding before the Canadian Human Rights Tribunal ("**Tribunal**"), where the AFN is a co-complainant. In 2007, the AFN and the First Nations Child and Family Caring Society of Canada ("**Caring Society**") filed a complaint with the Canadian Human Rights Commission against Canada. On October 14, 2008, the Canadian Human Rights Commission referred the complaint to the Tribunal.

22. The Tribunal rendered its decision on the merits of the complaint on January 26, 2016: *First Nations Child and Family Caring Society of Canada et al. v. Attorney General of Canada (for the Minister of Indian and Northern Affairs Canada)*, 2016 CHRT 2. The Tribunal found that Canada had discriminated against First Nations children and families on reserves and in the Yukon by its underfunding of child and family services under the FNCFS program and by Canada's prohibitively restrictive interpretation of Jordan's Principle.

23. The Tribunal later decided in *First Nations Child & Family Caring Society of Canada et al. v. Attorney General of Canada (representing the Minister of Indigenous*

and Northern Affairs Canada), 2019 CHRT 39, that the First Nations children and their caregiving parents and grandparents should receive human rights compensation ("**Compensation Decision**"). The Tribunal subsequently clarified and expanded on the Compensation Decision in several related decisions. The Compensation Decision related to removed children between 2006 and 2022, and Jordan's Principle children between 2007 and 2017.

D. SETTLEMENT PROCESS

a. Negotiations and Mediation

24. The parties to the Moushoom Class Action had some exploratory settlement discussions with Canada in 2019. At that time, class counsel in the Moushoom Class Action retained Professor Nico Trocmé, Director of the School of Social Work at McGill University, to work with actuary, Peter Gorham, to estimate the size of the Removed Child Class. I provide more details on this expert work below.

25. Beginning on November 22, 2020, the plaintiffs in the Consolidated Class Action and the Caring Society engaged in a mediation with Canada in accordance with the Federal Court Guidelines for Aboriginal Law Proceedings. Retired First Nations Federal Court judge, the Honourable Leonard Mandamin, was appointed as mediator.

26. The mediation covered the Consolidated Class Action, the Compensation Decision, and the long-term reform of the FNCFS program and Jordan's Principle. The negotiations proceeded through two separate "tables", one focussing on compensation and the other on long-term reform.

27. At that time, Canada refused to negotiate the Trout Action. That refusal was the reason for the bifurcation of the Trout Action from the Consolidated Class Action. Therefore, the Trout Action did not form part of the mediation with the Honourable Mr. Mandamin. The parties proceeded toward a contested certification motion of the Trout Action, with the Court setting a timetable and scheduling September 19, 2022 as the starting date for that hearing. The plaintiffs prepared and served their certification motion record.

28. The Honourable Mr. Mandamin directed that the representative plaintiffs be permitted to attend the mediation to share their experiences, views and expectations with the negotiators. As a result, all representative plaintiffs (except for Mr. Trout) who wished to share their story and expectations participated extensively in the mediation.

29. The mediation continued for nearly one year, until September 2021. During this time, the mediation sessions occurred regularly, and often for consecutive sessions within the same week. However, despite the significant efforts on all sides, the parties were not able to reach an agreement.

30. Beginning in early November 2021, the parties engaged in intensive settlement discussions facilitated by the Honourable Murray Sinclair. These negotiations also included the Trout Action, and strived for a global settlement of all litigation. The settlement agreement before the Court is a result of that both the mediation and that round of negotiations. It is addressed in more detail below.

b. Estimated Size of the Class

31. In order to measure the reasonableness of a settlement, the parties sought to estimate the size of each of the classes, which include: the Removed Child Class, the Removed Child Family Class, Jordan's Principle Class, the Jordan's Principle Family Class, the Trout Child Class, and the Trout Family Class.

32. After the Compensation Decision, the Parliamentary Budget Officer issued a report on April 2, 2020, titled "First Nations Child Welfare: Compensation for Removals", which sought to estimate the number of removed children and families covered by the Compensation Decision. Attached as **Exhibit "D"** is that report. The report estimated the total number of children and parents and their corresponding Tribunal compensation would be as follows:

> The preliminary estimate of Indigenous Services Canada (ISC) was that 125,600 people are eligible for compensation totalling $5.4 billion. Based on the PBO's assumed legal interpretation, the PBO estimates that 19,000 to 65,100 people are eligible for compensation in a range of $0.9 billion to $2.9 billion.

33. In the parties' negotiations, the expert opinion produced by Professor Trocmé and Mr. Gorham laid the foundation for the parties' estimate of the size of the Removed Child Class. The experts had used data available within Indigenous Services Canada ("**ISC**") relating to the child removals funded by ISC during the class period to arrive at their estimate of the size of the class. The purpose of this report was to assist the parties in their negotiations by providing estimates of the number of First Nations children who were ordinarily resident on reserve and who were taken into care in Canada during the class period and remained in care for specific timeframes. Professor

Trocmé and Mr. Gorham provided a report on January 18, 2021. Attached as **Exhibit "E"** is that report.

34. Given that the ISC data contained gaps and inaccuracies, the experts applied some assumptions and corrected inaccuracies such as duplications to reach their opinion on the estimated size of the Removed Child Class between 1991 and 2019.

35. The parties subsequently asked Professor Trocmé and Mr. Gorham to update their estimate until March 31, 2022, the date as of which the parties agreed that the compensation time period would end. Mr. Gorham delivered a letter on February 7, 2022, updating the class size estimate. Attached as **Exhibit "F"** is that letter, which estimated that 116,000 Removed Child Class members existed.

36. I am informed by my co-counsel, Mohsen Seddigh, and do verily believe that direct data did not exist on the size of the Removed Child Family Class because this information was not systemically captured by the ISC data on the removed children in the FNCFS program. A subsequent report by the Office of the Parliamentary Budget Officer dated February 23, 2021 and titled "Compensation for the Delay and Denial of Services to First Nations Children" estimated: "First Nations children live with an average of 1.5 biological parents (or grandparents if parents are absent)" ("**Parliamentary Report**"). Attached as **Exhibit "G"** is that report.

37. On that basis, the size of the Removed Child Family Class could be calculated by multiplying the estimated size of the Removed Child Class by 1.5, which would yield 174,000. However, that raw number may not be accurate because it does not take

into account the Removed Child Class members who had the same parents, *i.e.* some parents having more than a single child.

38. Estimating the number of the Jordan's Principle Class and the Trout Child Class has been a challenge due, amongst others, to the following factors:

(a) The way in which Jordan's Principle was applied by the Federal Government has evolved from its inception in 2005 in *Wen:De: We are Coming to the Light of Day* and its first official acknowledgement in a 2007 House of Commons resolution, through the Tribunal's 2016 decision, and in the subsequent jurisprudence of the Tribunal. Attached as **Exhibit "H"** is *Wen:De: We are Coming to the Light of Day*, and attached as **Exhibit "I"** is the December 12, 2007 House of Commons Motion 296. At first, the Jordan's Principle service delivery program addressed inter-governmental disputes between the federal and provincial governments in situations where an on-reserve child had multiple disabilities (health related). This evolved to eliminating the requirement that the First Nations child on-reserve must have multiple disabilities that require multiple service providers (health and mental health) and applied to all jurisdictional disputes, including those between federal government departments. Jordan's Principle has since continued to evolve into a child-first principle that applies equally to all First Nations children, whether resident on or off reserve, and includes additional services beyond health and mental health (such as education, housing, etc.). Given this evolution and the varying service standards, it is difficult to determine the class size using today's

definition and coverage of Jordan's Principle and applying it across the class period, i.e., going back to 1991.

(b) Data relating to instances of confirmed needs for an essential service, delays, denials or service gaps from 1991 until 2016 is scarce or non-existent. As the Parliamentary Report stated: "The number of children who were affected by delays and denials of essential services is highly uncertain because Jordan's Principle claims were not tracked prior to 2017."

(c) The concept of "Jordan's Principle" did not exist at all during most of the Trout Child class period (*i.e.*, until 2005) and, although class counsel maintained and prevailed in convincing Canada that the underlying constitutionally protected equality rights of that class existed and were breached, no specific heading exists under which the relevant data could have been kept.

39. The Parliamentary Report estimated the size of the Jordan's Principle Class as follows: "In total, about 13,000 children are expected to be eligible for compensation, mostly in relation to delayed approval of group claims. A further 90,000 children affected by essential service gaps are assumed not to be eligible but would be eligible under the interpretation apparently assumed by parties to the CHRT proceeding". I am told by Mr. Seddigh, and do verily believe that the Parliamentary Report's estimates appear to be based on extrapolating the group requests delayed between June 2017 and November 2017 to the 2007-2017 period. The actual individual requests only amounted

to about 200 delayed claims. The denied claims were a much smaller number, in the dozens. The Parliamentary Report estimated service gaps to be the largest group.

40. Given that these proceedings sought damages for individuals, rather than groups, the parties did not find the Parliamentary Report's estimated Jordan's Principle class size to be a reliable indicator.

41. Canada provided estimates of 58,385 and 69,728 class members for the period from December 12, 2007 to November 2, 2017. These Jordan's Principle Class estimates were based on the number of Jordan's Principle service requests in the fourth fiscal quarter of the 2019-2020 fiscal year (*i.e.*, January 1, 2020 to March 31, 2020) from "GCCase", which is the case management system that the Government of Canada employs for Jordan's Principle tracking. The data from this quarter was used as a sample to estimate the number of eligible claimants under the Jordan's Principle Class by multiplying the number of individual requests from that period for the cohort of 2007 to 2017.

42. This method of estimation was chosen because prior to December 2019, Canada did not have a coordinated way of collecting and managing Jordan's Principle data. In December 2019, Canada completed its roll-out of GCCase. The period from January 1, 2020 to March 31, 2020 is the first fiscal quarter that GCCase was used in ISC's Jordan's Principle program.

43. Class counsel were informed by Canada that later data from 2020 was significantly impacted by the COVID-19 pandemic, which created an influx in requests

for supports. The data extracted for these estimates excludes COVID-19 related Jordan's Principle requests, which would not have existed during the class period.

44. This estimate does not account for duplication in requests (*i.e.*, a single child with multiple, separate requests) or overlap between group and individual requests. To address the potential for overlap, the estimate provided a range of three scenarios that made assumptions of 0% overlap, 20% overlap and 50% overlap, which is useful to understand the total range of possible numbers of children who may be eligible for compensation. The median 20% would yield an estimated Jordan's Principle Class size of 65,000.

45. The Trout Child Class size is similarly difficult to approximate. The Trout Child Class size was estimated by taking the 65,000 median estimate for the Jordan's Principle class and multiplying it by the number of years that the Trout Child Class period is greater than the Jordan's Principle Class period (a multiple of 1.6). This results in an estimated Trout Child Class size of 104,000.

46. A unique reality regarding the Jordan's Principle Class and Trout Child Class is that the detailed criteria for inclusion in those classes for compensation purposes were not fully developed in the Tribunal or these Federal Court proceedings. It is therefore not possible to say with certainty who would and who would not have qualified as a Jordan's Principle claimant under the Tribunal proceeding, except for the rare instances where a finding exists about an individual's Jordan's Principle equality rights having been breached, such as the representative plaintiff, Jeremy Joseph Meawasige (2013 FC 342).

47. The proposed settlement agreement leaves those eligibility details to be determined by the plaintiffs through a process that is subject to the Court's approval. These criteria include factors such as the level of impact that is to be deemed compensable, the types of services that can be considered "essential" for compensation purposes, and the documentation required to substantiate a claim. The more relaxed the criteria, the larger the number of individuals who may qualify for compensation under this settlement (and, therefore, the larger the size of the class), and vice versa.

48. Finally, ISC commissioned a report by experts at the University of Toronto and McGill to assess the existing data and how it could be employed for the purposes of removed children and Jordan's Principle compensation under the Compensation Decision. On February 2022, the experts issued a report titled "Review of Data and Process Considerations for Compensation Under 2019 CHRT 39", highlighting a number of issues that included data gaps for child welfare and Jordan's Principle compensation. The report also provided recommendations for supports to claimants and processing claims. The report is attached to my affidavit as **Exhibit "J"**.

c. Agreement in Principle and Final Settlement Agreement

49. On December 31, 2021, the parties executed an agreement in principle for a global settlement of the litigation in return for $20 billion ("**AIP**"). (The AIP is separate from the long-term reform aspect of the negotiations where another agreement in principle was concurrently reached, which included an additional $19.807 billion for the long-term reform of the FNCFS and Jordan's Principle programs.)

50. After signing the AIP, the parties engaged in six more months of intensive negotiations, which included numerous remote and in-person multi-party meetings, to draft a final settlement agreement ("**FSA**"). The parties adopted a respectful negotiation process that allowed them to develop and voice their positions.

51. The plaintiffs agreed on a series of objectives, which guided the negotiations and have now become governing principles of the FSA. These principles aimed to:

(a) maintain and, where appropriate, increase the awards under the Compensation Decision to the greatest extent possible;

(b) ensure proportionality of compensation based on objective factors serving as proxies for harm;

(c) ensure that where compromise was required, it would favour the children who suffered;

(d) ensure a trauma-informed and culturally sensitive process;

(e) avoid any need for interview or cross-examination of survivors to minimize re-traumatization;

(f) create an accessible claims process:

(g) provide significant supports throughout the claims process; and

(h) ensure all settlement funds are directed to survivors and their families.

52. The parties signed the FSA on June 30, 2022. Attached as **Exhibit "K"** is the FSA.

E. FINAL SETTLEMENT AGREEMENT

53. Under the FSA, Canada agreed to pay $20 billion in compensation. This figure is over four times the amount of total compensation distributed to claimants under the Indian Residential Schools Settlement Agreement ("**IRSSA**") and would make this the largest class action settlement in Canadian history. The IRSSA, by way of reference, provided $1.622 billion in base compensation, $57 million is personal education credits and an additional $3.233 billion for enhanced compensation pursuant to the Independent Assessment Process. Attached as **Exhibit "L"** are statistical reports on the IRSSA.

54. The FSA covers for the following classes:

(a) the Removed Child Class and their relevant families;

(b) the Jordan's Principle Class and their relevant families; and

(c) the Trout Child Class and their relevant families.

55. The Removed Child Class under the FSA includes First Nations individuals who, at any time during the period between April 1, 1991 and March 31, 2022, while they were under the age of majority, were removed from their home by child welfare authorities or voluntarily placed into care, and whose placement was funded by ISC.

Generally, ISC funded removals of children living on-reserve or one of whose parents was ordinarily resident on-reserve.

56. The Removed Child Family Class in the certification order covers all persons who are the brother, sister, mother, father, grandmother or grandfather of a member of the Removed Child Class at the time of removal. However, under the FSA, only the caregiving parent(s) and caregiving grandparent(s) of the Removed Child Class are eligible to receive direct compensation. Such parents include biological, adoptive or common law, but excludes foster parents. Other family class members (*i.e.*, siblings and non-caregiving parents or grandparents) may be entitled to indirect benefits through the Cy-près Fund further described below.

57. With respect to Jordan's Principle, the FSA defines the class as all First Nations individuals who, during the period between December 12, 2007 and November 2, 2017, did not receive from Canada, whether by reason of a denial or a service gap, an essential service relating to a confirmed need, or whose receipt of said essential service relating to a confirmed need was delayed by Canada, on grounds including but not limited to lack of funding, lack of jurisdiction, a jurisdictional dispute with another government or governmental department, while they were under the age of majority. November 2, 2017 is the date as of which the Tribunal found on consent of the parties to that proceeding that Canada no longer discriminated in its implementation of Jordan's Principle (2017 CHRT 35).

58. The Jordan's Principle Family Class in the certification order includes all persons who are the brother, sister, mother, father, grandmother or grandfather of a

member of the Jordan's Principle Class at the time of delay, denial or service gap. Amongst the Jordan's Principle Family Class, however, only some or all of their caregiving parents or caregiving grandparents may be eligible to receive direct compensation under the FSA. Other family class members (*i.e.*, siblings and non-caregiving parents or grandparents) may be entitled to indirect benefits through the Cy-près Fund further described below.

59. The Trout Child Class under the FSA includes First Nations individuals who, during the period between April 1, 1991 and December 11, 2007, while they were under the age of majority, did not receive from Canada an essential service relating to a confirmed need, or whose receipt of said essential service was delayed by Canada, on grounds, including but not limited to, lack of funding, lack of jurisdiction, or as a result of a service gap or jurisdictional dispute with another government or governmental department.

60. The Trout Family Class under the certification order includes all persons who are the brother, sister, mother, father, grandmother or grandfather of a member of the Trout Child Class at the time of delay, denial or service gap. Amongst the Trout Family Class, however, only the caregiving parents or caregiving grandparents may receive direct compensation if otherwise eligible under the FSA. Other family class members (*i.e.*, siblings and non-caregiving parents or grandparents) may be entitled to indirect benefits through the Cy-près Fund further described below.

61. The term "First Nations" has been defined broadly, while making some necessary distinctions amongst the various classes, as follows:

"**First Nations**" means:

(a) with respect to the Removed Child Class, Jordan's Principle Class, Trout Child Class, and Stepparents: individuals who are registered pursuant to the *Indian Act*;

(b) with respect to the Removed Child Class, Jordan's Principle Class, and Trout Child Class: individuals who were entitled to be registered under sections 6(1) or 6(2) of the *Indian Act*, as it read as of February 11, 2022 (the latter date of the Certification Orders);

(c) with respect to the Removed Child Class: individuals who met Band membership requirements under sections 10-12 of the *Indian Act* by February 11, 2022 (the latter date of the Certification Orders) such as where their respective First Nation community assumed control of its own membership by establishing membership rules and the individuals were found to meet the requirements under those membership rules and were included on the Band List;

(d) with respect to the Jordan's Principle Class only: individuals who met Band membership requirements under sections 10-12 of the *Indian Act* pursuant to paragraph (c), above, AND who suffered a Delay, Denial, or Service Gap between January 26, 2016 and November 2, 2017;

(e) with respect to the Jordan's Principle Class only: individuals who were recognized as citizens or members of their respective First Nation by February 11, 2022 (the latter date of the Certification Orders) as confirmed by First Nations Council Confirmation, whether under final agreement, self-government agreement, treaties or First Nations' customs, traditions and laws, AND who suffered a Delay, Denial, or Service Gap between January 26, 2016 and November 2, 2017.

F. CLASS BUDGETS AND ESTIMATED PAYOUTS

62. The FSA provides payouts to potentially hundreds of thousands of class members, while some groups, such as siblings and non-caregiving parents, may only benefit from the FSA indirectly. This differing approach to different classes follows

the proportionality and fairness principle that guided the negotiations leading up to the FSA, and the drafting of the FSA. Under this approach, which the First Nations representative plaintiffs have strongly advocated for, compensation should be proportionate to the impact on the individual, and it is inappropriate to treat all class members the same or dilute the settlement funds amongst an overly broad group.

63. In the following parts, I describe the budget allocated to each class and the payouts expected to be made available to class members.

a. Removed Child Class Budget and Compensation

64. The FSA allocates a budget of $7.25 billion to the Removed Child Class.

65. Each Approved Removed Child Class Member will be entitled to receive a "Base Compensation" of $40,000. The Base Compensation payable to an Approved Removed Child Class Member will be grounded in the fact of removal.

66. In addition to the base compensation, the plaintiffs were of the view that several relevant factors needed to be included in the compensation scheme to ensure that those who suffered greater impact would be entitled to larger compensation.

67. The enhancement factors are proxy measures of harm that are objective and can be ascertained from an individual's child and family services records and thus would minimize individual testimony or additional documentation, in alignment with the principle of non-traumatization. These enhancement factors were chosen following consultation with experts. The enhancement factors include:

(a) **Age at removal:** This enhancement factor recognizes that First Nations children who are removed from their families at birth or during infancy are deprived of a crucial developmental stage for bonding to the parent(s) or caregiver(s), which can result in long-term impacts to an individual's wellbeing, along with increased risk of recurring involvement in child and family services and youth justice. This factor was specifically responsive to a concern expressed by the Caring Society.

(b) **Time spent in care:** This enhancement factor acknowledges that the longer a child stays in care, the less likely they are to exit care permanently. This factor is also related to more frequent moves, higher likelihood of recurring involvement with child and family services, adverse impacts on child/youth mental wellness, and greater cultural alienation.

(c) **Age when exiting care:** This enhancement factor recognizes the adverse, systemic barriers that First Nations youth who age out of care (*i.e.*, reach the age of majority while in care) often experience. The FNCFS did not support youth to navigate independent living once they exit care. These youth are subsequently at an increased risk to experience homelessness, poverty, employment insecurity, involvement with the justice system, and long-term mental wellness challenges.

(d) **Removal for the purpose of receiving an essential service:** This enhancement factor acknowledges that First Nations children who were removed from their families in order to access an essential service were doubly discriminated against by Canada's failure to properly implement

Jordan's Principle and the underfunding of the FNCFS. It further acknowledges the risks inherent to being involved in child and family services.

(e) **Removal from a northern or remote community:** This factor acknowledges that First Nations children removed from northern and/or remote communities are at a high risk of losing connection to their families, culture, languages, and communities due to the challenges associated with returning home. Child and family services literature demonstrates that children who lack access to family, language, and culture are at greater risk of adverse outcomes for their holistic wellbeing.

(f) **Spells in care and/or number of placements:** This enhancement factor recognizes the long-term negative effect that frequent or recurring placements or moves in care can have on a child's wellbeing due to an environment of instability.

68. The plaintiffs have not yet allocated values to each of these enhancements. The plaintiffs are in the process of designing a system of weighting the Removed Child Enhancement Factors for the Removed Child Class, which will be guided by input from experts. This will be the subject of further submissions on the motion scheduled for December 2022 for the approval of the Claims Process.

69. The FSA does not determine the weight given to an enhancement factor and the number of eligible factors. However, the plaintiffs intend to retain Professor Trocmé and Mr. Gorham to develop the methodology for determining same in the following fashion:

(a) First, the relative weight of each enhancement factor will be assigned a percentage of the $2.65 billion set aside for enhancement factors based on the Trocmé/Gorham class size estimate; and

(b) Second, once it is possible to know or forecast the number of class members who are eligible to receive that enhancement factor, then a dollar figure may be assigned to it, with the assistance of an actuarial firm retained by the parties.

70. As an example, the time-in-care factor illustrates the current methodology that is being considered and how it may be applied. The experts may, for example, determine that 20% of the $2.65 billion should be set aside for the time-in-care enhancement factor, given its importance as a proxy for harm relative to the other factors. If greater harm results from a longer time in care, the enhancement factor may be scaled to reflect this fact. The enhancement payments could be allotted according to the following categories or levels: 1 to 3 years in care will benefit from the first enhancement amount or level; 3 to 6 years in care will benefit from the second enhancement amount, which shall be double the first enhancement amount; more than 6 years in care will benefit from the third enhancement amount, which shall be triple the first enhancement amount. The following table shows how these enhancements could translate into dollar figures:

Time in care	**Number of individuals**		**Amount of increase per claimant**
1 up to 3 years	26638	$	6,000.00
3 up to 6 years	11695	$	12,000.00
6 years or more	12778	$	18,000.00
Total		$	530,169,491.53

Percentage of 2.65 billion set aside for enhancement payments	20%

71. The same design process could occur for each enhancement factor as the information regarding the number of survivors who qualify for a specific enhancement factor is obtained. As approximately half of Removed Child Class members will already have attained the age of majority by the time of the settlement approval hearing, this information is expected to be determinable during the initial claims period of three years. The claims expected during this period should permit actuarial analysis for the purpose of recommending to the Court the value allocated to each enhancement factor.

72. The actual highest amount of payout to the most serious cases will depend on take-up across the Removed Child Class. With that caveat in mind, the highest total payout to individuals could exceed $150,000.

b. Caregiving Parents and Caregiving Grandparents of Removed Child Class

73. The FSA allocates a budget of $5.75 billion to the Removed Child Family Class.

74. Amongst the Removed Child Family Class, only the caregiving parents and caregiving grandparents may receive direct payouts. These terms are defined in the FSA such that the eligibility of the Removed Family Class is tied to the removal of the child from a parent or grandparent who was providing care to the child. In the Tribunal's Compensation Decision some biological caregiving parents or grandparents were entitled to human rights compensation only if their child was placed in care off-

reserve. By contrast, under the FSA the payouts are extended to biological parents and grandparents whose children were placed in care on-reserve (as well as caregiving adoptive and step- parents and grandparents). This represents a significant extension of compensation to these family members.

75. The FSA has budgeted a Base Compensation for each Approved Removed Child Family Class member to be $40,000. This Base Compensation amount may be enhanced up to a maximum of $60,000 if more than one child was removed from a caregiving parent or caregiving grandparent. No Approved Removed Child Family Class Member will receive more than one Base Compensation. Further, the Base Compensation of an Approved Removed Child Family Class Member will not be multiplied based on the number of removals or times in care for a child or the number of children in care. This was a necessary restriction on the Compensation decision aimed at proportionality and also preventing the likely situation that some parents would end up receiving multiple times more compensation than the removed children themselves.

76. A caregiving parent or caregiving grandparent who has committed sexual or serious physical abuse that has resulted in the Removed Child Class member's removal is not eligible for compensation in relation to that child. However, a caregiving parent or caregiving grandparent is not barred from receiving compensation if they are otherwise eligible for compensation as a member of another class defined under the FSA.

77. The FSA takes into account the situation where the biological parents may not be together and the role of adoptive and stepparents. Given these realities and complexities, the plaintiffs developed a customized eligibility, according to the following priority list:

(a) Category A: Caregiving parents who are biological parents; then

(b) Category B: Caregiving parents who are adoptive parents or stepparents (where they have stood in a parental role for three, prior continuous years at the time of removal), if applicable; then

(c) Category C: Caregiving grandparent(s).

78. This prioritization also prevents children from being caught in potential disputes amongst various parents and grandparents about payment. Such disputes risk traumatizing the child, and fixed priorities based on First Nations experiences and ways of living reduce that re-traumatization risk.

c. Jordan's Principle and Trout Child Class

79. The FSA allocates a budget of $3 billion for the Jordan's Principle Class and $2 billion for the Trout Child Class.

80. As I described earlier, settling on the eligibility criteria for Jordan's Principle and Trout payouts is complicated by Jordan's Principle's evolving definition, uncertainty about class size, and the fact that the FSA and this process are the first instance where the parties have had to grapple with the details of those eligibility

criteria and the compensability threshold for the discrimination against First Nations children.

81. Given the FSA's principle of proportionality, the plaintiffs cannot simply relax eligibility criteria and dilute the budget amongst a very large group of individuals, paying the same small compensation to everyone regardless of the harm that each of them suffered.

82. The FSA applies the same compensation method to both the Jordan's Principle Class and Trout Child Class, while allocating different compensation levels to each of those classes in light of their respective litigation risk assessments, taking into account factors such as limitations and overlap with the Tribunal's Compensation Decision.

83. Because of the overall cap on compensation and the uncertainties surrounding the size of the class, it may not be possible to compensate all individuals in the Jordan's Principle Class and the Trout Child Class with a base payment of $40,000. Accordingly, the FSA establishes mechanisms to ensure that those who suffered less impact in the Jordan's Principle Class will receive up to $40,000, while those who suffered greater harm will receive a minimum of $40,000. These higher levels of impact may include conditions and circumstances such as an illness, disability or impairment. Such impact is to be measured based on objective factors assessed through culturally sensitive claims forms and a questionnaire designed in consultation with experts. The selection of which claimants qualify under this category will be based on objective factors such as the severity of impact on the child and the number of eligible claimants.

84. Once the number of those class members who receive at least $40,000 is determinable, the remaining funds in the Jordan's Principle budget will be shared pro rata among that group. If a surplus exists, those who suffered greater impact may receive enhanced compensation.

85. The same method applies to the Trout Child Class. However, an Approved Trout Child Class Member will receive a minimum of $20,000 in compensation where they have established higher levels of impact than other Trout Child Class members. Those who suffered less impact in the Trout Child Class will receive up to $20,000. Similar to the Jordan's Principle Class, those class members who did not experience significant impacts will be paid that will be determinable once it is known what amounts remain in the budgeted fund following payment to those who were significantly impacted.

86. Payouts under these classes will be determined based on the class members' confirmed need for an essential service if:

(a) a class member's confirmed need was not met because of a denial of a requested essential service;

(b) a class member experienced a delay in the receipt of a requested essential service for which they had a confirmed need; or

(c) a class member's confirmed need was not met because of a service gap even if the essential service was not requested.

87. Supporting documentation will be required as proof of a recommendation by a professional for the treatment, service or equipment. Proof from a professional must specify the essential service, the reason for the need, and when the need existed. The term professional is defined broadly to be responsive to the fact that not all First Nations have easy access to specialists or family physicians, and therefore includes community nurses and other professionals who are available in remote communities.

88. The proposed methodology for the Jordan's Principle and Trout claims process, including the method to distinguish between the individuals who suffered a higher impact and those who suffered a lesser impact, is detailed in other affidavits, sworn concurrently in support of this motion.

d. Jordan's Principle Family Class and Trout Family Class

89. The FSA allocates a fixed budget of $2 billion to this class. There will be no reallocation to these classes of any surpluses or revenues.

90. The FSA provides that only caregiving parents or caregiving grandparents of the Approved Jordan's Principle Class Members and Approved Trout Child Class Members who have established a claim under Article 6.06(11), Article 6.06(12), or Article 6.07(4) may be entitled to compensation. These Articles refer to those class members who experienced the greatest amount of hardship as a result of being deprived of an essential service. Other parents or grandparents will not receive direct payments under the FSA, but may benefit indirectly from the Cy-près Fund.

e. Estates of Deceased Class Members

91. The FSA allows estates of the deceased members of the Removed Child Class, Jordan's Principle Child Class and Trout Child Class to file a claim on behalf of the child.

92. Such claims are eligible for compensation, regardless of whether the child class member passed away prior to or during the claims process.

93. Estates of the family classes will not be eligible for compensation, unless an application for compensation was filed by the member of the family class prior to their death.

94. Learning from past Indigenous settlements, the parties decided that a probate will not be required in most circumstances under the FSA. Thus, payments by estates claimants will follow a priority level of heirs akin to the provisions of the *Indian Act*.

G. CY-PRÈS FUND

95. The FSA creates a First Nations-led Cy-près Fund with an endowment of $50 million from interest earned on the settlement funds. As stated in Article 7.01(2), the intention of the parties in establishing the Cy-près Fund is to benefit class members—such as siblings and non-caregiving parents—who would not be eligible for payouts under the FSA.

96. The objective of the Cy-près Fund is to provide culturally sensitive and trauma-informed supports to the class and contribute towards matters such as the following:

(a) to promote family and community unification, reunification, connection and reconnection for youth in care and formerly in care;

(b) to reduce the costs associated with travel and accommodations to visit community and family, including for First Nations youth in care and formerly in care, support person(s) or family members; and

(c) to facilitate access to culture-based, community-based and healing-based programs, services and activities to class members and the children of First Nations parents who experienced a delay, denial or service gap in the receipt of an essential service.

97. The design of the Cy-près Fund is left to the plaintiffs to be done with the assistance of experts, and will be subject to the Court's approval on a future motion.

H. SUPPORTS AVAILABLE TO CLASS MEMBERS

98. The FSA ensures that culturally appropriate supportive elements exist for claimants.

99. Significant supports, paid for by Canada, are incorporated in the FSA to ensure claimants are able to file their claim and to ensure they have mechanisms for receiving health supports in this process. These supports were the subject of negotiation of a specific group that, starting in February 2022, worked in parallel to the compensation negotiations, comprised of members of the AFN team, along with class counsel and individuals with relevant experience from Canada.

100. These supports will be made available to claimants throughout the claims process of the FSA and are outlined in Article 8 – Supports to Class in Claims Process and in Schedule C - Framework for Supports for Claimants in Compensation Process. The supports include: trauma-informed and culturally appropriate mental health supports; health care professionals to deliver support to class members who suffer or may suffer trauma; assistance to claimants in completing claims forms; enhancing the Hope for Wellness Help Line (which is an Indigenous organization providing 24/7 support to class members experiencing emotional and other trauma through experienced and culturally competent counsellors reachable by telephone and online 'chat'); financial literacy; and investment advice.

101. Canada will also directly pay service providers for mental health and cultural supports and any direct fees charged to claimants to support access to records to support claimant eligibility from provinces, territories, and agencies.

102. Lastly, Canada will also provide the AFN with $2.5 million over 5 years to administer a help desk, employ liaisons to provide claimants with culturally safe assistance and information.

I. FINANCIAL LITERACY AND PROTECTIONS FOR VULNERABLE CLASS MEMBERS

103. The class includes countless vulnerable First Nations youth many of whom are coping with personal and inter-generational trauma.

104. Article 6.11 of the FSA requires the Administrator to ensure that approved class members receive the necessary culturally appropriate financial literacy and investment options to enable them to preserve their compensation. Schedule C - Framework for Supports for Claimants in Compensation Process attached to the FSA also includes financial literacy supports given the heightened need that is expected to exist amongst the class.

105. The plaintiffs will be developing the details of these financial supports and investment options in the Claims Process that will be submitted to the Court for approval in December of this year.

J. NOTICE OF CERTIFICATION AND SETTLEMENT APPROVAL HEARING

106. On June 24, 2022, Madam Justice Aylen approved the short form notice and the long form notice of certification and settlement approval hearing to the class as well as the opt-out form. Attached as **Exhibit "M"** is the Court's said order in English and French, which also attaches the approved notices.

107. The plaintiffs subsequently moved for the approval of the notice plan relating to the notices previously approved. On August 11, 2022, Madam Justice Aylen approved the notice plan and appointed Deloitte LLP as administrator. Attached as **Exhibit "N"** is the Court's said order in English and French, which also attaches the approved notice plan.

108. Concurrently with notice publication, the parties were communicating with the Tribunal regarding the hearing of a motion by the AFN and Canada for an order confirming that the FSA satisfies the Compensation Decision. The Tribunal and the parties to that proceeding exchanged a number of communications, in particular with respect to the Caring Society opposing the relief sought on the motion. On August 16, 2022, the Tribunal issued a direction, reaffirming the schedule it had set on August 8, 2022 for that hearing. The Tribunal also set hearing dates for potentially a hybrid hearing on September 15 and 16, 2022. Attached as **Exhibit "O"** is the Tribunal's timetable direction of August 8, 2022. Attached as **Exhibit "P"** is the Tribunal's hybrid hearing date direction of August 16, 2022. The Tribunal issued an email direction on September 1, 2022 to the effect that "the Panel has decided to move away from the hybrid hearing format and to hear the motion entirely by way of videoconferencing on September 15 and 16, 2022".

109. In July 2022, we learned of communications to the class by a law firm with no involvement in this class proceeding. The communications contained blatantly misleading information about the class action, the settlement agreement, and the claims process. We were very concerned about confusion and harm to the class given the vulnerability of the class and the history of abuse and predation on Indigenous claimants in previous settlements. The law firm refused to remove such communications to the class from its website. This became a significant issue given that notice of certification and settlement approval hearing had to be published at the same time while such misleading communications competed for class members' attention. The plaintiffs therefore brought an urgent motion for interlocutory relief,

which was heard by Madam Justice McDonald on August 17, 2022. The Court granted the interlocutory relief on August 18, 2022, and banned any communications to the class without prior approval of the Court. Madam Justice McDonald's decision is attached as **Exhibit "Q"**.

110. Once the interlocutory motion was dealt with and in light of the hearing dates set by the Tribunal in advance of this motion's hearing, which made it more certain that the Tribunal hearing will take place before September 19, 2022, the plaintiffs finalized and updated the approved notices and published them in accordance with the approved notice plan as of August 19, 2022.

111. I am advised by Zoia Petrossian, from Deloitte LLP, who has coordinated notice publication efforts that as of August 19, 2022 and in accordance with the notice plan:

(a) The designated website for opt-out and notice (http://www.fnchildcompensation.ca/) uploaded the approved notices and the online opt-out form;

(b) Class counsel and the AFN distributed the notices by mass emails to all individuals who have signed up for updates on the case;

(c) The AFN distributed the notices to all First Nations communities across the country;

(d) The Hope for Wellness Helpline was operational and available to class members prior to and as of August 19, 2022; and

(e) The administrator's telephone helpline was also operational and available to class members as of August 19, 2022.

112. Class counsel arranged for the publication of the notices on The Windspeaker, Mi'kmaq Maliseet Nations News, First Nations Drum, and the APTN. I am advised by Patricia Julian Son of Sotos LLP and believe that all digital publications for The Windspeaker, Mi'kmaq Maliseet Nations News, and APTN went live on August 19, 2022.

113. The only publication that still has print media is the Mi'kmaq Newspaper, which requires advance notice and is scheduled to print the notices as of September 1, 2022.

114. Despite many efforts, the plaintiffs have been unable to secure the publication of the notices in the First Nations Drum, which was included in the notice plan, as of the date on which I swear this affidavit. Ms. Julian Son advises me and I believe that she started communicating with the First Nations Drum as of August 2, 2022 by email and leaving a voicemail to arrange for the publication of the notices. When she did not hear back, she started calling them daily and leaving voicemails. She received a call back from someone at the First Nations Drum on August 17, 2022 who said he would put her into contact with the person in charge. However, that lead went cold, and numerous subsequent follow-ups did not yield the required publication.

115. I am advised by Ms. Petrossian that Deloitte set up a Facebook page for this case at the following URL: https://business.facebook.com/FNCFSClassAction/.

Deloitte has published the notices and advertised them on Facebook and Instagram, targeting the specific demographic.

116. Under the Court's notice approval order, the parties were to translate the notices and opt-out form to four First Nations languages (Cree, Ojibwe, Dene, and Mi'kmaq prior to publication) as agreed to by the parties.

117. I am advised by Ms. Julian Son and believe that Sotos LLP inquired with potential Indigenous language translators as of early July 2022. They identified Nations Translation Group, and delivered the notices and the opt-out form to that firm to translate to the four languages. Nations Translation Group confirmed that the translations would be prepared within three weeks from that date. Class counsel therefore expected the translations to be ready prior to August 15, 2022. Some of the translations were received as expected. In any event, all translations needed to be updated to include the final version of the notices.

118. Ms. Julian Son advises me, and I believe, that as of the date of this affidavit, we received complete translations into Dene and Mi'kmaq, which are uploaded to the case website. We have also received a complete short form notice translation into Cree, which is uploaded to the case website. We are still waiting for the balance of the updated translations. Ms. Julian Son and Deloitte have been continuously following up with Nations Translation Group. The translations will be uploaded to the case website and maintained there throughout the opt-out period.

119. I am advised by Mike DiBerardino of Deloitte, and believe, that as of the morning of September 1, 2022, the Facebook and Instagram ad campaign had received

11,261 link clicks (to the case website at www.fnchildcompensation.ca), and 1,454 people had shared the link.

K. STATE OF OPT-OUTS

120. I am advised by Mr. DiBerardino, and believe, that as of September 1, 2022, no class member appears to have opted out of the FSA. Only eight class members have filled out the online opt-out form on the case website as of that date. These individuals provided reasons on the opt-out form for opting out. Their reasons suggest that they mistakenly filled out the form in order to receive compensation, despite the several warnings about the opposite effect of opting out. The following are the reasons provided by these individuals (without personal identifying information):

Opt Out #	Reason
1	Emotional Pain
2	Familletoucher
3	not sure
4	I was in foster care
5	Broke my arm in 4 derations
6	i am a vitim of residential school both my parents and i was in and out of different foster homes which was not a positive influence inmylife, i was witness to others being sexually abused and othetrs beaten by foster parents as well i was a ictim aswell, and i do not wishthat for any other children.
7	I remember as a child, being brought into a different room at a certain time, in North Oyster
8	i was in CFS care at as child

121. Deloitte will be contacting all such individuals to confirm with them that they indeed wish to opt out.

122. Mr. DiBerardino advises me and I believe that to date Deloitte has not received any objections or notice of intention to object to the FSA at the settlement approval hearing.

L. LEGAL FEES

123. Under the FSA, legal fees are to be paid by Canada over and above the settlement funds subject to the Court's approval. As such, class counsel have agreed not to seek the approval of their percentage-based fee arrangements with the representative plaintiffs, but rather to negotiate those fees directly with Canada and thus not reduce the settlement funds available to the class.

124. Class counsel have not yet negotiated those fees with Canada as we were focussing our full attention on the FSA. Once the negotiation on fees has taken place, the matter of fees will be brought to the Court for determination on a future motion.

ORDER
(Consolidated, Leave to Commence Actions, and other Relief)

UPON MOTION, by the plaintiffs for an Order:

(a) granting leave *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 under this Court's Order dated May 28, 2019 in Court File No. T-402-19 ("**Preclusion Order**") to commence the proposed class proceeding in Court File No. T-141-20;

(b) consolidating the actions in Court File No. T-402-19 and Court File No. T-141-20 ("**Consolidated Proceeding**");

(c) adding Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson as plaintiffs to the Consolidated Proceeding;

(d) appointing Jonavon Joseph Meawasige as representative and litigation guardian for the plaintiff Jeremy Meawasige;

(e) appointing Carolyn Buffalo as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson;

(f) granting leave to serve and file the Consolidated Statement of Claim in the Consolidated Proceeding substantially in the form enclosed as **Schedule "A"** hereto;

(g) amending the style of cause in the Consolidated Proceeding accordingly, as drafted in Schedule "A" hereto;

(h) stating that the removal of the Jordan's Class members and corresponding Family Class members with claims dated between April 1, 1991 and December 11, 2007 in Court File No. T-402-19 and/or Court File No. T-141-20 from the Consolidated Proceeding is without prejudice to those class members' rights to commence a new action and to advance any arguments available to them notwithstanding this Order and notwithstanding the Consolidated Proceeding;

(i) granting the Assembly of First Nations ("**AFN**") and Zacheus Joseph Trout leave under the Preclusion Order to commence a proposed class action on behalf of the class members whose claims are separated from the Consolidated Proceedings as particularized in the draft claim substantially in the form enclosed as **Schedule "B"** hereto ("**Separated Proceeding**");

(j) stating that this Order is without prejudice to the defendant's right to contest certification and/or defend against the claims in the Separated Proceeding as it would have been immediately prior to the issuance of this Order, subject to paragraph (h), above;

(k) extending the Preclusion Order to:

i. the Consolidated Proceeding in Schedule "A" from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

ii. the Separated Proceeding from the date it is issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel;

(l) and other relief;

AND UPON being advised that the defendant consents in whole to the motion as filed;

AND UPON hearing amicus curiae and counsel's submissions;

AND UPON being satisfied of the appropriateness of the relief sought:

1. **THIS COURT ORDERS** that leave is granted *nunc pro tunc* to the plaintiffs in Court File No. T-141-20 to commence the proposed class proceeding in Court File No. T-141-20.

2. **THIS COURT ORDERS** that the actions in Court File No. T-402-19 and Court File No. T-141-20 are consolidated.

3. **THIS COURT ORDERS** that Jonavon Joseph Meawasige, Noah Buffalo-Jackson, Carolyn Buffalo, and Dick Eugene Jackson also known as Richard Jackson are added as plaintiffs to the Consolidated Proceeding.

4. **THIS COURT ORDERS** that Jonavon Joseph Meawasige is appointed as representative and litigation guardian for the plaintiff Jeremy Meawasige.

5. **THIS COURT ORDERS** that Carolyn Buffalo is appointed as representative and litigation guardian for the plaintiff Noah Buffalo-Jackson.

6. **THIS COURT ORDERS** that leave is granted to serve and file the Consolidated Statement of Claim substantially in the form enclosed as Schedule "A" hereto.

7. **THIS COURT ORDERS** that the style of cause of the Consolidated Proceeding is amended accordingly, as drafted in Schedule "A".

8. **THIS COURT ORDERS** that the separation of the claims in the Separated Proceeding from the Consolidated Proceeding is without prejudice to the rights of the class members in the Separated Proceeding to commence a new action and to advance any arguments available to them immediately prior to the issuance of this Order, notwithstanding this Order and notwithstanding the Consolidated Proceeding.

9. **THIS COURT ORDERS** that leave is granted to the plaintiffs AFN and Zacheus Joseph Trout to commence a proposed class action on behalf of the Separated Classes substantially in the form enclosed as Schedule "B" hereto.

10. **THIS COURT ORDERS** that this Order is without prejudice to the defendant's rights to contest certification and defend against the Separated Proceeding, subject to paragraph 8 of this Order.

11. **THIS COURT ORDERS** that this Court's Order dated May 28, 2019 in Court File No. T-402-19, which precludes the commencement of another proposed class proceeding in this Court in respect of the allegations in this proceeding without leave of the Court, be and is extended and shall apply to:

(a) the Consolidated Proceeding in Schedule “A” as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel; and

(b) the Separated Proceeding as of the date issued under this Order, with Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken Martineau Dumoulin as class counsel.

CLASS PROCEEDING

BETWEEN:

XAVIER MOUSHOOM, JEREMY MEAWASIGE (by his litigation guardian, JONAVON JOSEPH MEAWASIGE) AND JONAVON JOSEPH MEAWASIGE

Plaintiffs

and

THE ATTORNEY GENERAL OF CANADA

Defendant

BETWEEN:

ASSEMBLY OF FIRST NATIONS, ASHLEY DAWN LOUISE BACH, KAREN OSACHOFF, MELISSA WALTERSON, NOAH BUFFALO-JACKSON (by his litigation guardian, CAROLYN BUFFALO), CAROLYN BUFFALO AND DICK EUGENE JACKSON also known as RICHARD JACKSON

Plaintiffs

and

HER MAJESTY THE QUEEN

AS REPRESENTED BY THE ATTORNEY GENERAL OF CANADA

Defendant

ORDER AND REASONS

UPON MOTION by the Plaintiffs, on consent and determined in writing pursuant to Rule 369 of the *Federal Courts Rules*, for an order:

(a) Granting the Plaintiffs an extension of time to make this certification motion past the deadline in Rule 334.15(2)(b);

(b) Certifying this proceeding as a class proceeding and defining the class;

(C) Stating the nature of the claims made on behalf of the class and the relief sought by the class;

(d) Stipulating the common issues for trial;

(e) Appointing the Plaintiffs specified below as representative plaintiffs;

(f) Approving the litigation plan; and

(g) Other relief;

CONSIDERING the motion materials filed by the Plaintiffs;

CONSIDERING that the Defendant has advised that the Defendant consents in whole to the motion as filed;

CONSIDERING that the Court is satisfied, in the circumstances of this proceeding, that an extension of time should be granted to bring this certification motion past the deadline prescribed in Rule 334.15(2)(b);

CONSIDERING that while the Defendant's consent reduces the necessity for a rigorous approach to the issue of whether this proceeding should be certified as a class action, it does not relieve the Court of the duty to ensure that the requirements of Rule 334.16 for certification are met [see *Varley v Canada (Attorney General)*, 2021 FC 589];

CONSIDERING that Rule 334.16(1) of the *Federal Courts Rules* provides:

Subject to subsection (3), a judge shall, by order, certify a proceeding as a class proceeding if	Sous réserve du paragraphe (3), le juge autorise une instance comme recours collectif si les conditions suivantes sont réunies :
(a) the pleadings disclose a reasonable cause of action;	a) les actes de procédure révèlent une cause d'action valable;
(b) there is an identifiable class of two or more persons;	b) il existe un groupe identifiable formé d'au moins deux personnes;
(c) the claims of the class members raise common questions of law or fact, whether or not those common questions predominate over questions affecting only individual members;	c) les réclamations des membres du groupe soulèvent des points de droit ou de fait communs, que ceux-ci prédominent ou non sur ceux qui ne concernent qu'un membre;
(d) a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact; and	d) le recours collectif est le meilleur moyen de régler, de façon juste et efficace, les points de droit ou de fait communs;
(e) there is a representative plaintiff or applicant who	e) il existe un représentant demandeur qui :
(i) would fairly and adequately represent the interests of the class,	(i) représenterait de façon équitable et adéquate les intérêts du groupe,

(ii) has prepared a plan for the proceeding that sets out a workable method of advancing the proceeding on behalf of the class and of notifying class members as to how the proceeding is progressing,	(ii) a élaboré un plan qui propose une méthode efficace pour poursuivre l'instance au nom du groupe et tenir les membres du groupe informés de son déroulement,
(iii) does not have, on the common questions of law or fact, an interest that is in conflict with the interests of other class members, and	(iii) n'a pas de conflit d'intérêts avec d'autres membres du groupe en ce qui concerne les points de droit ou de fait communs,
(iv) provides a summary of any agreements respecting fees and disbursements between the representative plaintiff or applicant and the solicitor of record.	(iv) communique un sommaire des conventions relatives aux honoraires et débours qui sont intervenues entre lui et l'avocat inscrit au dossier.

CONSIDERING that, pursuant to Rule 334.16(2), all relevant matters shall be considered in a determination of whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact, including whether: (a) the questions of law or fact common to the class members predominate over any questions affecting only individual members; (b) a significant number of the members of the class have a valid interest in individually controlling the prosecution of separate proceedings; (c) the class proceeding would involve claims that are or have been the subject of any other proceeding; (d) other means of resolving the claims are less practical or less efficient; and (e) the administration of the class proceeding would create greater difficulties than those likely to be experienced if relief were sought by other means;

CONSIDERING that:

(a) The conduct of the Crown at issue in this proposed class action proceeding, as set out in the Consolidated Statement of Claim, concerns two alleged forms of

discrimination against First Nations children: (i) the Crown's funding of child and family services for First Nations children and the incentive it has created to remove children from their homes; and (ii) the Crown's failure to comply with Jordan's Principles, a legal requirement that aims to prevent First Nations children from suffering gaps, delays, disruptions or denials in receiving necessary services and products contrary to their *Charter*-protected equality rights.

(b) As summarized by the Plaintiffs in their written representations, at its core, the Consolidated Statement of Claim alleges that:

(i) The Crown has knowingly underfunded child and family services for First Nations children living on Reserve and in the Yukon, and thereby prevented child welfare service agencies from providing adequate Prevention Services to First Nations children and families.

(ii) The Crown has underfunded Prevention Services to First Nations children and families living on Reserve and in the Yukon, while fully funding the costs of care for First Nations children who are removed from their homes and placed into out-of-home care, thereby creating a perverse incentive for First Nations child welfare service agencies to remove First Nations children living on Reserve and in the Yukon from their homes and place them in out-of-home care.

(iii) The removal of children from their homes caused severe and enduring trauma to those children and their families.

(iv) Not only does Jordan's Principle embody the Class Members' equality rights, the Crown has also admitted that Jordan's Principle is a "legal requirement" and thus an actionable wrong. However, the Crown has disregarded its obligations under Jordan's Principle and thereby denied crucial services and products to tens of thousands of First Nations children, causing compensable harm.

(v) The Crown's conduct is discriminatory, directed at Class Members because they were First Nations, and breached section 15(1) of the *Charter*, the Crown's fiduciary duties to First Nations and the standard of care at common and civil law.

(c) With respect to the first element of the certification analysis (namely, whether the pleading discloses a reasonable cause of action), the threshold is a low one. The question for the Court is whether it is plain and obvious that the causes of action are doomed to fail [see *Brake v Canada (Attorney General)*, 2019 FCA 274 at para 54]. Even without the Crown's consent, I am satisfied that the Plaintiffs have pleaded the necessary elements for each cause of action sufficient for purposes of this motion, such that the Consolidated Statement of Claim discloses a reasonable cause of action.

(d) With respect to the second element of the certification analysis (namely, whether there is an identifiable class of two or more persons), the test to be applied is whether the Plaintiffs have defined the class by reference to objective criteria such that a person can be identified to be a class member without reference to the merits

of the action [see *Hollick v Toronto (City of)*, 2001 SCC 68 at para 17]. I am satisfied that the proposed class definitions for the Removed Child Class, Jordan's Class and Family Class (as set out below) contain objective criteria and that inclusion in each class can be determined without reference to the merits of the action.

(e) With respect to the third element of the certification analysis (namely, whether the claims of the class members raise common questions of law or fact), as noted by the Federal Court of Appeal in *Wenham v Canada (Attorney General)*, 2018 FCA 199 at para 72, the task under this part of the certification determination is not to determine the common issues, but rather to assess whether the resolution of the issues is necessary to the resolution of each class member's claim. Specifically, the test is as follows:

> The commonality question should be approached purposively. The underlying question is whether allowing the suit to proceed as a representative one will avoid duplication of fact-finding or legal analysis. Thus an issue will be "common" only where its resolution is necessary to the resolution of each class member's claim. It is not essential that the class members be identically situated vis-à-vis the opposing party. Nor is it necessary that common issues predominate over non-common issues or that the resolution of the common issues would be determinative of each class member's claim. However, the class members' claims must share a substantial common ingredient to justify a class action. Determining whether the common issues justify a class action may require the court to examine the significant of the common issues in relation to individual issues. In doing so, the court should remember that it may not always be possible for a representative party to plead the claims of each class member with the same particularity as would be required in an individual suit. (*Western Canadian Shopping Centres*, above at para 39; see also *Vivendi Canada Inc. v. Dell'Aniello*, 2014 SCC 1, [2014] 1 S.C.R. 3 at paras 41 and 44-46.)

Having reviewed the common issues (as set out below), I am satisfied that the issues share a material and substantial common ingredient to the resolution of each class

member's claim. Moreover, I agree with the Plaintiff that the commonality of these issues is analogous to the commonality of similar issues in institutional abuse claims which have been certified as class actions (such as the Indian Residential Schools and the Sixties Scoop class action litigation). Accordingly, I find that the common issue element is satisfied.

(f) With respect to the fourth element of the certification analysis (namely, whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law), the preferability requirement has two concepts at its core: (i) whether the class proceeding would be a fair, efficient and manageable method of advancing the claim; and (ii) whether the class proceeding would be preferable to other reasonably available means of resolving the claims of class members. A determination of the preferability requirement requires an examination of the common issues in their context, taking into account the importance of the common issues in relation to the claim as a whole, and may be satisfied even where there are substantial individual issues [see *Brake*, *supra* at para 85; *Wenham*, *supra* at para 77 and *Hollick*, *supra* at paras 27-31]. The Court's consideration of this requirement must be conducted through the lens of the three principle goals of class actions, namely judicial economy, behaviour modification and access to justice [see *Brake*, *supra* at para 86, citing *AIC Limited v Fischer*, 2013 SCC 69 at para 22].

(g) Having considered the above-referenced principles and the factors set out in Rule 334.16(2), I am satisfied a class proceeding is the preferable procedure for the just

and efficient resolution of the common questions of fact and law. Given the systemic nature of the claims, the potential for significant barriers to access to justice for individual claimants and the Plaintiffs' stated concerns regarding the other means available for resolving the claims of class members, I am satisfied that the proposed class action would be a fair, efficient and manageable method of advancing the claims of the class members.

(h) With respect to the fifth element of the certification analysis (namely, whether there are appropriate proposed representatives), I am satisfied, having reviewed the affidavit evidence filed on the motion together with the detailed litigation plan, that the proposed representative plaintiffs (as set out below) meet the requirements of Rule 334.16(1)(e);

CONSIDERING that the Court is satisfied that all of the requirements for certification are met and that the requested relief should be granted;

THIS COURT ORDERS that:

1. The Plaintiffs are granted an extension of time, *nunc pro tunc*, to bring this certification motion past the deadline in Rule 334.15(2)(b) of the *Federal Courts Rules*.

2. For the purpose of this Order and in addition to definitions elsewhere in this Order, the following definitions apply and other terms in this Order have the same meaning as in the Consolidated Statement of Claim as filed on July 21, 2021:

(a) **"Class"** means the Removed Child Class, Jordan's Class and Family Class, collectively.

(b) **"Class Counsel"** means Fasken Martineau Dumoulin LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere and Sotos LLP.

(c) **"Class Members"** mean all persons who are members of the Class.

(d) **"Class Period"** means:

(i) For the Removed Child Class members and their corresponding Family Class members, the period of time beginning on April 1, 1991 and ending on the date of this Order; and

(ii) For the Jordan's Class members and their corresponding Family Class members, the period of time beginning on December 12, 2007 and ending on the date of this Order.

(e) **"Family Class"** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Removed Child Class and/or Jordan's Class.

(f) **"First Nation"** and **"First Nations"** means Indigenous peoples in Canada, including the Yukon and the Northwest Territories, who are neither Inuit nor Métis, and includes:

(i) Individuals who have Indian status pursuant to the *Indian Act*, R.S.C., 1985, c.I-5 [*Indian Act*];

(ii) Individuals who are entitled to be registered under section 6 of the *Indian Act* at the time of certification;

(iii) Individuals who met band membership requirements under sections 10-12 of the *Indian Act* and, in the case of the Removed Child Class members, have done so by the time of certification, such as where their respective First Nation community assumed control of its own membership by establishing membership rules and the individuals were found to meet the requirements under those membership rules and were included on the Band List; and

(iv) In the case of Jordan's Class members, individuals, other than those listed in sub-paragraphs (i)-(iii) above, recognized as citizens or members of their respective First Nations whether under agreement, treaties or First Nations' customs, traditions and laws.

(g) **"Jordan's Class"** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who during the Class Period were denied a service or product, or whose receipt of a service or product was delayed or disrupted, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a jurisdictional dispute with another government or governmental department.

(h) **"Removed Child Class"** means all First Nations individuals who:

(i) Were under the applicable provincial/territorial age of majority at any time during the Class Period; and

(ii) Were taken into out-of-home care during the Class Period while they, or at least one of their parents, were ordinarily resident on a Reserve.

(i) **"Reserve"** means a tract of land, as defined under the *Indian Act*, the legal title to which is vested in the Crown and has been set apart for the use and benefit of an Indian band.

3. This proceeding is hereby certified as a class proceeding against the Defendant pursuant to Rule 334.16(1) of the *Federal Courts Rules*.

4. The Class shall consist of the Removed Child Class, Jordan's Class and Family Class, all as defined herein.

5. The nature of the claims asserted on behalf of the Class against the Defendant is constitutional, negligence and breach of fiduciary duty owed by the Crown to the Class.

6. The relief claimed by the Class includes damages, *Charter* damages, disgorgement, punitive damages and exemplary damages.

7. The following persons are appointed as representative plaintiffs:

(a) For the Removed Child Class: Xavier Moushoom, Ashley Dawn Louise Bach and Karen Osachoff;

(b) For the Jordan's Class: Jeremy Meawasige (by his litigation guardian, Jonavon Joseph Measwasige) and Noah Buffalo-Jackson (by his litigation guardian, Carolyn Buffalo); and

(c) For the Family Class: Xavier Moushoom, Jonavon Joseph Meawasige, Melissa Walterson, Carolyn Buffalo and Dick Eugene Jackson (also known as Richard Jackson),

all of whom are deemed to constitute adequate representative plaintiffs of the Class.

8. Class Counsel are hereby appointed as counsel for the Class.

9. The proceeding is certified on the basis of the following common issues:

(a) Did the Crown's conduct as alleged in the Consolidated Statement of Claim [Impugned Conduct] infringe the equality right of the Plaintiffs and Class Members under section 15(1) of the *Canadian Charter of Rights and Freedoms*? More specifically:

(i) Did the Impugned Conduct create a distinction based on the Class Members' race, or national or ethnic origin?

(ii) Was the distinction discriminatory?

(iii) Did the Impugned Conduct reinforce and exacerbate the Class Members' historical disadvantages?

(iv) If so, was the violation of section 15(1) of the *Charter* justified under section 1 of the *Charter*?

(v) Are *Charter* damages an appropriate remedy?

(b) Did the Crown owe the Plaintiffs and Class Members a common law duty of care?

(i) If so, did the Crown breach that duty of care?

(c) Did the Crown breach its obligations under the *Civil Code of Québec*? More specifically:

(i) Did the Crown commit fault or engage its civil liability?

(ii) Did the Impugned Conduct result in losses to the Plaintiffs and Class Members and if so, do such losses constitute injury to each of the Class Members?

(iii) Are Class Members entitled to claim damages for the moral and material damages arising from the foregoing?

(d) Did the Crown owe the Plaintiffs and Class Members a fiduciary duty?

(i) If so, did the Crown breach that duty?

(e) Can the amount of damages payable by the Crown be determined partially under Rule 334.28(1) of the *Federal Courts Rules* on an aggregate basis?

(i) If so, in what amount?

(f) Did the Crown obtain quantifiable monetary benefits from the Impugned Conduct during the Class Period?

(i) If so, should the Crown be required to disgorge those benefits?

(ii) If so, in what amount?

(g) Should punitive and/or aggravated damages be awarded against the Crown?

(i) If so, in what amount?

10. The Plaintiffs' Fresh as Amended Litigation Plan, as filed November 2, 2021 and attached hereto as Schedule "A", is hereby approved, subject to any modifications necessary as a result of this Order and subject to any further orders of this Court.

11. The form of notice of certification, the manner of giving notice and all other related matters shall be determined by separate order(s) of the Court.

12. The opt-out period shall be six months from the date on which notice of certification is published in the manner to be specified by further order of this Court.

13. The timetable for this proceeding through to trial shall also be determined by separate order(s) of the Court.

14. Pursuant to Rule 334.39(1) of the *Federal Courts Rules*, there shall be no costs payable by any party for this motion.

"Mandy Aylen"
Judge

This is Exhibit "C" referred to in the Affidavit of William Colish of the City of Montreal, in the Province of Quebec, affirmed before me at the City of Toronto, in the Province of Ontario on September 2, 2022, in accordance with O. Reg. 431/20, Administering Oath or Declaration Remotely.

Ottawa, Ontario, February 11, 2022

PRESENT: The Honourable Madam Justice Aylen

CLASS PROCEEDING

BETWEEN:

ASSEMBLY OF FIRST NATIONS and ZACHEUS JOSEPH TROUT

Plaintiffs

and

THE ATTORNEY GENERAL OF CANADA

Defendant

ORDER AND REASONS

UPON MOTION by the Plaintiffs, on consent and determined in writing pursuant to Rule 369 of the *Federal Courts Rules*, for an order:

(a) Granting the Plaintiffs an extension of time to make this certification motion past the deadline in Rule 334.15(2)(b);

(b) Certifying this proceeding as a class proceeding and defining the class;

(c) Stating the nature of the claims made on behalf of the class and the relief sought by the class;

(d) Stipulating the common issues for trial;

(e) Appointing the Plaintiff, Zacheus Joseph Trout, as representative plaintiff;

(f) Approving the litigation plan; and

(g) Other relief;

CONSIDERING the motion materials filed by the Plaintiffs;

CONSIDERING that the Defendant has advised that the Defendant consents in whole to the motion as filed;

CONSIDERING that the Court is satisfied, in the circumstances of this proceeding, that an extension of time should be granted to bring this certification motion past the deadline prescribed in Rule 334.15(2)(b);

CONSIDERING that while the Defendant's consent reduces the necessity for a rigorous approach to the issue of whether this proceeding should be certified as a class action, it does not relieve the Court of the duty to ensure that the requirements of Rule 334.16 for certification are met [see *Varley v Canada (Attorney General)*, 2021 FC 589];

CONSIDERING that Rule 334.16(1) of the *Federal Courts Rules* provides:

Subject to subsection (3), a judge shall, by order, certify a proceeding as a class proceeding if

(a) the pleadings disclose a reasonable cause of action;

(b) there is an identifiable class of two or more persons;

(c) the claims of the class members raise common questions of law or fact, whether or not those common questions predominate over questions affecting only individual members;

(d) a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact; and

(e) there is a representative plaintiff or applicant who

(i) would fairly and adequately represent the interests of the class,

(ii) has prepared a plan for the proceeding that sets out a workable method of advancing the proceeding on behalf of the class and of notifying class members as to how the proceeding is progressing,

(iii) does not have, on the common questions of law or fact, an interest that is in conflict with the interests of other class members, and

(iv) provides a summary of any agreements respecting fees and disbursements between the representative plaintiff or applicant and the solicitor of record.

Sous réserve du paragraphe (3), le juge autorise une instance comme recours collectif si les conditions suivantes sont réunies :

a) les actes de procédure révèlent une cause d'action valable;

b) il existe un groupe identifiable formé d'au moins deux personnes;

c) les réclamations des membres du groupe soulèvent des points de droit ou de fait communs, que ceux-ci prédominent ou non sur ceux qui ne concernent qu'un membre;

d) le recours collectif est le meilleur moyen de régler, de façon juste et efficace, les points de droit ou de fait communs;

e) il existe un représentant demandeur qui :

(i) représenterait de façon équitable et adéquate les intérêts du groupe,

(ii) a élaboré un plan qui propose une méthode efficace pour poursuivre l'instance au nom du groupe et tenir les membres du groupe informés de son déroulement,

(iii) n'a pas de conflit d'intérêts avec d'autres membres du groupe en ce qui concerne les points de droit ou de fait communs,

(iv) communique un sommaire des conventions relatives aux honoraires et débours qui sont intervenues entre lui et l'avocat inscrit au dossier.

CONSIDERING that, pursuant to Rule 334.16(2), all relevant matters shall be considered in a determination of whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of law or fact, including whether: (a) the questions of law or fact common to the class members predominate over any questions affecting only individual members; (b) a significant number of the members of the class have a valid interest in individually controlling the prosecution of separate proceedings; (c) the class proceeding would involve claims that are or have been the subject of any other proceeding; (d) other means of resolving the claims are less practical or less efficient; and (e) the administration of the class proceeding would create greater difficulties than those likely to be experienced if relief were sought by other means;

CONSIDERING that:

(a) The conduct of the Crown at issue in this proposed class action proceeding, as set out in the Statement of Claim, concerns discrimination against First Nations children in the provision of essential services and the Crown's failure to prevent First Nations children from suffering gaps, delays, disruptions or denials in receiving services and products contrary to their *Charter*-protected equality rights. The Plaintiffs allege that the Crown's conduct was discriminatory, directed at Class Members because they were First Nations, and breached section 15(1) of the *Charter*, the Crown's fiduciary duties to First Nations and the standard of care at common and civil law.

(b) With respect to the first element of the certification analysis (namely, whether the pleading discloses a reasonable cause of action), the threshold is a low one. The question for the Court is whether it is plain and obvious that the causes of action are doomed to fail [see

Brake v Canada (Attorney General), 2019 FCA 274 at para 54]. Even without the Crown's consent, I am satisfied that the Plaintiffs have pleaded the necessary elements for each cause of action sufficient for purposes of this motion, such that the Statement of Claim discloses a reasonable cause of action.

(c) With respect to the second element of the certification analysis (namely, whether there is an identifiable class of two or more persons), the test to be applied is whether the Plaintiffs have defined the class by reference to objective criteria such that a person can be identified to be a class member without reference to the merits of the action [see *Hollick v Toronto (City of)*, 2001 SCC 68 at para 17]. I am satisfied that the proposed class definitions for the Child Class and Family Class (as set out below) contain objective criteria and that inclusion in each class can be determined without reference to the merits of the action.

(d) With respect to the third element of the certification analysis (namely, whether the claims of the class members raise common questions of law or fact), as noted by the Federal Court of Appeal in *Wenham v Canada (Attorney General)*, 2018 FCA 199 at para 72, the task under this part of the certification determination is not to determine the common issues, but rather to assess whether the resolution of the issues is necessary to the resolution of each class member's claim. Specifically, the test is as follows:

> The commonality question should be approached purposively. The underlying question is whether allowing the suit to proceed as a representative one will avoid duplication of fact-finding or legal analysis. Thus an issue will be "common" only where its resolution is necessary to the resolution of each class member's claim. It is not essential that the class members be identically situated vis-à-vis the opposing party. Nor is it necessary that common issues predominate over non-common issues or that the resolution of the common issues would be determinative of each class member's claim. However, the class members' claims must

> share a substantial common ingredient to justify a class action. Determining whether the common issues justify a class action may require the court to examine the significant of the common issues in relation to individual issues. In doing so, the court should remember that it may not always be possible for a representative party to plead the claims of each class member with the same particularity as would be required in an individual suit. (Western Canadian Shopping Centres, above at para 39; see also Vivendi Canada Inc. v. Dell'Aniello, 2014 SCC 1, [2014] 1 S.C.R. 3 at paras 41 and 44-46.)

Having reviewed the common issues (as set out below), I am satisfied that the issues share a material and substantial common ingredient to the resolution of each class member's claim. Moreover, I agree with the Plaintiffs that the commonality of these issues is analogous to the commonality of similar issues in institutional abuse claims which have been certified as class actions (such as the Indian Residential Schools and the Sixties Scoop class action litigation), as well as those certified in the Moushoom class action (T-402-19/T-141-20). Accordingly, I find that the common issue element is satisfied.

(e) With respect to the fourth element of the certification analysis (namely, whether a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law), the preferability requirement has two concepts at its core: (i) whether the class proceeding would be a fair, efficient and manageable method of advancing the claim; and (ii) whether the class proceeding would be preferable to other reasonably available means of resolving the claims of class members. A determination of the preferability requirement requires an examination of the common issues in their context, taking into account the importance of the common issues in relation to the claim as a whole, and may be satisfied even where there are substantial individual issues [see *Brake*, *supra* at para 85; *Wenham*, *supra* at para 77 and *Hollick*, *supra* at paras 27-31]. The

Court's consideration of this requirement must be conducted through the lens of the three principle goals of class actions, namely judicial economy, behaviour modification and access to justice [see *Brake*, *supra* at para 86, citing *AIC Limited v Fischer*, 2013 SCC 69 at para 22].

(f) Having considered the above-referenced principles and the factors set out in Rule 334.16(2), I am satisfied a class proceeding is the preferable procedure for the just and efficient resolution of the common questions of fact and law. Given the systemic nature of the claims, the potential for significant barriers to access to justice for individual claimants and the concerns regarding the other means available for resolving the claims of class members, I am satisfied that the proposed class action would be a fair, efficient and manageable method of advancing the claims of the class members.

(g) With respect to the fifth element of the certification analysis (namely, whether there are appropriate proposed representatives), I am satisfied, having reviewed the affidavit evidence filed on the motion together with the detailed litigation plan, that the proposed representative plaintiff meets the requirements of Rule 334.16(1)(e);

CONSIDERING that the Court is satisfied that all of the requirements for certification are met and that the requested relief should be granted;

THIS COURT ORDERS that:

1. The Plaintiffs are granted an extension of time, *nunc pro tunc*, to bring this certification motion past the deadline in Rule 334.15(2)(b) of the *Federal Courts Rules*.

2. For the purpose of this Order and in addition to definitions elsewhere in this Order, the following definitions apply and other terms in this Order have the same meaning as in the Statement of Claim:

(a) **"Child Class"** means all First Nations individuals who were under the applicable provincial/territorial age of majority and who, during the Class Period, did not receive (whether by reason of a denial or a gap) an essential public service or product relating to a confirmed need, or whose receipt of said service or product was delayed, on grounds, including but not limited to, lack of funding or lack of jurisdiction, or as a result of a service gap or jurisdictional dispute with another government or governmental department.

(b) **"Class" means** the Child Class and Family Class, collectively.

(c) **"Class Counsel"** means Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere and Fasken Martineau Dumoulin LLP.

(d) **"Class Members"** mean all persons who are members of the Class.

(e) **"Class Period"** means the period of time beginning on April 1, 1991 and ending on December 11, 2007.

(f) **"Family Class"** means all persons who are brother, sister, mother, father, grandmother or grandfather of a member of the Child Class.

(g) **"First Nation"** and **"First Nations"** means Indigenous peoples in Canada, including the Yukon and the Northwest Territories, who are neither Inuit nor Métis, and includes:

i. Individuals who have Indian status pursuant to the *Indian Act*, R.S.C., 1985, c.I-5 [*Indian Act*];

ii. Individuals who are entitled to be registered under section 6 of the *Indian Act* at the time of certification;

iii. Individuals who met band membership requirements under sections 10-12 of the *Indian Act*, such as where their respective First Nation community assumed control of its own membership by establishing membership rules and the individuals were found to meet the requirements under those membership rules and were included on the Band List; and

iv. Individuals, other than those listed in sub-paragraphs (i)-(iii) above, recognized as citizens or members of their respective First Nations whether under agreement, treaties or First Nations' customs, traditions and laws by the date of trial or resolution otherwise of this action.

3. This proceeding is hereby certified as a class proceeding against the Defendant pursuant to Rule 334.16(1) of the *Federal Courts Rules*.

4. The Class shall consist of the Child Class and Family Class, all as defined herein.

5. The nature of the claims asserted on behalf of the Class against the Defendant is constitutional, negligence and breach of fiduciary duty owed by the Crown to the Class.

6. The relief claimed by the Class includes damages, *Charter* damages, disgorgement, punitive damages and exemplary damages.

7. Zacheus Joseph Trout is appointed as representative plaintiff and is deemed to constitute an adequate representative of the Class, complying with the requirements of Rule 334.16(1)(e).

8. Class Counsel are hereby appointed as counsel for the Class.

9. The proceeding is certified on the basis of the following common issues:

   (a) Did the Crown's conduct as alleged in the Statement of Claim [Impugned Conduct] infringe the equality right of the Class under section 15(1) of the *Canadian Charter of Rights and Freedoms*? More specifically:

      i. Did the Impugned Conduct create a distinction based on the Class' race, or national or ethnic origin?

      ii. Was the distinction discriminatory?

      iii. Did the Impugned Conduct reinforce and exacerbate the Class' historical disadvantages?

iv. If so, was the violation of section 15(1) of the *Charter* justified under section 1 of the *Charter*?

v. Are *Charter* damages an appropriate remedy?

(b) Was the Crown negligent towards the Class? More specifically:

i. Did the Crown owe the Class a duty of care?

ii. If so, did the Crown breach that duty of care?

(c) Did the Crown breach its obligations under the *Civil Code of Québec*? More specifically:

i. Did the Crown commit fault or engage its civil liability?

ii. Did the Impugned Conduct result in losses to the Class and if so, do such losses constitute injury to each of the members of the Class?

iii. Are members of the Class entitled to claim damages for the moral and material damages arising from the foregoing?

(d) Did the Crown owe the Class a fiduciary duty? If so, did the Crown breach that duty?

(e) Can the amount of damages payable by the Crown be determined partially under Rule 334.28(1) of the *Federal Courts Rules* on an aggregate basis? If so, in what amount?

(f) Did the Crown obtain quantifiable monetary benefits from the Impugned Conduct during the Class Period? If so, should the Crown be required to disgorge those benefits and if so, in what amount?

(g) Should punitive and/or aggravated damages be awarded against the Crown? If so, in what amount?

10. The Litigation Plan attached hereto as Schedule "A" is hereby approved, subject to any modifications necessary as a result of this Order and subject to any further orders of this Court.

11. The form of notice of certification, the manner of giving notice and all other related matters shall be determined by separate order(s) of the Court.

12. Notice of certification shall be given at the same time as the notice of certification of the companion Moushoom class action (Court File Nos. T-402-19/T-141-20), which shall be determined by separate order of this Court.

13. The opt-out period shall be six months from the date on which notice of certification is published in the manner to be specified by further order of this Court.

14. Pursuant to Rule 334.39(1) of the *Federal Courts Rules*, there shall be no costs payable by any party for this motion.

"Mandy Aylen"
Judge

SCHEDULE "C" .....

SCHEDULE "D" .....

I. DEFINITIONS

1. The definitions below will be used throughout this Litigation Plan. Any term defined in the Statement of Claim that is also used in this Litigation Plan has the same meaning as that included in the Statement of Claim or as otherwise defined by the Court.

Aggregate Damages Distribution Process means the system directed by the Court for the **Class Action Administrator** to distribute aggregate damages to **Approved Class Members**;

Approved Class Member(s) means **Approved Child Class Member(s)** and/or **Approved Family Class Members**;

Approved Family Class Member(s) means a Family Class Member who has been approved by the **Class Action Administrator** as meeting the criteria for being a Family Class Member, including the brother, sister, mother, father, grandmother or grandfather of an Approved Child Class Member (regardless of whether the Approved Child Class Member is alive) and whose approval as a Family Class Member has not been successfully challenged;

Approved Child Class Member(s) means a Child Class Member who has been approved by the **Class Action Administrator** as meeting the criteria for being a Child Class Member and whose approval as a Child Class Member has not been successfully challenged;

Certification Notice means the information set out in Schedule A to this Litigation Plan, as may be subsequently amended and as approved by the Court;

CHRT Proceeding means the proceeding before the **CHRT** under file number T1340/7008;

Claim Form means the form set out in Schedule C to this Litigation Plan used by the Child Class Members and/or the Family Class Members to submit a claim, as may be subsequently amended and as approved by the Court;

Class Action Administrator means any settlement administrator or other appropriate firm appointed by the Court to assist in the administration of the class proceeding;

Class Counsel means the consortium of law firms acting as co-counsel in this class proceeding, with the firms of Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Company, Nahwegahbow Corbiere, and Fasken LLP as Solicitors of Record;

Class Member(s) means an individual who falls within the definition of the Child Class and/or the Family Class, as pleaded in the Statement of Claim and as approved by the Court;

Common Issues means the issues listed in the Notice of Motion for Certification, or as found by the Court, as may be subsequently amended and as approved by the Court;

Common Issues Notice means the information set out in the notice regarding the **Common Issues** to be certified by the Court at Certification, as may be subsequently amended and as approved by the Court;

Crown Class Member Information means information to be provided by the Crown, at the request of the plaintiffs and/or as ordered by the Court, to the **Class Action Administrator** and/or **Class Counsel** regarding the names and last known contact information of all individuals who meet the criteria of Class Members as set out in the Statement of Claim or as otherwise defined by the Court, including a list of all known Class Members' names and last known addresses using the information in the Crown's possession or under its control.[1]

Individual Damage Assessment Form means the form set out in Schedule D to this Litigation Plan, as may be subsequently amended and as approved by the Court, to be used by **Approved Class Member(s)** to elect an individual assessment of their damages and commence an individual damage assessment under the **Individual Damage Assessment Process**;

Individual Damage Assessment Process means the procedure and system to be approved by the Court following the **Common Issues** trial to be used to assess and distribute damages to **Approved Class Member(s)** who have requested an individual damage assessment by submitting an **Individual Damage Assessment Form**;

Notice Program means the process, set out in this Litigation Plan, for communicating the **Certification Notice** and/or the **Common Issues Notice** to **Class Members**, as may be subsequently amended and as approved by the Court;

Opt Out Form means the form set out in Schedule B to this Litigation Plan used by Class Members to opt out of the class proceeding, as may be subsequently amended and as approved by the Court;

Opt Out Period means the deadline, proposed by the plaintiffs as 180 days post Certification or as determined by the Court, to opt out of the class proceeding;

Opt Out Procedures means the procedures, set out in the Litigation Plan, for Class Members to opt out of this class proceeding, as may be subsequently amended and as approved by the Court; and

Special Opt Out Procedures means the procedures, set out in the Litigation Plan, for Class Members who have already commenced a civil proceeding in Canada or who are known

---

[1] Where Class Members are known to be represented by counsel, only their name should be provided along with their counsel's name and address.

by the Crown to have already retained legal counsel to opt out of this class proceeding, as may be subsequently amended and as approved by the Court.

II. OVERVIEW

2. The plaintiffs have commenced this action on behalf of First Nations individuals who allege that the Crown has breached their equality rights, depriving them of public services and products. The class action advances the rights of thousands of First Nations children and family members.

3. This Litigation Plan is advanced as a workable method of advancing the proceeding on behalf of the Class and of notifying Class Members as to how the class proceeding is progressing, pursuant to rule 334.16(1)(e)(ii) of the *Federal Court Rules*. The Litigation Plan is modelled on the class action relating to the Indian Residential Schools,[2] with numerous alterations made in order to streamline the procedure and to take into account lessons learned from that settlement.

4. This Litigation Plan sets out a detailed plan for the common stages of this litigation, and sets out, on a preliminary without prejudice basis, an early plan for how the individual stage of the action may progress. Given the early stage of the litigation, the plan is necessarily subject to substantial revisions as the case progresses.

III. PRE-CERTIFICATION PROCESS

5. The plaintiffs are litigating this action in parallel with a closely interrelated consolidated class action (Court File Nos. T-402-19 / T-141-20) about First Nations child and family services

---

[2] See *Baxter v Canada (Attorney General)*, 2006 CanLII 41673 (Ont Sup Ct), and subsequent orders of the Court. See also information available on the website of the Indian Residential Schools Adjudication Secretariat, online <http://www.iap-pei.ca/home-eng.php>.

25

and Jordan's Principle. Therefore, much of the work and processes are shared between the two actions.

A. The Parties

i. The Plaintiffs

6. The plaintiffs have proposed two classes:

   (a) the Child Class; and

   (b) the Family Class.

7. The proposed representative plaintiff is Zacheus Joseph Trout.

ii. The Defendant

8. The defendant is the Crown.

B. The Pleadings

i. Statement of Claim

9. The plaintiffs have delivered a Statement of Claim.

ii. Statement of Defence

10. The Crown has not delivered a Statement of Defence.

iii. Third Party Claim

11. The Crown has not issued any Third Party Claim.

C. Preliminary Motions

12. The plaintiffs propose that any preliminary motions be dealt with at the Motion for Certification or as directed by the Court.

D. Pre-Certification Communication Strategy

i. Responding to Inquiries from Putative Class Members

13. Both before and since the commencement of this class proceeding, Class Counsel have received many communications from Class Members affected by this class proceeding.

14. With respect to each inquiry, the individual's name, address, email and telephone number are added to a confidential database. Class Members are asked to register on the websites of Class Counsel. Once registered, they receive updates on the progress of the class proceeding in French and English. Any individual Class Members who contact Class Counsel are responded to in their preferred language.

ii. Pre-Certification Status Reports

15. In addition to responding to individual inquiries, Class Counsel have created a webpage concerning the class proceeding in English and French (see: https://sotosclassactions.com/cases/current-cases/first-nations-youth/). The most current information on the status of the class proceeding is posted and is updated regularly in English and French.

16. Copies of the publicly filed court documents and court decisions are accessible from the webpage. In addition, phone numbers for Class Counsel in Quebec and Ontario as well as email contact information are provided.

17. Class Counsel sends update reports to Class Members who have provided their contact information and have indicated an interest in being notified of further developments in the class proceeding.

iii. Pre-certification outreach

18. Class Counsel have presented the proposed class action to a council of First Nations social services delivery personnel for the Province of Québec and the region of Labrador, as well as the First Nations youth directors forum in British Columbia. Class Counsel are in the process of arranging similar presentations to affected communities in Québec and elsewhere in Canada.

E. Settlement Conference

i. Pre-Certification Settlement Conference

19. The plaintiffs will participate in a pre-Certification Settlement Conference to determine whether any or all of the issues arising in the class proceeding can be resolved.

20. The plaintiffs propose that a pre-Certification Settlement Conference be conducted at least one month after the Motion for Certification and responding materials, if any, have been filed with the Court.

F. Timetable

i. Plaintiffs' Proposed Timetable for the Pre-Certification Process

21. The plaintiffs propose that the pre-Certification process timetable set out below be imposed by Court Order at an early case conference.

	Deadline
Plaintiffs' Certification Motion Record	Date of Serving and Filing the Notice of Motion for Certification and Motion Record ("**DOF**")
Respondent's Motion Record, if any	Within 90 days from DOF
Plaintiffs' Reply Motion Record, if any	Within 120 days from DOF

Cross-examinations, if any, to be completed	Within 150 days from DOF
Undertakings answered	Within 180 days from DOF
Motions arising from cross-examinations, if any, heard	Within 210 days from DOF
Further cross-examinations, if necessary, completed by	Within 230 days from DOF
Plaintiffs' Memorandum of Fact and Law	Within 250 days from DOF
Respondent's Memorandum of Fact and Law	Within 280 days from DOF
Plaintiffs' Reply, if any	Within 300 days from DOF
Motion for Certification and all other Motions commencing	Within 310 days from DOF

IV. POST-CERTIFICATION PROCESS

A. Timetable

i. Plaintiffs' Timetable for the Post-Certification Process

22. The plaintiffs intend to proceed to trial on an expedited basis or a hybrid summary judgment/*viva voce* trial.

23. The plaintiffs propose that the following post-Certification process timetable, as explained in detail below, be imposed by the Court upon Certification:

Certification Notice to Class Members commences	Upon Certification
Exchange Affidavits of Documents within	70 days from certification
Motions for Production of Documents, Multiple Examinations of Crown representatives or for Examinations of Non-Parties to be conducted within	110 days from certification

Examinations for Discovery to be conducted within	140 days from certification
Certification Notice to Class Members completed within	90 days from certification
Trial Management Conference re: Expert Evidence	170 days from certification
Motions arising from Examinations for Discovery within	190 days from certification
Undertakings answered within	160 days from certification
Further Examinations, if necessary, within	210 days from certification
Common Issues Pre-Trial to be conducted	250 days from certification
Opt Out Period deadline	180 days from certification
Common Issues Trial or Hybrid Trial to be conducted within	300 days from certification

B. Certification Notice, Notice Program and Opt Out Procedures

i. Certification Notice

24. The Certification Notice and all other notices to Class Members provided by the plaintiffs will, once finalized and approved by the Court, be translated into French. The plaintiffs will explore whether it will be necessary to translate the Certification Notice and/or other notices into some First Nations languages, subject to Court approval.

25. The Certification Notice will, subject to further amendments, be in the form set out in Schedule A hereto.

ii. Notice Program

26. The plaintiffs propose to communicate the Certification Notice to Class Members through the following Notice Program.

27. The plaintiffs will provide Certification Notice to Class Members by arranging to have the Certification Notice (and its translated versions whenever possible) communicated/published in the following media within 90 days of Certification, as frequently as may be reasonable or as directed by the Court under rule 334.32 of the *Federal Courts Rules*. In particular, the plaintiffs propose the following means of providing Certification Notice:

(a) A press release within 15 days of the Certification order being issued;

(b) Direct communication with Class Members:

(i) by email or regular mail to the last known contact information of Class Members provided by the Crown (*i.e.*, Crown Class Member Information);

(ii) by email or regular mail to all Class Members who have provided their contact information to Class Counsel, including through the Class Proceeding's webpage;

(c) Distribution to the Assembly of First Nations for circulation to its membership of First Nations bands across Canada;

(d) Email to First Nations children's aid societies across Canada;

(e) Circulation through the following media:

(i) Aboriginal newspapers/publications such as First Nations Drum, The Windspeaker, Mi'kmaq Maliseet Nations News, APTN National News; and

(ii) social media outlets, such as Facebook and Instagram.

iii. Opt Out Procedures

28. The plaintiffs propose Opt Out Procedures for Class Members who do not wish to participate in the class proceeding.

29. The Certification Notice will include information about how to Opt Out of the class proceeding and will provide information about how to obtain and submit the appropriate Opt Out Forms to the Class Action Administrator and/or Class Counsel.

30. There will be one standard Opt Out Form for all Class Members.

31. Class Members will be required to file the Opt Out Form with the Class Action Administrator and/or Class Counsel within the Opt Out Period, proposed by the plaintiffs as 180 days post Certification or as directed by the Court.

32. The Class Action Administrator or Class Counsel shall, within 30 days after the expiration of the Opt Out Period, deliver to the Court and the Parties an affidavit listing the names of all persons who have opted out of the Class Action.

iv. Special Opt Out Procedures

33. The plaintiffs propose Special Opt Out Procedures for Class Members who are either named party plaintiffs in a civil proceeding in Canada or who are known by the Crown to have retained legal counsel in respect of the subject matter of this action with the express purpose of starting a separate action against the Crown.

C. Identifying and Communicating with Class Members

i. Identifying Class Members

34. As stated above, the plaintiffs intend to request the Crown Class Member Information.

ii. Database of Class Members

35. Class Counsel will maintain a confidential database of all Class Members who contact Class Counsel. The database will include each individual's name, address, telephone number, and email address where available.

iii. Responding to Inquiries from Class Members

36. Class Counsel and their staff will respond to each inquiry by Class Members.

37. Class Counsel will have a system in place to allow for responses to inquiries by Class Members in their language of choice whenever possible.

iv. Post Certification Status Reports

38. In addition to responding to individual inquiries, Class Counsel will continually update the webpage dedicated to this class action with information concerning the status of the class proceeding.

39. Class Counsel will send update reports to Class Members who have provided their contact information. These update reports will be sent as necessary or as directed by the Court.

D. Documentary Production

i. Affidavit/List of Documents

40. The plaintiffs will be required to deliver an Affidavit of Documents within 70 days after Certification. The Crown will similarly be required to deliver a List of Documents within 70 days after Certification.

41. The Parties are expected to serve Supplementary Affidavits (or Lists) of Documents as additional relevant documents are located.

ii. Production of Documents

42. All Parties are expected to provide, at their own expense, electronic copies of all Schedule "A" productions at the time of delivering their Affidavit of Documents. All productions are to be made in electronic format.

iii. Motions for Documentary Production

43. Any motions for documentary production shall be made within 110 days of Certification.

iv. Document Management

44. The Parties will each manage their productions with a compatible document management system, or as directed by the Court. All documents are to be produced in OCR format.

45. All productions should be numbered and scanned electronically to enable quick access and efficient organization of documents.

E. Examinations for Discovery

46. Examinations for Discovery will take place within 140 days of Certification.

47. The plaintiffs expect to request the Crown's consent to examine more than one Crown representative. In the event that a dispute arises in this regard, the plaintiffs propose to bring a motion within 110 days after Certification.

48. The plaintiffs anticipate that the Examination for Discovery of properly selected and informed officers of the Crown will take approximately 10 days, subject to refusals and undertakings.

49. The plaintiffs anticipate that the Examination for Discovery of the representative plaintiffs will take approximately one day, subject to refusals and undertakings.

F. Interlocutory Matters

i. Undertakings

50. Undertakings are to be answered within 160 days of Certification.

ii. Motions for Refusals and Undertakings

51. Specific dates for motions for undertakings and refusals that arise from the Examinations for Discovery will be requested upon Certification. Motions for refusals and undertakings will be heard within 190 days of Certification.

iii. Re-attendances and Further Examinations for Discovery

52. Any re-attendances or further Examinations for Discovery required as a result of answers to undertakings or as a result of the outcome of the motions for refusals and undertakings should be completed within 210 days of Certification.

G. Expert Evidence

i. Identifying Experts and Issues

53. A Trial Management Conference will take place following Examinations for Discovery at which guidelines for identifying experts and their proposed evidence at trial will be determined.

H. Determination of the Common Issues

i. Pre-Trial of the Common Issues

54. Upon Certification, the Court will be asked to assign a date for a Pre-Trial Conference relating to the Common Issues trial.

55. The plaintiffs expect that a full day will be required for a Pre-Trial Conference and will request that the Pre-Trial be held 250 days after Certification and, in any event, at least 90 days before the date of the Common Issues trial.

ii. Trial of the Common Issues

56. Upon Certification, the Court will be asked to assign a date for the Common Issues trial.

57. The plaintiffs propose that the trial of the Common Issues be held 300 days after Certification.

58. The length of time required for the Common Issues trial will depend on many factors and will be determined at the Trial Management Conference.

V. POST COMMON ISSUES DECISION PROCESS

A. Timetable

i. Plaintiffs' Timetable for the Post-Common Issues Decision Process

59. The plaintiffs propose that the following timetable be imposed by the Court following the Court's judgment on the Common Issues:

Common Issues Notice provided	Within 90 days of Common Issues decision
Individual Issue Hearings, if any, begin	120 days after decision
Individual Damage Assessments, if any, begin	240 days after decision
Deadline to Submit Claim Forms (as of right)	Within 1 year of decision
Deadline to Submit Claim Forms (as of right in prescribed circumstances or with leave of the Court)	1 year after decision

B. Common Issues Notice

i. Notifying Class Members

60. The Common Issues Notice will, subject to further amendments, be substantially in the form approved by the Court at the Common Issues trial. The Common Issues Notice may contain, amongst others, information on any aggregate damages awarded and any issues requiring individual determination, as approved by the Court.

61. The plaintiffs propose to circulate the Common Issues Notice within 90 days after the Common Issues judgment.

62. The Common Issues Notice will be circulated in the same manner as set out above dealing with the Certification Notice or as directed by the Court.

C. Claim Forms

i. Use of Claim Forms

63. The Court will be asked to approve under rule 334.37 the use of standardized Claim Forms by Class Members who may be entitled to a portion of the aggregate damage award or who may be entitled to have an individual assessment.

ii. Obtaining and Filing Claim Forms

64. The procedure for obtaining and filing Claim Forms will be set out in the Common Issues Notice.

65. The plaintiffs propose to use a single standard Claim Form, substantially in the form attached as Schedule C, for all three classes, subject to further amendments and as approved by the Court.

66. The plaintiffs propose that counselling be made available to Class Members in need of support and assistance when completing the Claim Forms. Where necessary, a process for appointing a guardian or trustee to assist the Class Members will be developed.

67. Before completing a Claim Form, Class Members will be able to review information about them in the possession of Canada relevant to their claim (the Crown Class Member Information). That information may include:

(a) any records relating to the Class Member's voluntary or involuntary placement in out-of-home care during the Class Period;

(b) any records relating to a need by the Class Member for a service or product;

(c) any records relating to a request made by the Class Member for a service or product;

(d) any records relating to the denial of a service or product to the Class Member;

(e) any records relating to any service(s) or product(s) provided by the Crown to the Class Member; and/or

(f) any records relating to the family status or family relationship between a Family Class Member and a Child Class Member.

68. Class Members will be required to file the appropriate Claim Form with the Class Action Administrator and/or Class Counsel within the deadlines set out below or as directed by the Court.

69. The Class Action Administrator will be responsible for receiving all Claim Forms.

iii. Deadline for Filing Claim Forms

70. Class Members will be advised of the deadline for filing Claim Forms in the Common Issues Notice.

71. The plaintiffs propose that Class Members be given one year, or such period as set out by the Court, after the Common Issues judgment to file Claim Forms as of right.

72. The plaintiffs propose that Class Members be entitled to file Claim Forms more than one year after the Court's judgment on the Common Issues in certain circumstances prescribed by the Court (*i.e.*, lack of awareness of entitlement, etc.) or with leave of the Court (*i.e.*, based on mental or physical health issues, etc.).

D. Determining and Categorizing Class Membership

i. Approving Child Class Members

73. The Class Action Administrator will determine whether an individual submitting a Claim Form as a Child Class Member properly qualifies as a Class Member.

74. The Class Action Administrator will make these determinations following guidelines determined by the Court at the Common Issues trial in part by referring to the information set out in the Claim Form. Such guidelines may include: (a) whether the Class Member needed a service or product at any point during the Class Period; (b) whether the Class Member was denied that service or product; (c) whether the Class Member's receipt of a service or product was delayed or disrupted; (d) whether such denial, disruption or delay was based on lack of funding, lack of jurisdiction or a jurisdictional dispute between governments or government departments; and/or (e) whether such denial, disruption or delay happened while the Class Member was under the applicable provincial/territorial age of majority.

75. The Class Action Administrator will also make these determinations in part by referring to the Crown Class Member Information regarding the number of Class Members who have received a service or product under Jordan's Principle under orders made in the CHRT Proceeding.

76. The Class Action Administrator will, where appropriate and necessary, request in writing further information from the individual submitting the Child Class Claim Form or the Crown to make these determinations.

ii. Approving Family Class Members

77. The Class Action Administrator will determine whether an individual submitting a Family Class Claim Form properly qualifies as a Family Class Member.

78. These determinations will be made by the Class Action Administrator by referring to Crown Class Member Information and the information set out in the Claim Form with respect to the relationship of the proposed Family Class Member with an Approved Child Class Member.

79. The Class Action Administrator will, where appropriate and necessary, request in writing further information from the individual filing the Claim Form to make these determinations.

iii. Deceased Class Members

80. The estate of a deceased Class Member may submit a Claim Form if the deceased Class Member died on or after April 1, 1991.

81. If the deceased Class Member would otherwise have qualified as an Approved Class Member, the estate will be entitled to be compensated in accordance with the Aggregate Damages Distribution Process. The estate will not have the option to proceed under the Individual Damage Assessment Process except with leave of the Court.

iv. Notifying Class Members, Challenging and Recording Decisions

82. Within 30 days of receipt of a Claim Form, the Class Action Administrator will notify the individual of its decision on whether the individual is an Approved Class Member. Individuals who are not approved as Class Members will be provided with information on the procedures to follow to challenge the decision of the Class Action Administrator. The plaintiffs propose that these procedures include an opportunity to resubmit an amended Claim Form with supporting documentation capable of verifying that the individual is a Class Member.

83. All interested parties will be provided with the ability to appeal a decision by the Class Action Administrator to the Court or in a manner to be prescribed. Class Counsel may challenge the decision on behalf of affected individuals.

84. The Class Action Administrator will keep records of all Approved Class Members and their respective Claim Forms and will provide this information to Class Counsel, the Crown and other interested parties on a monthly basis. Class Counsel and/or other interested parties will have 30 days after receiving this information to challenge the Class Action Administrator's decision by advising the Class Action Administrator and the other affected parties in writing of the basis for their challenge. The responding party will be given 30 days thereafter to respond in writing to the challenge at which time the Class Action Administrator will reconsider its decision and advise all parties.

E. Aggregate Damages Distribution Process

i. Distribution of Aggregate Damages

85. The Class Action Administrator will distribute the aggregate damages to all Approved Class Members in the manner directed by the Court.

86. The plaintiffs will propose that Approved Class Members be entitled to a proportion of the aggregate damages as determined by the Class Action Administrator based on factors to be approved by the Court, including but not limited to: (a) the duration of deprivation from a service or product as a result of a delay, denial or disruption; (b) the importance of the service or product to the child; and (c) the family relationship of the Family Class Member to a given Child Class Member.

87. The Class Action Administrator, upon advising Approved Class Members of its decision on their membership as set out above, will within a reasonable period of time to be determined by the Court, advise the Approved Class Members of the proportion of aggregate damages owing to each Approved Class Member under the Aggregate Damages Distribution Process to be approved by the Court.

88. In addition, if applicable, the Class Action Administrator will provide Approved Class Members with a package of materials including: information on how to collect their aggregate damage awards, information on Class Members' ability to proceed through the Individual Damage Assessment Process, copies of the Individual Damage Assessment Form along with a guide on how to complete the form, and contact information for obtaining independent legal advice and counselling. Such information is to be provided in a culturally responsive and appropriate style, making full use of interactive media, including video tutorials.

ii. Seeking an Individual Damage Assessment

89. Approved Class Members, when notified of their entitlement to aggregate damages, may be given information on their right to have their compensation individually assessed under the Individual Damage Assessment Process set out below.

F. Individual Damage Assessment Process

i. Individual Damage Assessment Forms

90. When Approved Class Members are notified of their aggregate damage entitlement and information on their right to proceed under the Individual Damage Assessment Process, they will be provided with an Individual Damage Assessment Form as set out in Schedule D.

91. If applicable, the plaintiffs propose that a request for individual damages be made by sending an Individual Damage Assessment Form to the Class Action Administrator, and that only those individuals who wish to proceed through the Individual Damage Assessment Process be required to submit Individual Damage Assessment Forms.

ii. Individual Damage Assessments

92. The Court may be asked to approve the use of an Individual Damage Assessment Process after a judgment on the Common Issues or otherwise as directed by the Court.

93. The Individual Damage Assessment Process would be available to all Approved Class Members except those who are found by the Court not to be entitled to individual damages following the Common Issues trial.

iii. Individual Issue Hearings

94. The Court will be asked to provide directions, or to appoint persons to conduct references under rule 334.26 of the *Federal Courts Rules* or appoint a judge to conduct test cases involving selected Approved Class Members who are proceeding under the Individual Damage Assessment Process to assist with the matters that may or may not remain in issue after the determination of the Common Issues, such as:

(a) Hearing rules for individual assessments;

(b) A compensation matrix for individual damages;

(c) Assistance in resolving disputes relating to the definitions of key terms such as "essential service", "delay", and "jurisdictional dispute"; and

(d) Other matters raised by the Court or the parties during the Common Issues litigation.

G. Fees

i. Plaintiffs' Legal Fees

95. The plaintiffs' fees are to be paid on a contingency basis, subject to the Court's approval under rule 334.4 of the *Federal Courts Rules*.

96. The agreement between the representative plaintiffs and Class Counsel states that legal fees and disbursements to be paid to Class Counsel shall be on the following basis:

(a) Aggregate damages recovery: 20% of the first two hundred million dollars ($200,000,000) in recovery by settlement or judgment, plus 10% of any amounts recovered by settlement or judgment beyond the first two hundred million dollars; and

(b) Individual damages recovery: 25% of settlement or judgment.

ii. Funding of Disbursements

97. Funding of legal disbursements for the representative plaintiffs has been, and will continue to be, made through Class Counsel, unless the plaintiffs and Class Counsel subsequently deem it to be in the best interests of the Class to obtain third-party funding, in which case Class Counsel will advise the Court of such third-party funding and seek approval thereof.

H. Settlement Issues

i. Settlement Offers and Negotiations

98. The plaintiffs will conduct settlement negotiations with the Crown from time to time with a view to achieving a fair and timely resolution.

ii. Mediation and Other Non Binding Dispute Resolution Mechanisms

99. The plaintiffs will participate in mediation or other non-binding dispute resolution mechanisms, if and when appropriate, in an effort to try to resolve the dispute or narrow the issues in dispute between the Parties.

I. Review of the Litigation Plan

i. Flexibility of the Litigation Plan

100. This Litigation Plan will be reconsidered on an ongoing basis and may be revised under the continued case management authority of the Court before or after the determination of the Common Issues or as the Court sees fit.

PROPOSED NOTICE OF CERTIFICATION

THIS NOTICE MAY AFFECT YOUR RIGHTS. PLEASE READ CAREFULLY.

The Nature of the Lawsuit

As of March 2019, Sotos LLP, Kugler Kandestin LLP, Miller Titerle + Co., Nahwegahbow Corbiere, and Fasken LLP (collectively "Class Counsel") have prosecuted an action on behalf of First Nations plaintiffs in the Federal Court of Canada in Montreal, against the Attorney General of Canada (the "Crown").

The lawsuit claims that between April 1, 1991 and December 11, 2007 the Crown instituted discriminatory policies across Canada, delaying, disrupting or denying the delivery of needed public services and products to First Nations youth.

The action was brought on behalf of a Class of:

(a) all First Nations youths who were denied a public service or product, or whose receipt of a public service or product was delayed or disrupted, on the grounds of lack of funding or lack of jurisdiction, or as a result of a jurisdictional dispute with another government or governmental department between April 1, 1991 and December 11, 2007;

(b) family members of the Class Members cited in (a) above.

By order dated **[INSERT DATE]**, The Honourable Justice [**INSERT NAME**] certified the action as a class proceeding, appointing Zacheus Joseph Trout as representative plaintiffs for the class.

The Court found that the following issues affecting the Class will be tried at a Common Issues trial:

- **[INSERT CERTIFIED COMMON ISSUE]**
- …

Participation in the Class Action

If you fall within the class definition, you are automatically included as a member of the Class, unless you choose to opt out of the Class Action, as explained below. All members of the Class will be bound by the judgment of the Court, or any settlement reached by the parties and approved by the Court.

At this juncture, the Court has not taken a position as to the likelihood of recovery for the representative plaintiffs or the Class, or with respect to the merits of the claims or defences asserted by the Crown.

Fees and Disbursements

You do not need to pay any legal fees out of your own pocket. A retainer agreement has been entered into between the representative plaintiffs and Class Counsel with respect to legal fees. The agreement provides that the law firms have been retained on a contingency fee basis, which means they will only be paid their fees in the event of a successful result in the litigation or a Court-approved settlement.

You will <u>not</u> be responsible for Defendant's legal costs if the class action is unsuccessful. Any fee paid to lawyers for the Class is subject to the Court's approval.

Opt Out

If you are a class member and wish to exclude yourself from this class proceeding ("opt out"), you must complete and return the "Class Member Opt Out" form by no later than **[INSERT DATE]**. The Opt Out form may be downloaded at: **[INSERT WEBSITE ADDRESS]**.

Class members who choose to opt out within the above noted deadline will not recover any monies if the representative plaintiffs are successful in this action. If class members do not choose to opt out by the deadline, they will be bound by any judgment ultimately obtained in this class action, whether favourable or not, or any settlement if approved by the Court.

Contact Information

If you have any questions or concerns about the matters in this Notice or the status of the class action, you may contact Class Counsel in a number of ways.

OFFICE OF THE PARLIAMENTARY BUDGET OFFICER
BUREAU DU DIRECTEUR PARLEMENTAIRE DU BUDGET

The Parliamentary Budget Officer (PBO) supports Parliament by providing economic and financial analysis for the purposes of raising the quality of parliamentary debate and promoting greater budget transparency and accountability.

This report estimates the financial cost of complying with a Canadian Human Rights Tribunal decision (2019 CHRT 39) as it relates to First Nations children taken into care. It was prepared at the request of Mr. Charlie Angus, Member of Parliament for Timmins-James Bay.

Some data used in this publication came from the First Nations Component of the 2008 Canadian Incidence Study of Reported Child Abuse and Neglect (FNCIS 2008). These data were used with the permission of the First Nations Child Welfare Research Committee. The study was funded by the federal, provincial, and territorial governments of Canada, the Social Sciences and Humanities Research Council of Canada, and the Canadian Foundation for Innovation.

The PBO thanks the First Nations Child and Family Caring Society, the First Nations Child Welfare Research Committee and Indigenous Services Canada for the information and explanations they provided to assist with this analysis. The analyses and interpretations presented in this report are those of the PBO and do not necessarily reflect the opinions of the above-mentioned organizations.

For readability, all counts have been rounded to hundreds of persons.

Notes 20

Executive Summary

In September 2019, the Canadian Human Rights Tribunal (CHRT) ordered Canada to pay compensation to First Nations children and caregivers who were affected by the on-reserve child welfare system.

The Government of Canada has applied for judicial review of the CHRT decision, which could result in the compensation order being dramatically narrowed or voided entirely. This report estimates the cost of complying with the decision as it relates to children taken into care.

The preliminary estimate of Indigenous Services Canada (ISC) was that 125,600 people are eligible for compensation totalling $5.4 billion. Based on the PBO's assumed legal interpretation, the PBO estimates that 19,000 to 65,100 people are eligible for compensation in a range of $0.9 billion to $2.9 billion. Both estimates assume compensation is paid by the end of 2020.

Summary Table 1

High-level comparison of estimates

	ISC	PBO
# Eligible	125,600	19,000 to 65,100
Cost to compensate ($ billions)	$5.4	$0.9 to $2.9

The PBO expects fewer people to be eligible primarily because we assume that children placed within their extended family or community are not eligible for compensation.

Our estimate is presented as a range, as it is unclear what proportion of children will be excluded, either because the CHRT deems that their removal was necessary, or that their family benefited from prevention services. This report examines a number of scenarios under which these two eligibility criteria might be applied, and their possible impact on eligibility for compensation.

The Government of Canada has indicated that it intends to compensate those harmed by removals through the settlement of a class action. There may be significant barriers to a successful class action, which could result in fewer families receiving compensation. In addition, compensation for each removed child would not necessarily be more than the amount awarded by the CHRT.

1. Introduction

In September 2019, the Canadian Human Rights Tribunal (CHRT) ordered Canada to pay compensation to certain First Nations children and caregivers who were harmed by racial discrimination in federal funding for child and family services on-reserve and in Yukon.[1]

The decision included orders of compensation related to the removal of children from their family and related to delays and denials of essential services to children. This report focuses solely on compensation for removals. It includes compensation for removals to receive services but excludes compensation for delays and denials of services to children who remained in their homes.

The preliminary estimate of Indigenous Services Canada (ISC) was that 125,600 people are eligible for compensation totalling $5.4 billion, including interest. Based on the PBO's assumed legal interpretation, we estimate that 19,000 to 65,100 individuals are eligible for compensation that would range from $0.9 billion to $2.9 billion, including interest.

The PBO assumes that the CHRT decision requires Canada to pay $40,000 to all First Nations children ordinarily resident on-reserve or in Yukon at the time of their removal who were:

1. Unnecessarily removed from their home, family, and community after 1 January 2006 due to poverty, poor housing, neglect, or substance abuse and did not benefit from prevention services that would have permitted them to remain safely in their home, family and community;

2. Removed from their homes after 1 January 2006 due to abuse and placed outside their family and community; or

3. Were deprived of essential services within the scope of Jordan's Principle[2] and placed in care outside their homes, families and communities in order to receive those services between 12 December 2007 and 2 November 2017.

For each eligible child removed for reasons other than abuse, the parent(s) or grandparents of that removed child are also entitled to $40,000 in compensation.[3]

All the major parties to the CHRT proceedings have varying legal interpretations that differ from each other and from the PBO's assumptions set out above.[4] The PBO's assumed legal interpretation is an objective assessment of what the CHRT order requires; it is not a normative position regarding what compensation should have been ordered. The CHRT may

revise its order as parties seek clarification, as the CHRT did through a letter dated 16 March 2020.[5]

The Government of Canada has applied for judicial review of the decision, which could dramatically reduce or entirely void this compensation order.[6] The Tribunal's orders are also suspended pending a decision by the Tribunal regarding the process to be used to identify those eligible for compensation. Ongoing discussions or future CHRT orders could change the scope of who is entitled to compensation relative to what is required by the September CHRT order.

The PBO's estimate reflects the cost of paying the compensation ordered by the CHRT; it is not discounted for the probability of that order being reduced or voided through judicial review.

2. Cost of complying with the CHRT order

2.1. Placements by type

Based on data supplied by ISC from their financial records, the PBO estimates that 53,700 children will have been removed from their home - either on-reserve or in Yukon[7] - and placed in ISC-funded placements from 1 January 2006 to the end of 2020. This includes 8,500 children already in care in 2006.

Because this figure is based on ISC's financial records, it excludes unfunded placements of First Nations children with family, family friends or community members, where no federal expenditure would be recorded.

ISC classifies funded placements into four types: kinship care, foster care, institutional care, and group homes. The estimated breakdown of placements is shown in Table 2-1.

Table 2-1 Number of children taken into funded care for the first time by care type (2006-2020)

	#
Kinship[8]	12,500
Foster[9]	36,700
Institutional	2,100
Group Homes	2,400
Total	***53,700***

Source: PBO based on data derived from ISC's Child and Family Services Information Management System (CFS IMS).

Notes: This represents an estimate of the number of unique children who will have been taken into care for the first time at some point from 2006 up to the end of 2020. Removals prior to 2014 were estimated based on indexing to point-in-time counts.[10] The type of care is based on the child's first placement.

2.2. Placements outside family and community

According to the CHRT decision, compensation is awarded in relation to children placed in care outside of their homes, families and communities.[11] Thus, children removed from their home and placed within their extended family or community are not eligible for compensation.

By definition, children placed in informal or formal kinship foster care remain within their families or their communities for that placement. In addition, some children placed in non-kinship foster care and group homes remain within their communities. The estimated proportion and number of children in each type of care who were removed from their family and from their community is shown in Table 2-2.

Table 2-2 **Share and number of children removed from their family and from their community by care type (2006-2020)**

Share removed from their family and from their community	%	#
Kinship[12]	8%	1,000
Foster[13]	76%	27,900
Institutional and Group Homes[14]	84%	3,900
Total removed from their home, family and community		***32,700***

Source: PBO based on 2016 Census and 2011 Census and ISC's CFS IMS
Note: See endnotes for assumptions and calculations. For foster care, institutional care and group homes, these proportions reflect the share of children placed off-reserve, either in their initial placement or in a subsequent placement. Some First Nations may consider some off-reserve placements with families sharing the same Aboriginal identity to be placements within the child's community. In the 2011 National Household Survey, 21 per cent of First Nations foster children living off-reserve lived with at least one First Nations foster parent.[15]

2.3. Reason for removal

Of those children who were removed from their home, family, and community, the estimated breakdown of reasons for removal is shown in Table 2-3 below. Two-thirds of children, roughly 22,000, were removed for reasons other than abuse. They are analyzed together because they cannot be distinguished based on caseworker-reported reasons for removal; both children and parents would be eligible for compensation in almost all cases.[16]

Table 2-3 **Share and number of children removed from home, family and community by primary reason for removal (2006-2020)**

Primary reason for removal	%	#
Abuse	33%	10,700
Reasons Other than Abuse	67%	22,000
Total		***32,700***

Source: PBO based on custom analysis of First Nations Component of the 2008 Canadian Incidence Study of Reported Child Abuse and Neglect (FNCIS 2008).

Note: The breakdown was based on the primary reason for removal as recorded in the FNCIS 2008. Exposure to intimate partner violence (the primary reason for removal in 8 per cent of removals)[17] and emotional maltreatment (3 per cent) were classified as removals due to abuse. Multiple factors are often present in a removal. For example, poverty and substance abuse may be factors in a removal due to abuse. This breakdown is based on caseworker's primary classification of the reason for removal which focused on the type of maltreatment rather than underlying causes.

2.4. Necessity and prevention services

Families with children removed for reasons other than abuse are entitled to compensation only if:

- The child was "unnecessarily apprehended"; and
- The family "especially in regards to substance abuse, did not benefit from prevention services in the form of least disruptive measures or other prevention services permitting them to remain safely in their homes, families and communities." [18]

The PBO considered seven possible scenarios for how these criteria might be applied. (The scenarios are outlined in Appendix A.) Under these possible scenarios, the proportion of otherwise eligible families who would be excluded from compensation would range from 0 per cent to 85 per cent. In other words, at the upper bound, all 22,000 eligible children removed for reasons other than abuse would receive compensation, compared with only 3,300 at the lower bound.

2.5. Parents

Parents of children removed due to abuse are not entitled to compensation; however, parents who had a child removed for reasons other than abuse are entitled to compensation.[19] To be eligible for compensation, the parent must have been caring for the child at the time of the child's removal.

Grandparents are eligible for compensation only if the parents were absent and the children were in their care.[20] The term parent was not defined by the Tribunal. However, the PBO assumes that it includes step-parents and adoptive parents, including parents under customary adoptions not formalized by court order.

Children who were removed from their homes have a second in-home caregiver in 47 per cent of cases.[21] So, it is assumed that there are 1.47 eligible caregivers per child. No limitation was applied with respect to the relationship between the in-home caregiver(s) and child, so this includes adoptive parents and step-parents acting as in-home caregivers.

The number of parents who are eligible depends on the number of children who are eligible for reasons other than abuse. This number of children is affected by the extent to which children are excluded because their removal was necessary or their family received preventative services.

If none are excluded, 22,000 children would be removed for reasons other than abuse. This implies that 32,400 parents would be eligible for compensation.

If 85 per cent are excluded, 3,300 children would be removed for reasons other than abuse. This implies that 4,900 parents would be eligible for compensation.

2.6. Compensation

According to the CHRT ruling, each eligible parent and child would receive $40,000 plus applicable interest.[22]

Again, compensation depends on the extent to which children are excluded because their removal was necessary or their family received preventative services.

If no children are excluded, this would result in $1,309 million in pre-interest compensation for the 32,700 eligible children, and $1,295 million in pre-interest compensation for the 32,400 eligible parents.

If 85 per cent are excluded, this would result in $564 million in pre-interest compensation for the 14,100 eligible children. For the 4,900 eligible parents, the pre-interest compensation would amount to $194 million.

The range of estimated compensation is shown in Table 2-4.

Table 2-4 **Summary of the number of children and parents eligible and associated compensation costs**

	Upper Bound		Lower Bound	
	Children	**Parents**	**Children**	**Parents**
# Eligible	32,700	32,400	14,100	4,900
Pre-interest compensation per eligible person	40,000	40,000	40,000	40,000
Pre-interest compensation ($ millions)	$1,309	$1,295	$564	$194
Interest on compensation ($ millions)	$340		$99	
Total cost of compensation ($ millions)	$2,944		$857	

All figures represent the costs up to the end of 2020. Additional costs will continue to accumulate after that time, including interest and compensation in relation to ongoing removals. By the end of 2025, the expected cost would reach $3.7 billion under the 0% scenario.

2.7. Differences in assumptions

The PBO's estimate relies on factual and legal assumptions that differ substantially from those used in ISC's preliminary cost estimate and eligibility criteria proposed by other parties.

Children already in care in 2006

About 8,500 children were in care as of 1 January 2006. The PBO assumes these children are eligible.[23] ISC's preliminary estimate assumes they are not eligible.

Adjustment factor

ISC's preliminary estimate of 48,200 children coming into care for the first time up to the end of 2017-18 is significantly higher than the PBO's estimate of 36,400 children. This is due to an adjustment factor ISC applied in projecting backwards children in care prior to 2014. ISC found that indexing to point-in-time counts underestimated the number of children coming into care relative to administrative data kept by three regions and grossed up its backwards projections accordingly. The PBO chose not to apply a similar

adjustment factor because we could not verify the methodology used by those regions and ISC could not provide us with the regional data.

Children off-reserve

The Chiefs of Ontario argued in recent submissions that "in Ontario, the Compensation Entitlement Order should apply equally to First Nations persons on or off reserve."[24]

The PBO did not adopt this approach because the Tribunal's order is explicitly limited to "First Nations children living on reserve and in the Yukon Territory." Ontario has 182,890 off-reserve individuals who identify as First Nations, just under half of the 380,355 persons on-reserve in all of Canada.[25]

Children placed within their extended family or community

In its written representations on its application for judicial review, ISC defines the eligible group as "every child removed from their home, temporarily or long-term, and every caregiving parent or grandparent to that child, unless they abused the child or children."[26]

Under this interpretation, all children removed from their homes are entitled to compensation, even if they were placed with family or within their community. This is the approach taken in ISC's preliminary estimate. If these children who were placed within their extended family or community were included, it would roughly double the number of eligible children.

Children placed in informal care

ISC's preliminary estimate is based on its child expenditure records. Thus, it implicitly excludes compensation for children removed from their homes and placed in unfunded kinship care where no expenditure would be recorded. Children in unfunded care are not relevant to the PBO's estimate because these children are all placed within their family or community and are thus ineligible for compensation.

However, under the definition set out in ISC's written representations, these children placed in unfunded care would appear to be eligible, even though they are not included in ISC's preliminary estimate. Since 49 per cent of all children removed from their homes are placed in informal kinship care, including these children would roughly double the cost of complying with the order.[27]

Prevalence of abuse

ISC's preliminary estimate assumes that 40 per cent of parents are ineligible because they abused their child. This assumption was made on the basis that 40 per cent of aboriginal respondents reported experiencing childhood physical and/or sexual abuse in a 2015 survey. (An alternative scenario showed 20 per cent of parents ineligible due to abuse.)[28]

The PBO obtained access to the First Nations Component of the Canadian Incidence Study of Reported Child Abuse and Neglect 2008; it showed that 33 per cent of children taken into care on-reserve were the result of abuse. As noted above, the PBO assumes that parents of children removed due to abuse are not eligible even if they did not abuse their child.

Unnecessary removal and non-benefit from prevention services
ISC's preliminary estimate does not incorporate any further inquiry into whether a child's removal was unnecessary or whether their family benefited from preventative services allowing the child to remain in the home.

Number of parents and eligibility of grandparents
With respect to factual assumptions, ISC's preliminary estimate assumes that each child has two eligible caregivers. Based on the First Nations Component of the Canadian Incidence Study of Reported Child Abuse and Neglect 2008, the PBO estimates that removed children have an average of 1.47 in-home caregivers.

It is not clear whether ISC's interpretation of the Tribunal's decision requires the parents to be absent for grandparents to receive compensation. If caregiving grandparents are eligible irrespective of whether the parents of the child are absent, the number of eligible grandparents could be much higher.

The Chiefs of Ontario argued in recent submissions that "the reality of families in First Nations communities means that aunties, uncles and other family members may well have been caring for children at the time of removal, and submits that such people should not be precluded from entitlement to compensation."[29]

The Tribunal rejected this approach, stating: "While the Panel does not want to diminish the pain experienced by other family members such as other grand-parents not caring for the child, siblings, aunts and uncles and the community, the Panel decided in light of the record before it to limit compensation to First Nations children and their parents or if there are no parents caring for the child or children, their grand-parents."

The PBO's estimate is based on compensation for up to two in-home caregivers irrespective of their relationship with their child, so it is not strictly limited to biological parents. However, it would exclude the broader family and community providing care and companionship to a removed child.

Interest calculation
ISC's estimate includes compound interest at the Bank of Canada Policy Rate with unspecified adjustments, whereas the PBO estimate includes simple interest at the Bank of Canada's Bank Rate consistent with the default under section 9(12) of the CHRT *Rules of Procedure*.[30]

The decision nominally awards compensation at the Bank of Canada Rate. However, given the absence of any rationale for deviating from the Tribunal's rules of procedure, the PBO assumes the Tribunal intended to award compensation at the slightly higher Bank of Canada Bank Rate.

Resolution date

ISC's estimates also explore the implications of it taking until 2025-26 to resolve the claim. Under that scenario, ISC's preliminary cost estimate rises to $6.7 billion. The PBO's estimate rises to $3.7 billion under the scenario where all children removed from their home, family, and community for reason other than abuse are eligible.

Impact of assumptions

It seems reasonably clear that ISC's interpretation as set out in court filings deems children placed within their extended family or community to be eligible. It does not incorporate any further inquiry into whether a child's removal was unnecessary or whether their family benefited from preventative services allowing the child to remain in the home.

However, ISC's interpretation is unclear with respect to two of the other most consequential differences in assumptions, specifically:

1. The eligibility of children placed in unfunded care, and
2. The eligibility of caregiving grandparents where the parents are not absent.

If children placed in unfunded care are excluded and the grandparents of children in the care of their parents are excluded, the cost under ISC's interpretation is estimated to be $4.8 billion. Including children placed in unfunded care and four caregiving grandparents per child, the cost under ISC's interpretation would be $22.8 billion.

If proposals to compensate children off-reserve in Ontario were accepted by the Tribunal, the cost would increase by about 50 per cent. Compensating all relatives of a child who provided care to a removed child would result in an indeterminable, but likely large, increase in the cost.

3. Comparative cost of settling a class action

The Government of Canada (hereafter referred to as "Canada") has publicly indicated that it intends to compensate families entitled to compensation under the CHRT order through a settlement of a class action. This could be *Xavier Moushoom and Jeremy Meawasige v. The Attorney General of Canada* or a similar class action recently filed by the Assembly of First Nations.

Canada cannot void the CHRT's order simply by settling a class action. So, the framing of a class action settlement as an alternative to complying with the CHRT decision still relies on Canada having that order quashed through judicial review. If the CHRT order was paid out, Canada has argued that any compensation awarded under the CHRT order would be offset against damages awarded in a class action.[31]

It appears that eligibility for compensation under either class action could be broader in terms of three factors: the time period covered; the relatives entitled to compensation; and the eligibility of families of children removed due to abuse.

However, there may be barriers to the success of a class action. Federal funding for child welfare differs dramatically between provinces, between agencies, and over time. Families differ in the prevention services they received, the reasons their child was taken into care, and where their child was placed. Responsibility for removals and the circumstances leading to removals are shared among many parties.

To establish a clear relationship between an action for which the federal government is liable and harm suffered by the plaintiffs, it may be necessary lawyers representing the plaintiffs to dramatically limit the scope of who is eligible for compensation, or the harm for which they are being compensated. For example, in the *Sixties Scoop* class action, the group eligible for compensation was limited to children who were placed in non-aboriginal foster homes, and only included compensation for loss of culture.[32]

In terms of the amount of compensation, previous class action settlements regarding the removal of children from their homes, families and communities suggest that compensation for each removed child would not necessarily be any more than the $40,000 maximum awarded by the CHRT. The amounts awarded in previous similar cases are shown in Table 3-1.

However, individuals who suffered exceptional harm as a result of their removal, such as children who suffered abuse while in a foster home, could potentially receive much more if an individualized assessment process is implemented. An example of that would be the process used for the Indian Residential School Settlement.

The scope of eligibility and amount of compensation are negotiated and are, therefore, difficult to predict.

Table 3-1 Summary of compensation awarded in previous similar cases

	Common experience payments	Individualized compensation	Differences
Indian Residential Schools Settlement (2006)	$10,000 for the first year, $3,000 for subsequent years, averaging $20,457 ($25,900 in 2020 dollars) for emotional abuse, loss of family life, loss of language/culture, etc.	38,178 claims out of 105,530 claimants with awards averaging $111,265	Longer average duration, more abuse
Sixties Scoop Settlement (2017)	Likely <= $25,000, solely for loss of cultural identity	Not settled	Generally permanent

Appendix A – Possible interpretations of further restrictions

Families with children removed for reasons other than abuse are entitled to compensation only if:

- The child was "unnecessarily apprehended" and
- The family "especially in regards to substance abuse, did not benefit from prevention services in the form of least disruptive measures or other prevention services permitting them to remain safely in their homes, families and communities."

The CHRT's decision does not clearly explain how these eligibility criteria are supposed to be applied. Seven possible approaches were considered, including:

- Canada-wide approaches,
- province-year specific approaches,
- group-by-group analysis of the presence of factors or services, and
- group-by-group causal analysis.

The 0 per cent to 85 per cent range reflects the possible exclusions under these interpretations.

Among these possible approaches, the most likely interpretation is that the CHRT's eligibility criteria require a further group-by-group assessment of whether each child was unnecessarily removed. The evidence would be that they did not benefit from prevention services which would have permitted them to remain at home.

The assessment would not be the extent of harm, which the Tribunal rejected as harmful and unnecessary. Rather, it would be whether the harm associated with a child's removal arose from the underfunding of preventative services.

One factor that supports the interpretation that an additional group-by-group assessment is required is that the evidence summarized by the CHRT and the conclusions it drew accept the existence of unnecessary removals, but do not address the prevalence of unnecessary removals.

In summarizing the evidence, the CHRT states that the least disruptive measures to address neglect are underfunded, and that "without funding for [the] provision of preventative services many children […] are unnecessarily removed from their homes and families."[33]

The necessity of a case-by-case assessment is further supported by the reference to substance abuse in the CHRT order. The CHRT appears to be making some attempt to define a population it expects to be found ineligible as a result of a further assessment.

It does so when it restricts eligibility to families who "especially in regards to substance abuse, did not benefit from prevention services in the form of least disruptive measures or other prevention services permitting [the children] to remain safely in their homes, families and communities."[34]

This suggests that removals due to caregiver substance abuse, where the caregiver benefited from prevention services intended to allow the child to remain in the home, do not give rise to compensation. The term "especially" suggests that families benefiting from prevention services may be excluded in other circumstances. Determining whether caregivers benefited from prevention services intended to allow the child to remain in the home requires a case-by-case assessment.

Another important contextual factor is that the order was issued in response to a request by the Assembly of First Nations (AFN) to establish an expert panel to determine appropriate case-by-case compensation. This proposal was not just for a case-by-case assessment of individual damages, which the Tribunal rejected as harmful and unnecessary. It was also to determine whether preventative services would have prevented abuse leading to a child's removal.[35]

Canada-wide approaches

Under these approaches, no children are screened out and no case-by-case assessment is required.

Scenario 1: Reliance on finding of systemic discrimination

A taxonomy of compensation category proposed by the First Nations Child and Family Caring Society (FNCFCS) argues that a prior CHRT ruling "found that First Nations children living on-reserve were discriminated against by the Canadian government in part because they did not receive adequate prevention services." [36] On this basis, the taxonomy appears to accept that all children did not benefit from prevention services. This would result in no cases being screened out.

Scenario 2: Reliance on placement outside of family and community

Alternately, the Tribunal could reason, as it did in relation to cases of abuse, that all First Nations children should have been placed within their family and community. If the Tribunal does not entertain evidence that equitable funding to find and support such placements was in place or that an equitable level of such placements occurred, this would result in no cases being screened out (the PBO's cost estimate already excludes placements with family and community).

Province-year specific approach

Under these approaches, children are screened out depending on the province and year in which they were taken into care.

Scenario 3: Removals in province-years where funding for prevention services was in place

The eligibility criteria ask specifically about whether a family benefited from prevention services. Canada has been incrementally providing funding for prevention services on a province-by-province basis in an attempt to address the systemic discrimination identified by the Tribunal.

For about 85 per cent of removals for which compensation has been ordered, prevention services were funded under a bilateral agreement or the enhanced prevention focused approach. This suggests that if children are screened out in province-years for which the additional funding for prevention services was in place, as much as 85 per cent of cases could be screened out.

Group-by-group and case-by-case analysis of the presence of factors

Under these approaches, the Tribunal or delegated body would determine, or has determined, that children removed in certain circumstance are eligible. Then it would consider whether each case falls within an eligible group.

Scenario 4: Removals related to poverty, housing, or substance abuse

The FNCFCS's taxonomy has an eligibility requirement asking whether the child experienced neglect related to poverty, housing and substance abuse. This is in conflict with the wording of the CHRT order, which includes neglect as a parallel ground. However, in this way, the taxonomy indirectly restricts eligibility to those found to be harmed in the Wen:de reports prepared by the First Nations Child and Family Caring Society of Canada.

Those reports speak of neglect related to poverty, housing and substance abuse as circumstances where removals are potentially preventable.[37] In this way, looking at whether a removal was related to poverty, housing or

substance abuse may be a reasonable proxy for determining the circumstance where removals are potentially preventable in the view of the CHRT.

To assess the impact of this approach, the PBO requested a custom tabulation from the First Nations Component of the 2008 Canadian Incidence Study of Reported Child Abuse and Neglect. That custom tabulation shows that this approach would only slightly restricts eligibility, as poverty, housing and substance abuse were a suspected or confirmed factor in 94 per cent of investigations resulting in placements outside the home.

Table A-1 **Presence of risk factors among investigation resulting in an out-of-home placement for First Nations on-reserve children, as reported by caseworkers**

	%
Unsafe housing conditions	23%
Home overcrowding	10%
Household income only from social assistance, EI, other benefits, or none	54%
Household ran out of money for necessities within the past six months	19%
Suspected or confirmed drug or alcohol abuse by caregiver	84%
Any of above risk factors	94%

Source: PBO based on custom analysis of FNCIS 2008.

Scenario 5: Exclusion of substance abuse cases

The decision indicates that the exclusion related to benefit from prevention services applies especially with regard to cases of substance abuse. The particular emphasis placed on substance abuse in the context of the availability of prevention services mirrors earlier quotes from the Wen:de reports. These quotes express the view that where treatment services were available, continuing substance misuse lies within the personal domain for change.[38]

First Nations addiction treatment centres and community-based prevention programs are offered at various locations across Canada.[39] Without a clear definition and further data, it cannot be determined whether these services were adequate and available in the context of a particular removal. If the

assessment were to screen out all families where caseworkers flagged suspected or confirmed substance abuse, 84 per cent of families could be excluded.

Group-by-group and case-by-case causal analysis

If the CHRT requires evidentiary proof that prevention funding would have averted the removal of a group of children on a balance of probabilities, the outcome will depend on the evidence accepted and the scope of least disruptive measures and prevention services the CHRT believes should have been provided.

Scenario 6: Causal analysis based on ISC definition of preventative services

The types of "prevention services" funded by Canada over most of the relevant period were non-medical services delivered to families, such as education, counselling and intensive in-home supports.[40] Between 2007-08 and 2013-14, Canada increased funding for prevention services under an "Enhanced Prevention Focused Approach" (EPFA).

However, it was not possible to identify a distinct group of children who are no longer coming into care as a result of the EPFA. In the decade since implementation of the EPFA began, the number of children in ISC-funded care has increased in some provinces with EPFA funding, while decreasing in others.

In total, the number of children in care increased 18 per cent in provinces with EPFA funding, whereas the number of children in care decreased 9 per cent in the remaining provinces and single territory (Yukon).

However, excluding kinship care, the number of children in care in EPFA provinces with EPFA funding is estimated to have decreased 25 per cent. Beyond the absence of a clear aggregate impact, it is difficult to identify a causal relationship for a variety of other reasons.[41]

Based on experiences over the last decade with EPFA funding, it would be difficult to prove that the removal of any particular group of children would not have occurred with adequate funding for prevention services.

Academic literature is inconclusive regarding the effectiveness of prevention services. Several types of home visitation programs have been found to reduce child maltreatment or maltreatment risk factors in some cases; but, in other cases the same or similar programs have not been effective or even increased maltreatment.[42] Such results may also not be generalizable to First-Nations on-reserve families and few studies look at impacts on probabilities of being taken into care. Even where effective, these programs only reduce the probability of a child being taken into care. It would still be difficult to say

that any particular family would not have been taken into care if the intervention had been in place. It is difficult to predict what conclusions the CHRT would draw from such a mixed body of research.

Scenario 7: Causal analysis based on broader definition of preventative services

Under a broader definition of preventative services, there do appear to be services which could reduce the number of children removed from their homes, families and communities. Specifically, funding to find and support kinship placements and foster care on-reserve, funding for housing and income assistance could avoid the removal of some children. It might even be possible to show that the removal of a particular family's child could have been prevented if the child was removed from to their home due to poverty, unsafe housing, or if a family member would have been willing and able to take in a child if more support was available.[43] However, for many cases of neglect, it would be difficult to point to any particular program that would have prevented the removal of a child.

Notes

1 *First Nations Child & Family Caring Society of Canada et al. v. Attorney General of Canada (representing the Minister of Indigenous and Northern Affairs Canada)*, 2019 CHRT 39.

2 As set out in 2017 CHRT 35, Jordan's Principle relates to the approval of and reimbursement for government services for First Nations children. Where a government service is available to all other children, the government department of first contact must pay for the service. Where a service is not necessarily available to all other children, the government department of first contact must evaluate the needs of the child to determine whether the requested services should be provided to ensure substantive equality or culturally appropriate services, or to safeguard the best interests of the child. The CHRT decision orders compensation to be paid to each First Nations child who "was denied services or received services after an unreasonable delay or upon reconsideration ordered by this Tribunal." The parents or grandparents of those children are also eligible for compensation.

3 Compensation will be paid to caregiver grandparents only if the parents were absent. 2019 CHRT 39 at para 185.

4 Written Representations of the Applicant/Moving Party on Motion to Stay at para 9; Affidavit of Cindy Blackstock at p 117 (Page 5 of Exhibit 12) [FNCFCS taxonomy]; Assembly of First Nations (AFN), Compensation Order / Questions and Answer.

5 CHRT, Letter of 16 March 2020.

6 Among other issues, the Application for Judicial Review challenges the Tribunal's decision to award individual compensation in a case of systemic discrimination, its decision to award individual compensation in light of a lack of evidence proper funding could have prevented all removals, and the amount of compensation awarded in the case of short temporary removals. Attorney General of Canada, Written Representations of the Applicant/Moving Party on Motion to Stay.

7 This differs from the approach taken by the FNCFCS's taxonomy, which limits eligibility to children who have, or are eligible, for Indian Status. Eligibility is not expected to be restricted to Status Indian children because:

- The decision refers to First Nations children rather than "Status Indian" children;
- Canada has jurisdiction over lands reserved for Indians; and
- Underfunding of on-reserve prevention services would negatively affect all children on-reserve. irrespective of their status.

The definition of a First Nations child is an open issue being considered by the CHRT.

[8] Because kinship care was not distinguished in ON, MB, and YK for the entire period, point-in-time counts for the number of children in kinship care in ON, MB, and YK were interpolated based on provinces that distinguished kinship care. Interpolated kinship placements were deducted from foster placements.

[9] Quebec and the Atlantic provinces include placements with family within foster placements in some circumstances. This error also effects the result for Ontario and Manitoba due to interpolation for these provinces. In addition, and possibly as a result, the share of children in non-kinship foster care is higher than found in the First Nations Component of the Canadian Incidence Study of Reported Child Abuse and Neglect, where non-kinship foster care accounted for 53 per cent of placements with expenditures. As defined in the FNCIS 2008, kinship foster care includes all formal placements arranged within the family support network, including placements with extended family and in customary care.

[10] Expenditures have only been nationally tracked at the child level since 2013, meaning children entering care for the first time can only be identified for 2014 onwards. The number of children taken into care for the first time prior to 2014 was estimated based on indexing the number of children taken into care for the first time in 2014 by care type to point-in-time counts of the number of children in care by care type. The 2014 base year only excluded children in care in 2013. So this approach may overestimate the number of unique children who were taken into care to the extent there are recurrent placements with a gap of more than one year between placements. If this were common, one would expect to see a decline in unique children coming in care for the first time since 2014, which has not occurred.

[11] This differs from the approach taken by the FNCFCS taxonomy and by Indigenous Services Canada, which both ask whether children were removed from their "homes, families, or communities." That would result in compensation being paid to children placed within their family or community. See: Affidavit of Sony Perron at para 5; Attorney General of Canada, Written Representations of the Applicant/Moving Party on Motion to Stay at para 9; Affidavit of Cindy Blackstock at p 117 (Page 5 of Exhibit 12).

The PBO interprets the decision to only compensate children removed from their family and community because:

- The decision uses the word "and" rather than "or";
- The references to families and communities would be redundant if all children removed from the home qualified;
- The panel's corresponding factual finding is that "removing a child from its family and community is a serious harm" (paras 161, 169, 184);
- Similar wording specifying that compensation is for children "placed in care outside of their extended families and communities" (para 249) is used with respect to abused children. The CHRT had earlier found that

abused children "should have been placed in kinship care with a family member or within a trustworthy family within the community" (para 149). This suggests that the CHRT believes no wrong was done in cases where a child was placed with a family member outside of the child's community or a non-family member within the child's community.

12 Over a 3-year period, a study Perry et al. found 13.6% of children placed in kinship care were moved to another family or group. Gretchen Perry, Martin Daly and Jennifer Kotler, Placement stability in kinship and non-kin foster care: A Canadian study (2011).

It was assumed subsequent placements had an equal probability of being non-kinship placements. Children moved to non-kinship placements were assumed to have an equal probability of being placed off-reserve as a child directly placed in a non-kinship placement.

13 Based on ISC data, the PBO estimated the number of First Nations children in ISC-funded non-kinship foster care in 2016. Based on 2016 Census data, the PBO could determine the number of children in non-kinship foster care on reserve. The probability of any particular placement being on-reserve for each province was assumed to be equal to the percentage of these children ISC funded care who were in care on reserve. The number of subsequent placements for First Nations children was derived from Quebec administrative data. An expected probability of being placed on reserve in any placement was calculated using the Quebec distribution of number of placements and each province's probability of being placed off-reserve for each placement. That probability was weighted based on the provincial distribution of children in care to produce a national probability of being placed on reserve in any placement.

The key assumptions in this approach are:

- All First Nations children placed in foster care on-reserve came from homes on-reserve,
- The duration of time in care for placements on-reserve is similar to the duration of placements off-reserve and,
- The probability of a subsequent placement being off-reserve is independent of the probability of the initial placement being off-reserve.

ISC, Response to PBO IR0437; Statistics Canada, Aboriginal Population Profile, Census 2016. First Nations of Quebec and Labrador Health and Social Services Commission: Trajectories of First Nations youth subject to the Youth Protection Act COMPONENT 3: Analysis of mainstream youth protection agencies administrative data.

14 The estimated share of children placed in group homes is based on the number of Status Indians in residential care facilities (which includes group homes) on-reserve based on the 2016 Census, as a percentage of the number of children who had been in group homes for 6 months or longer as of census day based on ISC's CFS IMS. This assumes that individuals residing in the group home less than six months would have been recorded at their ordinary residence and there is no significant difference in the duration of

group home placements on and off reserve. An expected probability of being placed on reserve in any placement was calculated using Quebec distribution of number of placements for placements in group homes and institutions.

Institutions are generally distinguished from group homes by capacity. Given the low total number of children in residential care facilities in any province, it was deemed unlikely that there were any children in institutional care on reserve. The figure presented represents the weighted average of the two figures.

ISC, Response to PBO IR0437; Statistics Canada, Custom Tabulation based on 2016 Census; Tonino Espositoa, Nico Trocmé et al., The stability of child protection placements in Québec, Canada 42 Children and Youth Services Review (2014) 10-19.

15 Statistics Canada, Living arrangements of Aboriginal children aged 14 and under (2016).

16 There may be rare cases in which a child is removed for reasons other than abuse, poverty, poor housing, neglect, or substance abuse, or in order to receive services. For example, a child could be taken into care because the parents are unable to care for them for other reasons, such as illness, death or incarceration.

17 The order elaborates on abuse as including sexual, physical and psychological abuse (2019 CHRT 39 at para 256). The term psychological abuse is not actually defined in provincial child welfare legislation. But the most comparable definitions of 'emotional injury', 'emotional harm', 'psychological ill-treatment' typically all include exposure to family violence (See Affidavit of Cindy Blackstock at p 196, Page 84 of Exhibit 12). This is not to say that the victim of intimate partner abuse abused their child by exposing their child to intimate partner violence. However, the abused parent is nevertheless not eligible because their child was necessarily removed due to abuse by the perpetrator of intimate partner violence. There is no order of compensation that covers even innocent parents of children removed due to abuse.

The primary reason for removal differs from the prevalence because multiple factors may be present in a particular case. As reported by caseworkers in cases where children were removed, 39 per cent of caregivers were victims of intimate partner violence, while 31 per cent of caregivers were perpetrators of intimate violence. This was the case even though intimate partner violence was the primary reason for removal in only 8 per cent of removals.

18 2019 CHRT 39 at para 245.

The PBO assumes the order for compensation is to be limited to those groups found to be harmed as described within the order. This is the approach taken by the FNCFCS taxonomy, but not the approach taken by ISC. ISC appears to read each order as not limited by the preceding findings of harms. Despite the lack of a demonstrative pronoun indicating this

restriction, the orders are assumed to be limited to those found to be harmed because:

- The explicit purpose of the decision is to compensate children and caregivers harmed by discriminatory underfunding of child protection services, so one would expect compensation to be limited to those found to be harmed;
- The identical orders made in paragraph 245 (regarding neglected children) and 249 (regarding abused children) would be redundant if not limited to the groups found to be harmed;
- Without being restricted to those found to be harmed, the order would include First Nations children residing off-reserve, who receive services funded by provincial governments;
- In further restricting eligibility to children who "especially in regards to substance abuse, did not benefit from prevention services [...] permitting them to remain safely in their homes, families and communities", the Tribunal is excluding a group of households.

The order appears to accept that the fact an abused child was placed in care outside of their extended families and communities is sufficient proof that an abused child did not benefit from prevention services. This flows from the use of the phrase "and therefore, did not benefit from prevention services". This implies that the Tribunal is finding, as a matter of fact, that removed abused children placed outside their families and communities did not benefit from prevention services. The Tribunal made this factual finding explicit earlier in its reasons at paragraph 149. The word 'therefore' was not used in the corresponding order regarding removals for reasons other than abuse.

Although the CHRT uses the term "apprehended" in English, it uses the term "placés" in French and "removed" in the heading and later in the same paragraph. This suggests the term is not being used in a precise legal sense to limit eligibility to children apprehended by children's aid societies to the exclusion of children voluntarily placed in care. Voluntary placements in care account for about 6 per cent of placements in care. Even if excluded on this ground, they would likely be eligible on the basis their child was taken into care in order to receive essential services.

19 As written, the decision would not compensate parents of children removed due to abuse even when the parent was not the perpetrator of the abuse. Specifically, the decision explicitly excludes caregivers who abused their children (para 256). However, the decision also does not include a positive order to compensate the parents of children necessarily removed due to abuse. For physical abuse, the only category for which a sufficient sample size was available, the primary caregiver was the perpetrator in 97 per cent of cases, and a secondary caregiver the perpetrator in 3 per cent.

39 ISC, National Native Alcohol and Drug Abuse Program.

40 ISC, National Social Programs Manual 2012 at § 4.4.2. ISC, Mid-Term National Review for the Strategic Evaluation of the Implementation of the Enhanced Prevention Focused Approach for the First Nations Child and Family Services Program at § 1.2.1 ["Prevention services may include, but are not limited to, respite care, after-school programs, parent/teen counselling, mediation, in-home supports, mentoring and family education, in accordance with services similarly offered by the province of residence off reserve."];.ISC, Program Directive: Prevention/Least Disruptive Measures (Draft).

41 Many other changes occurred over the decade. The count of children in care may be affected by expansions in funding eligibility for kinship and customary care placements. In addition, significant prevention funding may have been diverted towards other purposes, including intake services, which can increase the number of children taken into care. ISC does not know how much prevention funding was actually spent on prevention services.

According to a survey of agencies by the IFSD, 12 per cent of federal funding was used for prevention services. IFSD, Enabling Children to Thrive, Figure 36.

A. Purpose

1. This is a joint expert report prepared by experts separately retained by the plaintiffs and defendants in the matter of Xavier Moushoom and the Attorney General of Canada (the "**Moushoom Matter**").

2. Peter Gorham is president and actuary with JDM Actuarial Expert Services Inc. He regularly provides actuarial consulting services as well as actuarial expert testimony. He is a fellow of the Canadian Institute of Actuaries and of the Society of Actuaries. He received his Actuarial Fellowship in 1980 and has provided pension, benefits and actuarial consulting services for approximately 42 years. A copy of his curriculum vitae is attached as Appendix 1.

3. Prof. Nico Trocmé is the Director of the School of Social Work and the Philip Fisher Chair in Social Work at McGill University. He has been leading studies on Canadian provincial and First Nations child welfare services since the early 1990s and has authored over 200 scientific publications based on this research. He has acted as a child welfare policy and program consultant to several provincial governments and First Nations organizations and has presented expert evidence at various inquests and tribunals. A copy of his curriculum vitae is attached as Appendix 2.

4. Our work was greatly enhanced through the contributions and insights provided by Marie Saint-Girons, Research Assistant, Centre for Research on Children and Families, McGill University. She currently supports the coordination of the First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect 2019 (FN/CIS-2019), a national study examining the overrepresentation of First Nations children in the child welfare system across Canada. A copy of her curriculum vitae is attached as Appendix 3.

5. We understand and acknowledge that as experts, we have a duty to provide evidence in this proceeding as follows:

   a. to provide opinion evidence that is fair, objective and non-partisan;

   b. to provide opinion evidence that is related only to matters that are within our area of expertise; and

   c. to provide such additional assistance as the court may reasonably require, to determine a matter in issue.

6. We acknowledge that the duty referred to above prevails over any obligation that we may owe to any party by whom or on whose behalf we are engaged. Copies of Form 53 acknowledging those duties are attached as Appendix 7, Appendix 8, and Appendix 9.

7. The purpose of this report is to assist counsel for the plaintiffs and counsel for the defendants in their exploratory discussions by providing various estimates of the number of First Nations children who were taken into care in Canada between 1 April 1991 and 1 March 2019 and who remained in care for various specified durations. We were specifically requested:

   a. to the extent possible, provide separate estimates of the number of children who were taken into permanent care and those taken into non-permanent care;

   b. to the extent possible, provide estimates of the number of children based on total time in care using six-month intervals; and

   c. provide summary statistics of the average time in care based on age at entering care and age at leaving care.

8. The data to which we had access did not readily permit splitting the number of children between temporary and permanent care. We have therefore only presented estimates of the total number of children who were taken into care as well as the number of children in care based on six-month intervals of total time in care.

9. The intended users of this report are the two parties to this matter together with their respective counsel. This report is not suitable nor intended in its current form to be filed with the courts. The report should not be provided to anyone who is not an intended user except as may be required by law. The findings herein should not be relied upon by any party other than an intended user.

B. Background

10. In 2018, Canada settled a number of class actions regarding First Nations children who had been taken into care between 1951 and 31 March 1991 (the "**Sixties Scoop**").

11. An expert report was prepared by Gorham for purposes of settlement discussions in the Sixties Scoop matter (the "**Gorham Report for Sixties Scoop**"). That report set out the estimated number of First Nations children that entered care in each fiscal year 1951 to 1990.

12. The Moushoom Matter covers First Nations children who ordinarily live on reserve and who were taken into care between 1 April 1991 and 1 March 2019.

13. The Moushoom Matter also includes issues related to Jordan's Principle. This report does not cover any aspect of the allegations involving Jordan's Principle. This report is solely focussed on providing an estimate of the number of First Nations children who ordinarily live on reserve and who were taken into care between 1 April 1991 and 1 March 2019.

14. Trocmé and Gorham were requested by plaintiff's and defendant's counsel to work together in reviewing available information and preparing a preliminary estimate of the class size in the Moushoom Matter. We met numerous times via online conference call to review and discuss the data and the methodology to be used in preparing our estimate. Most of our work was focussed on two key items, the care models to be used and analysis of data to prepare a distribution of duration in care for First Nations children.

Status of Children in Care

15. We were asked to provide an estimate of the number of children taken into permanent care and those taken into other than permanent care.

16. The data maintained by Indigenous Services Canada ("**ISC**") differentiates between three types of status of children in care – permanent, voluntary and temporary.

17. Most of the data that we had available for analysis does not indicate the status of the children in care. The data on children in care beginning 1 April 2013 does provide the status of care for each child. However, we were advised by ISC that the status of the child in care is entered into the system by the childcare worker assigned to the child and is not verified. Consequently, the status is believed to be susceptible to errors. ISC was unable to provide any indication of the extent of such errors.

18. Since we had very little data about the type of care by children, we have not split the estimates of children entering care by temporary, voluntary and permanent. If requested, we could provide that information based on an assumption that the split by type of care in 2013 to 2018 is the same split that applied prior to 2013.

Data for First Nations Children in Care

19. We were provided with **aggregate data** from ISC showing

    a. the total number of First Nations children ordinarily resident on reserve in care as of 31 March in each year from 1970 to 1977, 1981 and from 1992 to 2017; and

    b. the total number of care days in each fiscal year from 1969-70 to 2016-17 with the exception of 2012-13.

20. Unless otherwise specified, whenever we refer to a year, we are referring to the fiscal year starting on April 1st of that year.

21. Because a child that is in care for five years will be included in the data at least five times, one cannot simply add these numbers together to get the total number of children in care during the class period 1 April 1991 to 1 March 2019. Consequently, we created a model to follow children through their time in care. By adding up the estimated number of children that entered care in each year, we determined an estimated total number of children in care during the period 1991 to 2019.

22. ISC also provided us with three sets of **data files regarding individual children in care**. This data was used to determine a distribution of time in care and of ages entering and leaving care for First Nations children.

    a. The **Ontario Data** provided information about each First Nations child in care in Ontario for each fiscal year (1 April to 31 March) 2000, 2002, and 2004 to 2012. That data included information about children who first entered care prior to 2000 and who were in care in any of the above years. There is no information about the status of children in care.

    b. The **BC Data** provided information about each First Nations child in care in British Columbia from April 2011 to August 2019. The data includes children who entered care for the first time prior to 2011 and who were in care at any time on or after April 2011. The status of children in care is included for some of the children.

    c. The **Canada Data** provided information about each First Nations child in care in all provinces and territories beginning 1 April 2013. This data showed the first and last dates that an expense had been submitted for a specific child between 1 April 2013 and 31 March 2018 as well as the status of children in care.

C. The Care Models

23. We created three care models: the Duration Model, the Status of Children in Care Model and a Mean Estimation Model. Each one models the children's time in care from their entry into care until they exit care.

24. The purpose of each model is to estimate the number of children that enter care. The total of the children entering care is the estimated class size.

25. The Duration Model is the one we considered provided the best and most reliable estimates and the one we used for presenting results in this report. The other two models were utilised as a check on the reasonableness of the Duration Model.

The Duration Model

26. The Duration Model does not consider the status of children in care. This model only considers the time in care statistics that we developed from the Ontario and Canada Data (see paragraphs 69 -79).

27. For this model, we cannot just start modelling from 1991. We need to develop a distribution of the children in care as of 1 April 1991 for the model to work.

28. Consequently, we started with the children in care in 1970. We assumed that the distribution of children by duration in 1971 was approximately similar to the duration we determined for 2000 to 2005. Having an accurate distribution for 1970 is not necessary, as any errors will have worked their way out of the projections by 1991.

29. From 1970 to 1990, the children were modelled moving through care every six-months in the same way as described in paragraphs 81 to 83. In this manner, the number entering care in each year 1970 to 1990 was determined and they formed the basis of the 31 March 1991 distribution of children by time in care – from newly entered to 21 years in care.

30. The Duration Model looks at each six-month period separately. Every six months, children are moved through care.

    a. Some of the children who entered care during the prior period leave care. The rest are moved to the category 6 – 12 months in care.

    b. Some of the children who had been 6 to 12 months in care during the prior period leave care and the rest are moved to the category 12-18 months in care.

    c. This process is repeated for each six-month category until all the children that were in care in the prior period have either left care or moved to the next category.

d. At this point, the number of children who remain in care are added together and compared with the total number that were reported to have been in care. The difference is the number entering care during that period.

31. The main assumption used for the Duration Model is the distribution of time in care – the probability that a child will exit care during a specified six-month period.

The Status of Children in Care Model

32. The Status of Children in Care Model was developed from the Care Model utilised in the Gorham Report on Sixties Scoop. That model split the total number of children in care in each year between an assumed number in permanent care and the balance in non-permanent care (called temporary care in the Gorham Report on Sixties Scoop). The children in permanent care were then modelled using assumptions about time in care to produce an estimate of the number of children entering permanent care in each year. No modelling was performed, or required, of the children in temporary care for purposes of the Gorham Report on Sixties Scoop.

33. For the Status of Children in Care Model, we first allocated the total number of children in care in each year between those assumed to be in permanent and temporary care.

34. An initial distribution of children by the number of years in temporary care was developed in the same manner as described in paragraphs 27 to 29. An initial distribution of children in permanent care based on their age was developed by assuming the distribution was the same as produced by the Sixties Scoop model for 1990-91. An initial distribution of children in voluntary care based on their age was produced by assuming the same distribution applied to them as for those in permanent care.

35. The children assumed to be in temporary care were modelled using a process similar to the Duration Model described above.

36. The children assumed to be in permanent or voluntary care were modelled using a similar process, but based on their age rather than the time in care.

Mean Estimation Model

37. Based on the analysis of the Ontario Data, we determined the mean time in care by year as well as the median and decile breaks for time in care.

38. The Mean Estimation model applied the average number of days in care to the total days in care for all children to give a very rough estimate of the total number of children.

Summary

39. Both the Status of Children in Care Model and the Mean Estimation model were used solely for the purpose of a reasonableness check of the results from the Duration Model.

40. Results from the Status of Children in Care Model and the Mean Estimation model are not used other than as a reasonableness check and are not reported on herein. All results contained in this report are based on the Duration Model.

D. Data Review and Analysis

41. We reviewed each of the data files for reasonableness and completeness having regard to the nature of our work. Complete accuracy is not required since we are dealing with thousands of children and small errors will disappear in the rounding. In particular, an error that is material on an individual basis is unlikely to affect the results within the overall group of children. However, systematic errors could become material if not adequately addressed.

Total Children in Care by Year

42. We reviewed the number of First Nations children in care as of 31 March in each year 1991 to 2018 at both the national level and the regional levels.

    a. We confirmed that the national totals are the sum of the regional totals.

    b. We reviewed the changes in the numbers from year to year for reasonableness. Anomalous regional patterns in year-to-year changes are discussed below and highlighted in italic and in yellow in tables 48a and 48b.

43. **Atlantic Region**: There was a significant increase in the number of children in care between 2004 and 2006 from 623 to 1,085. That total then declined by 2008 to the previous levels. Assuming no error in those numbers, the change in the total number of care days during that period suggests the spike was over a few months and was for children who remined in care for a very short period of time.

44. **Quebec Region**: The number of children in care as of 31 March increased from 814 in 2001 to 1,084 in 2005. The number decreased to 593 in 2006 before returning to historic levels in 2007 and later years. There was no significant change in the total number of care days during that period. There appears to be an error in either, or both, the count of children as of 31 March and the number of care days during the years 2002 to 2005. We are unable to determine either an appropriate correction or a reasonable explanation for these numbers. Depending on which data are incorrect, our use of these numbers may cause an overstatement in the estimate of class size.

45. **Manitoba Region**: The number of children in care on 31 March increased gradually from 1,551 in 2004 to 2,517 in 2010 and then remained at that level. The total number of care days also increased over that period, leading us to conclude that these numbers are likely accurate.

46. **Saskatchewan Region:** The number of children in care on 31 March increased from 1,123 in 2006 to 2,124 in 2007 and then returned to historic levels in 2008. There was also a less dramatic one-year increase of 150,000 in the total number of care days. We

were unable to determine if this represents a short period with a significant increase of children taken into care or if it is a one-year error in reporting. We have utilised the numbers as shown which, if there was a reporting error, may result in overstating the estimated class size.

47. **Alberta Region:** The number of children in care increased from 905 in 1992 to 1,587 in 1995 and then decreased for two years before increasing to 1993 in 2000. The total care days moved in a similar manner, leading us to conclude that these numbers are likely accurate.

48. Table 48a shows the number of children in care as of 31 March in each year by region. Table 48b shows the total number of care days in each fiscal year. The highlighted and italicised numbers are those discussed above.

Table 48a – First Nations Children in Care as of 31 March in Each Year

Year	Atlantic	Quebec	Ontario	Manitoba	Saskat-chewan	Alberta	BC and Yukon	National
1991	-	-	-	-	-	-	-	-
1992	283	488	1,323	1,382	470	*905*	607	5,458
1993	216	557	668	1,337	383	*1,119*	551	4,831
1994	239	508	492	1,276	285	*1,527*	527	4,854
1995	273	420	472	1,318	411	*1,587*	643	5,124
1996	327	567	733	1,203	357	*1,268*	844	5,299
1997	366	626	670	1,064	536	1,381	697	5,340
1998	390	615	747	1,317	765	1,583	803	6,220
1999	491	737	931	1,270	951	1,895	945	7,220
2000	572	782	1,048	1,363	980	1,993	1,024	7,762

49. We recommend that the data issues discussed above for the Atlantic, Quebec and Saskatchewan Regions be investigated by ISC in an attempt to explain these significant changes or find correct numbers.

Child Level Data

50. In addition to the aggregate annual totals described above, we received and reviewed three data files including more detailed child-level data.

51. The data we received included one or both name and First Nation registration number. For our work, the name and registration number were deleted and replaced by a random ID code.

Ontario Data

52. The Ontario data includes one record per First Nations child for each fiscal year they were in care.

53. The Ontario Data provided us with the means to follow children from their first entry into care through to their final exit from care. We were able to distinguish between children in continuous care and those who had multiple periods of care. For most of the children in care at the end of the Ontario Data (31 March 2013), we were able to match them up with their information in the Canada Data and thereby extend the period of time in care we could analyse.

54. In reviewing the Ontario Data, we identified a number of errors that we were able to correct satisfactorily in most cases.

    a. Some dates of birth were clearly wrong and in most situations there were other records for the child with a correct date of birth.

    b. For each fiscal year, there were about 60 children for whom no date of exit was included and there were no records for that child in subsequent years. On inspection, we concluded that they had most likely exited care during that year and we estimated an exit date by using a random number. The distribution of assumed exit dates was uniform throughout the year. For children who were in their first or second year of care, this would likely result in a small overstatement of the time in care. In our opinion, this is not material for the purposes of the report.

    c. For fiscal year 2001, there was no data available.

        i. We assumed that a child in care at the end of fiscal year 2000 who was also in care at the beginning of 2002 had remained in care continuously throughout 2001. That may overstate the time in care for any children who left and returned to care in 2001.

        ii. Children who entered care in 2001 and who remained in care in 2002, could be identified in the 2002 data. The 2002 data included their most recent date of entry and we assumed that they had remained in care continuously from their

entry to the end of 2001. That may overstate the time in care for any children who left and returned to care in 2001.

iii. There were about 400 children who had no exit date in the 2000 data and who were not in care in 2002. We assumed that about 60 of them had left care during the 2000 fiscal year and no exit date had been entered and that the balance had left care during the 2001 fiscal year. We used random numbers to estimate their exit dates.

iv. There are an unknown number of children who both entered and exited care during the 2001 fiscal year. We have no data for them. Consequently, we did not use the data for any children who entered care in 2001 for any of our analyses of overall duration in care. We were able to use those who entered care in 2001 for a separate analysis of children who were in care for over 12 months.

d. For fiscal year 2003, there was no data available. We made similar assumptions as described above for 2001.

e. About 200 registration numbers were found to have been used for multiple children. For about 150 of those, we were able to determine that the children were from the same family and the registration number appeared to be a temporary number. We assumed that these were for children that had not been registered under the Indian Act and we created unique numbers for each of those children. For about 50 of those, the children with the same registration number appeared to be from different families. For a few of the numbers, there were as many as four different children with the same registration number. We created unique numbers for each of these children.

f. There were about 50 registration numbers where the child's name was the same or similar and the date of birth was different and did not appear to be a typing error[1]. We assumed that these were different children and created unique ID numbers for them.

g. In matching up the Ontario Data with the Canada Data, we found 274 children who were in care on 31 March 2013 in Ontario and for whom there is no exit date but they do not appear in the Canada Data. Upon inspection, we found 232 of those children are in the Canada Data but with a different registration number. We adjusted the ID numbers for them so their data could be combined between the two

[1] For example, 2-3-2002 and 2-3-2005 would likely be a typo if the rest of the information between two records matches. However, 2-3-2002 and 14-8-2003 is much less likely to be a typing error even if the rest of the information is similar.

datasets. For the remaining 42 children, we assumed that they left care during the 2012 fiscal year and we estimated an exit date using random numbers.

55. We compared the number of children in care as of each 31 March based on the Ontario Data with the Total Children in Care reported for Ontario. The numbers are sufficiently close as to be considered equal.

56. After cleaning the Ontario Dataset, there were 8,693 unique children in the sample. Information on gender was missing for 9.4% of the children. For those with gender identified, 49.3% are female and 50.7% are male.

BC Data

57. The BC Data did not add sufficient years of information to be useful for our analyses to date.

Canada Data

58. The Canada Data has one record per First Nations child with information about dates that expenses were submitted for the child. The date of the first expense submitted on or after 1 April 2013 is included and the date of the most recent expense submitted before 1 April 2018. However, we were informed that the data for 1 April 2013 to 31 March 2018 could be incomplete as new information is added and existing information may be modified by the regions.

59. There is little we can do for data checking given the format of the data. As discussed above at paragraph 54.g, we did find 232 children where the registration numbers from the Ontario data in fiscal year 2012 and the registration numbers in the Canada Data were different.

60. We also found 18 cases where there were two records for the same child. After cleaning the Canada dataset, there were 25,686 unique children in the sample. Information on gender was missing for 0.8% of the children. For those with gender identified 49.9% are female and 50.1% are male.

61. The Canada Data has no information about date of entry to or exit from care. The only information is with respect to expense amounts and dates.

    a. We assumed that a child who had no expense during the period 1 April 2013 to 31 March 2014 was entering care for the first time as of the date of their first expense unless data about that child was included in the Ontario dataset.

b. We assumed that a child for whom the first expense was prior to 1 April 2014, might have entered care at any time prior to 1 April 2014 and that we could make no assumption about how long they had previously been in care.

c. We assumed that a child who had no expense after 30 March 2018 had left care as of the date of the last expense.

d. We assumed that a child for whom there was an expense after 30 March 2018 may have left care or may remain in care as of 1 April 2018 and, with the exception of a subset of children in the Ontario data discussed below (paragraph 70), we could make no assumption about how long they have or may spend in care after 31 March 2018.

Applicability of the Data to the Class

62. The results of our work are only useful to the extent that the children included in the data we used match the children included in the class definition. If the data about total number of children in care includes children that are not First Nations and/or do not ordinarily live on reserve, then the estimates we have determined from the data will not be for the same definition as applies in the Moushoom Matter.

63. We were advised by ISC that the three data files include only First Nations children who were ordinarily resident on reserve.

64. The results presented in this report are based on an assumption that:

a. the data includes only First Nations children that ordinarily live on reserve;

b. all First Nations children that ordinarily live on reserve and who were taken into care during the time periods of the data are included in the data;

c. all First Nations children who were placed in foster care, kinship care, group homes, and institutional care are included;

d. the data does not include children who were placed in informal kinship programs;

e. the data about duration in care as developed from the Ontario Data is representative of the duration in care for all of Canada.

65. The maximum age of eligibility for care differs by province. During the class period, the maximum age has changed in some provinces. The duration statistics we have used herein is based on the Ontario maximum age for the class period. Differences by province from time to time in the maximum age for care could affect the results. We do not have sufficient data to be able to determine how much of an effect that may have on the results.

66. We note that the data for 2013 to 2018 only include children for whom an expense was submitted. To the extent that there may be children who did not have an expense paid by Canada during this period, such as children in informal kinship care arrangements, they are not included in our estimates.

67. In both the Ontario and the Canada datasets, despite the correction described above, we found further inconsistencies in the child ID codes. Mismatched ID codes meant that two episodes in care experienced by the same child would be counted as two different children placed in out-of-home care. Mismatched ID codes leads to overestimating the number of children, and underestimating cumulative time spent in care. We corrected for those mismatches that we were able to detect by using other identifying information.

68. We also found that entry and exit dates did not always match information about numbers of days in care. While we were able to correct some of these inconsistencies, we suspect that we were unable to correct for all of them. We assume that the days in care numbers, which are most directly associated with payments, are accurate but that there remain errors with some entry and exit dates. Class size and time in care estimates rely therefore on the assumption that the days in care data are accurate. The entry and exit date inconsistencies primarily affect out ability to examine patterns of multiple placements; we therefore were not able to pursue such analyses as fully as we had hoped.

Analysis

69. We looked at the children who entered care for the first time in fiscal year 2000, 2002, and 2004 in Ontario and for each child determined the total time in care. Given that we were able to merge the Ontario and Canada datasets, we had information on these children until at least 13 years after their first entry.

70. Some of the children who remained in care at the end of the Ontario Data and who we were able to follow within the Canada Data, appeared to remain in care as of 31 March 2018 (subject to comments in paragraphs 58 to 61 above). For those children remaining in care as of 31 March 2018, we assumed the following using a normal distribution:

    a. Those that had been in care for more than half of their life since first entering care, would remain in care continuously until they reached the average age for leaving care, based on the averages and standard deviations described below (paragraph 71).

b. Those that had been in care for less than half of their life since first entering care are assumed to have either reached a point where they will remain in care continuously until they reach the average age for leaving care or they will remain in care proportionate to their past time in care. Combining those assumptions, we estimated the remaining time in care by assuming these children would on average be in care for half of the future time up to the average age for leaving care.

71. We calculated the average age at which children exit care by time since first entry in care for cohorts that had spent more than 13 years in care as shown in Table 71. Note that this is the total time since first entry and not the actual time in care.

Table 71 – Average Age of Leaving Care

Total Years Since First Entered Care	Average Age Leaving Care	Standard Deviation Age Leaving Care
17 or more	19.5	1.0
15 or more	19.1	1.4
13 of more	18.6	1.9

72. Having made the above estimates of future time in care, we had a series of data that we could analyse to determine the distribution of time in care for children in the Ontario and Canada datasets. In particular, this would include information on those who remain in care for the longest periods.

73. The number of moves in and out of care could not be calculated in a systematic manner from the datasets provided. Most of the children for whom we have data had not reached their maximum age for care by the final year of data. However, we were able to estimate which children were continuously in care and which children had more than one period of care on the basis of available entry and exit dates relative to the total number of days in care reported by ISC. For the 2000-2004 entry cohorts examined:

a. About 62% of the children appeared to have been continuously in care – that is, only one period of care. On average, they were in care for 19 months with a median time in care of 5 months[2].

b. The rest of the children (38%) were assumed to have multiple periods of time in care.

[2] The median is the value where half of the children were in care for less time and half in care for more time. A median of 5 months means that 50% of the children who were in care continuously, left care on or before five months and 50% remained in care longer than seven months.

74. We analyzed the percentage of children leaving care after 4.5 years or more in care and found that the rates do not vary significantly between the 2000-2004 entry cohorts examined.

75. We also looked at children who entered care for the first time between 2006 and 2010 as well as those we deemed had entered care for the first time in fiscal year 2014 and 2015. We found that, although there was some variability in the percentage of children who leave care within the first few years after entry between fiscal years 2000, 2002 and 2004, the percentages do not vary significantly between the cohorts with subsequent years of first entry.

76. We concluded that:

a. we could use the average calculated cumulative percentages of children leaving care after 5 years from the 2000-2004 entry cohorts examined to estimate the equivalent percentages for children who entered care for the first time between 2005-2010.

b. we could use the average calculated cumulative percentages of children leaving care after 18 months from the 2000-2010 entry cohorts examined to estimate the equivalent rates for children who we deemed had entered care for the first time in 2014 and 2015.

Time in Care Statistics

77. Table 77 presents the results of the analysis of the Ontario and Canada Data with respect to the rate at which First Nations children leave care based on the total time in care. Children with more than one period in care are included based on the actual number of months in care excluding any time not in care. For example, a child that spent 18 months in care over a five-year period is included as 18 months.

Table 77 – Percent of First Nations Children Who Have Exited Care by Months in Care

Total Months in Care	Year First Entered Care										
	2000	2002	2004	2005	2006	2007	2008	2009	2010	2014	2015
6	36.8%	41.8%	44.2%	43.4%	40.2%	47.4%	44.2%	39.9%	39.4%	43.3%	41.8%
12	51.7%	55.8%	58.9%	60.9%	53.0%	59.5%	58.8%	52.6%	55.5%	59.4%	59.2%
18	64.1%	65.0%	67.0%	68.0%	62.0%	65.1%	65.6%	63.0%	65.2%	67.9%	68.5%
24	70.4%	70.0%	73.8%	75.6%	68.6%	69.9%	70.8%	68.5%	72.4%	73.8%	
30	74.2%	73.6%	76.0%	78.6%	70.6%	72.7%	76.9%	71.6%	76.5%		
36	76.8%	77.1%	78.5%	81.0%	74.4%	75.6%	80.4%	75.3%	80.6%		
42	78.6%	79.5%	80.6%	82.6%	78.0%	77.7%	83.3%	77.5%	82.1%		
48	80.7%	80.9%	83.9%	84.0%	79.8%	78.7%	84.4%	81.0%	84.6%		
54	82.1%	81.5%	85.9%	85.5%	80.8%	80.2%					
60	83.9%	83.6%	86.5%								

72	86.4%	86.3%	87.6%
84	88.2%	87.8%	89.4%
96	89.8%	90.5%	91.2%
108	90.8%	91.7%	91.9%
120	92.3%	93.1%	92.8%
132	93.4%	93.7%	93.4%
144	94.6%	94.1%	94.1%
156	95.5%	94.8%	94.7%
168	96.0%	95.7%	95.4%
180	96.8%	97.3%	96.5%
192	97.4%	97.7%	97.2%
204	98.4%	98.2%	98.1%
216	99.1%	98.5%	99.1%
228	99.7%	98.9%	99.4%
240	99.8%	99.0%	99.4%
252	100.0%	100.0%	100.0%

78. We did not calculate time-in-care statistics for 2011 to 2013 as the timeframe was too short.

79. However, we did calculate the statistics for 2014 and 2015 since these were the only years for which we had data for all regions of Canada. Our primary purpose was to see if there was any noticeable difference between the time-in-care for the earlier years for Ontario and the time-in-care for all of Canada. We concluded that it is likely that Ontario time-in-care statistics are reasonably similar to those for all regions of Canada.

80. Further analysis of the data is contained in Appendix 6.

E. Assumptions

Duration Model

81. The Duration Model starts with the distribution of children by time in care as of 1 April 1991. That distribution was developed by starting with children entering care in 1970 and modelling them through to 1991.

    a. The total number of children in care as of 31 March in each year was assumed to be equal to the counts provided by ISC for those years in which a count was provided (1971 to 1977 and 1981). For the other years, the number was estimated based on the total number of care days in the year, as provided by ISC, divided by 365, together with an adjustment. The adjustment was based on the relationship between total care days and number of children in care on 31 March in the years for which both numbers were available. Those are the same number of children in each of those years as used in the Status of Children in Care Model and in the Gorham Sixties Scoop Report.

    b. The children in care as of 1 April 1970 were distributed by time in care based approximately on the average distribution from 2000 to 2004. Any errors in that distribution will likely have worked their way out of the data by 1991.

    c. Children were modelled moving through care using the duration assumptions and methods described below (paragraph 82 to 83).

    d. The number of children entering care in each fiscal year 1970 to 1990 was calculated so the total number of children in care in each year matched the number as reported by ISC.

    e. By the time the model reaches 31 March 1991, all of the durations from newly entered through to 21 years in care have been populated with numbers of children in care.

82. The Duration Model looks at each 6-month period separately.

    a. The number of children who exit care in each six-month period is calculated based on the total number who originally entered care multiplied by the percentage of those children who are assumed to leave care during that six-month period.

    b. The number of children who remain in care is calculated to be equal to the number that were in care in the prior six-month period, minus the number that exited care.

    c. Once the number of children remaining in care has been determined for each duration from 6-months to 20-years, the number entering care is calculated to be

the total number of children assumed to be in care for that period minus the number that remain in care from prior periods.

83. The rate at which children exit care was assumed to vary over time, recognising that policies and practices for care were subject to change. The rates that we assumed were based on the results of our data analyses and in particular the Time-in-Care statistics presented above (Table 77).

a. The Time-In-Care statistics for 2005 to 2010 were only valid for the first 5 years of time in care. For periods of five-years and longer, we assumed that the average of the percentages from 2000 to 2004 applied.

b. The Time-In-Care statistics for 2014 to 2015 were only valid for the first 24 months and 18 months respectively of time in care. For the longer periods, we assumed that the average of the percentages from 2000 to 2010 applied.

c. We did not have complete data for years prior to 2000. We made approximate assumptions for the percentage of children exiting care by duration for 1991 and 1970. We reviewed the results for various assumptions and determined that there was little difference in results between assuming (1) the 2002 rates applied for all years prior to 2000 and assuming (2) rates that we extrapolated from the post-2002 rates.

d. Having developed a table of duration in care for each year of entry from 2000 to 2015, the rates were then averaged in three-year groupings, resulting in an average rate for 2002, 2006, 2010 and 2015. For years prior to 2002, the 2002 rates were used. For the intervening years, rates were interpolated on a linear basis. For years after 2015, the 2015 rates were used.

Table 83 – Assumed Rates of Exiting Care by Duration

	Percent of Children Entering Care by Year That Exit by Total Months in Care			
Months	**2002**	**2006**	**2010**	**2015**
6	40.9%	43.7%	41.2%	42.6%
12	55.5%	57.8%	55.6%	58.6%
18	65.4%	65.0%	64.6%	67.2%
24	71.4%	71.3%	70.6%	72.1%
30	74.6%	74.0%	75.0%	74.6%
36	77.5%	77.0%	78.8%	77.8%
42	79.5%	79.4%	80.9%	80.1%
48	81.8%	80.8%	83.3%	82.1%
54	83.2%	82.2%	84.0%	83.2%

	Percent of Children Entering Care by Year That Exit by Total Months in Care			
Months	2002	2006	2010	2015
60	84.7%	84.7%	84.7%	84.7%
72	86.8%	86.8%	86.8%	86.8%
84	88.5%	88.5%	88.5%	88.5%
96	90.5%	90.5%	90.5%	90.5%
108	91.5%	91.5%	91.5%	91.5%
120	92.7%	92.7%	92.7%	92.7%
132	93.5%	93.5%	93.5%	93.5%
144	94.2%	94.2%	94.2%	94.2%
156	95.0%	95.0%	95.0%	95.0%
168	95.7%	95.7%	95.7%	95.7%
180	96.9%	96.9%	96.9%	96.8%
192	97.4%	97.4%	97.4%	97.4%
204	98.2%	98.2%	98.2%	98.2%
216	98.9%	98.9%	98.9%	98.9%
228	99.3%	99.3%	99.3%	99.3%
240	99.4%	99.4%	99.4%	99.4%
252	100.0%	100.0%	100.0%	100.0%

Adoptions

84. We were provided with information about the number of adoptions of registered First Nations children in Canada. We assumed that all children who were adopted were first in either temporary or permanent care and were included in the data that was provided about children in care. Therefore, we have not estimated the number of adoptions, as all those children are already included in the estimates.

Summary

85. This technique of following children through their years of care should not be taken as suggesting greater accuracy than another method. We utilised this method to reflect the year-by-year fluctuations of children in care and how that could impact on actual duration of care. In the absence of additional information about average years of care, we believe that this method gives better results than simply making an assumption about the average years of care of all children during the period 1991 to 2018.

86. The use of these models explicitly recognises that the number of children in care fluctuated – in some years greatly – and that fluctuation has an impact on the determination of the number of unique children.

Survivorship to 2019

87. To estimate survivorship to 2019, we utilised Canadian population mortality tables from 1971 through to 2016 (the most recent such table available from Statistics Canada). These were combined into a series of cohort tables based on year of birth.

88. The Canadian population mortality was adjusted to reflect differences in mortality between all Canadians and First Nation Canadians. Mortality rates were projected from 2016 to 2019 using a standard projection to recognise ongoing improvements in mortality. The process is described in Appendix 5.

89. The result is a series of mortality rates that reflect the changes in First Nation peoples' mortality year by year during the period 1971 to 2019. By combining these mortality rates, we developed a table of survivorship percentages which gives the percent of children who were born in years from 1971 to 2018 and who are expected to have survived to 2019.

Table 89 - Survival Rates to 2019

Year of Birth	Year of Entering Care					
	1991	1996	2001	2006	2011	2016
1976	93.8%					
1981	95.4%	95.7%				
1986	96.6%	96.8%	97.0%			
1991	96.6%	97.8%	97.9%	98.1%		
1996		97.7%	98.7%	98.8%	99.0%	
2001			98.5%	99.4%	99.5%	99.7%
2006				98.9%	99.8%	99.9%
2011					99.1%	100.0%
2016						99.2%

90. The survivor percentages were applied to each group of children entering care based on the year of entry and assuming that they were on average aged 5 when entering care.

F. Changes from January 2020 Preliminary Report

91. In our preliminary report dated 11 January 2020, we had estimated a class size of about 136,000 children. In this report, our estimate is approximately 30,000 fewer children.

92. We had also noted that our estimates for children entering care from 2015 to 2019 were approximately 2,000 higher than the estimate obtained from an analysis of the Canada Data.

93. In the investigation of this, we found an error in the model that resulted in more children leaving care than was correct based on the assumptions. That resulted in more children entering care under the model.

94. We had also raised issues about the data and some anomalies we noted – most of which remain outstanding with this report. We examined the data further and found about 250 children where errors in the data had resulted in a child being treated as two or in a few situations, three different children.

95. In correcting those errors, the average duration in care was increased, reducing the number of children leaving care in each year and reducing the number of children assumed to enter care. Because of the multiplicative effect of taking about twelve years of data from Ontario and using it to apply to 28 years for all of Canada, this resulted in a large portion of the 30,000 decrease in our estimate.

G. Class Size Estimates

96. Based on the data from 1991 to 2019 regarding adoption and foster care of First Nation Canadians who normally reside on reserve, the number of unique children was estimated using the Duration Model.

97. These estimates are for children who first entered care on or after 1 April 1991. Any child who entered care for the first time prior to 1 April 1991 was excluded from these estimates.

98. Based on the results of our modelling, we estimate that the number of registered Indian children ordinarily resident on reserve[3] who were taken into care from 1 April 1991 to 31 March 2019 is between 90,000 and 120,000.

99. In our opinion, it is likely that the number of such children is between 100,000 and 110,000.

100. These estimates are based on the results produced by the Duration Model. As we change the assumptions, the results change. We noted that the results usually lay between 100,000 and 110,000 under various assumptions.

101. Using the assumptions that we have detailed within this report, the Duration Model estimated a total of 106,200 registered Indian children normally resident on reserve entered care from 1 April 1991 to 31 March 2019.

102. The Duration Model made no distinction between children by the status of care. The following table shows our estimate of registered Indian children normally living on reserve who entered care between 1 April 1991 and 31 March 2019, broken down by the length of time in care. We estimate 106,200 children were in care of whom 43,600 exited care with between 0 and 6-months total time in care and the balance of 62,600 were in care for at least 6 months. Of those, 15,400 exited care with between 6 and 12-months total time in care and the balance of 47,200 were in care for at least 12 months.

[3] Registered Indian children include all First Nation children with status under the Indian Act as well as children with at least one parent who has status under the Indian Act and who normally lives on reserve.

Table 102 – Children in Care – 1 April 1991 to 31 March 2019

Number of Months	Number in Care at Least x Months	Survived to 2019	Deceased by 2019	Number Leaving in Period	Survived to 2019 for Leaving
0 months	106,200	105,100	1,100	43,600	43,200
6 months	62,600	61,900	700	15,400	15,200
12 months	47,200	46,700	500	10,600	10,500
18 months	36,600	36,200	400	6,100	6,000
24 months	30,500	30,200	300	4,400	4,400
30 months	26,100	25,800	300	3,500	3,400
36 months	22,600	22,400	200	3,000	2,900
42 months	19,600	19,500	100	2,300	2,300
48 months	17,300	17,200	100	1,700	1,700
54 months	15,600	15,500	100	1,400	1,400
60 months	14,200	14,100	100	2,400	2,400
72 months	11,800	11,700	100	-	-

103. We were requested to split the above table between those who entered care from 1 April 1991 to 23 February 2006 and those entering care from 24 February 2006 to 31 March 2019.

Table 103a – Children in Care – 1 April 1991 to 23 February 2006

Number of Months	Number in Care at Least x Months	Survived to 2019	Deceased by 2019	Number Leaving in Period	Survived to 2019 for Leaving
0 months	56,600	55,600	1,000	23,800	23,400
6 months	32,800	32,200	600	8,400	8,300
12 months	24,400	23,900	500	5,100	4,900
18 months	19,300	19,000	300	3,600	3,500
24 months	15,700	15,500	200	1,500	1,500
30 months	14,200	14,000	200	1,800	1,800
36 months	12,400	12,200	200	1,000	900
42 months	11,400	11,300	100	1,400	1,400
48 months	10,000	9,900	100	600	600
54 months	9,400	9,300	100	1,000	1,000
60 months	8,400	8,300	100	1,100	1,100
72 months	7,300	7,200	100	-	-

Table 103b – Children in Care – 24 February 2006 to 31 March 2019

Number of Months	Number in Care at Least x Months	Survived to 2019	Deceased by 2019	Number Leaving in Period	Survived to 2019 for Leaving
0 months	49,600	49,500	100	19,800	19,800
6 months	29,800	29,700	100	7,000	6,900
12 months	22,800	22,800	-	5,500	5,600
18 months	17,300	17,200	100	2,500	2,500
24 months	14,800	14,700	100	2,900	2,900
30 months	11,900	11,800	100	1,700	1,600
36 months	10,200	10,200	-	2,000	2,000
42 months	8,200	8,200	-	900	900
48 months	7,300	7,300	-	1,100	1,100
54 months	6,200	6,200	-	400	400
60 months	5,800	5,800	-	1,300	1,300
72 months	4,500	4,500	-	-	-

H. Certification

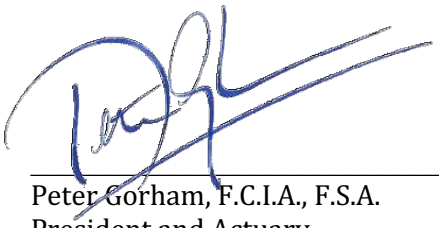
104. We hereby certify that:

a. in our opinion, subject to the comments made in this report, the data used is sufficient and reliable for the purposes of the report;

b. in our opinion, the methods employed are appropriate for the purposes of this report;

c. in our opinion, the assumptions used are, in aggregate, appropriate for the purposes of the work; and

d. there are no subsequent events other than those discussed in this report that we are aware of that would have an impact on the results presented herein.



Peter Gorham, F.C.I.A., F.S.A.
President and Actuary
JDM Actuarial Expert Services Inc.

Nico Trocmé, MSW, PhD, TS, FRSC
Director, School of Social Work
Philip Fisher Chair in Social Work
McGill University

Marie Saint-Girons, MSW
Research Assistant, Centre for Research on Children and Families
McGill University, School of Social Work

18 January 2021

Appendix 1 Curriculum Vitae of Peter Gorham, F.S.A, F.C.I.A.

Position & Responsibilities

Peter is the President and Actuary of JDM Actuarial Expert Services Inc. (JDM Actuarial). He provides pension and actuarial consulting advice, expert testimony, retirement planning and governance services.

Areas of Specialization

Peter has provided expert advice and testimony to the legal profession since 1987. His experience includes determining:

- certification of criminal rates of interest,
- lost benefits for wrongful dismissal,
- the present value of future income and future care costs,
- valuation of life estates,
- present value of future trust plan benefits and present value of past funds under various possible investment scenarios,
- present value of future contingent events.

In the past, Peter has also provided expert evidence for:

- family law pension valuations.

He has provided expert testimony to the Supreme Court of British Columbia, Court of Queen's Bench of Alberta, Court of Queen's Bench of Manitoba, the Ontario Superior Court of Justice, La Cour Supérieure du Québec, the Ontario Unified Family Court, the High Court of Justice of Trinidad and Tobago, the Supreme Court of Bermuda, Ontario Employment Standards Tribunal, Ontario Workplace Safety and Insurance Tribunal, Canada Human Rights Tribunal and the Canadian Institute of Actuaries Disciplinary Tribunal.

Within the pension and actuarial consulting practice, Peter's main areas of expertise include the design, financing, administration and governance of pension and benefit plans. His strengths lie in providing innovative and workable solutions that address a client's needs. He is effective in communicating actuarial concepts in simple and understandable terms.

Peter is an experienced public speaker and an author of numerous articles related to pensions and benefits.

Background

Peter is an actuary, receiving his fellowship in 1980. He attended the University of Toronto, graduating with a B.Sc. in Actuarial and Computer Sciences. Prior to founding JDM Actuarial in 2011, Peter spent 13 years as a partner at Morneau Shepell, and prior to that, 20 years with Aon Consulting, (formerly MLH + A inc), serving clients in the area of pension and employee benefits.

Professional & Other Affiliations

Fellow of the Canadian Institute of Actuaries
Fellow of the Society of Actuaries
Faculty, Humber College PPAC program
Past-President, Rotary Club of Whitby Sunrise

Appendix 2 Curriculum Vitae of Professor Nico Trocmé, M.S.W., Ph.D., R.S.W., F.R.S.C.

Academic & Professional Positions

Director, School of Social Work, McGill University (2014-present)
Full Professor, School of Social Work, McGill University (2005-present)
Full Professor, Faculty of Social Work, University of Toronto (2004-2005)
Associate Professor, Faculty of Social Work, University of Toronto (1998-2004)
Assistant Professor, Faculty of Social Work, University of Toronto (1993-1998)
Research Fellow, Institute for the Prevention of Child Abuse (1992-1993)
Teaching Assistant & Lecturer, Faculty of Social Work, University of Toronto (1988-1992)
Social Worker, Sacred Heart Child and Family Services Outpatient Family Therapy (1987-1988)
Social Worker, Children's Aid Society of Metropolitan Toronto (1984-1987)

University Education

Ph.D., University of Toronto, Faculty of Social Work, 1992
Master of Social Work, University of Toronto, Faculty of Social Work, 1983
Honours Bachelor of Arts, University of Toronto, Trinity College, 1981

Research Expertise

Professor Trocmé is one of Canada's leading experts on child welfare systems and policies. He is the principal investigator for the Canadian Incidence Study (CIS) of Reported Child Abuse and Neglect (1993, 1998, 2003 & 2008), the lead researcher for a Federal-Provincial-Territorial initiative to develop a common set of National Outcomes Measures in child welfare, directs the Canadian Child Welfare Research Portal (cwrp.ca), and is conducting a research capacity development and knowledge mobilization initiative involving child welfare and First Nations service provider agencies in Quebec.

Professor Trocmé is the author of over 200 scientific publications, has been awarded 25 million dollars in funding through grants, contracts and gifts, and has mentored a new generation of Canadian child welfare scholars.

Professor Trocmé has acted as a child welfare policy and program consultant to several provincial governments and First Nations organizations and has presented expert evidence at various inquests and tribunals.

Professional & Other Affiliations

Fellow of Royal Society of Canada
Registered Social Worker, Ordre des travailleurs sociaux et the thérapeutes conjugaux et familiaux du Québec
International Society for the Prevention of Child Abuse and Neglect (ISPCAN)

Appendix 3 Curriculum Vitae of Marie Saint-Girons, M.S.W.

Position & Responsibilities	Marie is a researcher at the Centre for Research on Children and Families at McGill University's School of Social Work. She currently supports the coordination of the 2019 cycle of the First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect (FN/CIS-2019), which documents the overrepresentation of First Nations children in the child welfare system.
University Education	Master of Social Work, McGill University, Faculty of Social Work, Montreal, 2018 Honours Bachelor of Science in Psychology, University College London, London, UK, 2013
Areas of specialization	Marie has contributed to a number of studies and reports aimed at describing First Nations child welfare in Canada. She has, amongst other things, acted as a liaison between researchers and First Nations representatives in each province, communicated with over a hundred First Nations child welfare agencies across Canada, provided on-site trainings to Indigenous child welfare workers, produced briefs explaining the legislative and funding policies shaping First Nations child welfare by jurisdiction, and collected data to track the number of First Nations children in the child welfare system throughout the country. She has also helped produce a taxonomy of compensation categories for First Nations families following the 2019 CHRT 39 ruling. Her other areas of specialization include the field of cross-cultural psychiatry and complex trauma. Marie has provided mental health services to immigrant and refugee families in agencies across Montreal.

Appendix 4 **Documents Utilised**

1. The following documents and data were provided to us for use in preparing this report. A number of the data files containing information about individual children also contained personal identification information – name, date of birth and registration number. That information was necessary for data verification work and for establishing a link between the various files of information – so that we could follow each child from date of first entry to are up to the most recent exit from care. Once data verification had been completed by Gorham, the personal identification information (name and registration numbers) were replaced by a unique ID number that was randomly generated, so that the data files no longer contained information that could identify an individual. It was that anonymised file that was shared with Trocmé and Saint-Girons for purposes of the work in preparing this report.

    a. Statement of Claim in the matter of Xavier Moushoom and the Attorney General of Canada, filed 4 March 2019;

    b. An excel file called "Historic CIC Counts.xls" containing data regarding the number of First Nations children in care from 1981-82 to 2008-09;

    c. An excel file called "Modern CIC Counts.xls" containing data regarding the number of First Nations children in care from 2007-08 to 2014-15;

    d. An excel file called "NCR-#9607185-v5-FOSTER_CARE_(CHILDREN_IN_CARE)_COUNTS_ 2017-07-12.xls" containing data regarding the number of First Nations children in care from 1957-58 to 2014-15;

    e. An excel file called "1. FNCFS Children in Care 2007-2008 to 2016-2017.xls" containing data regarding the number of First Nations children in care from 2007-08 to 2016-17;

    f. An excel file called "2. Detailed data 2013-2014 to 2016-2017.xls" containing data regarding the number of First Nations children in care from 2013-14 to 2016-17 together with information about their status;

    g. An excel file called "3. Detailed trend analysis 2006-2007 to 2012-2013.xls" containing data regarding the cost and number of days of care for First Nations children in care from 2007-08 to 2012-13;

    h. An excel file called "FNCFS distinct days by child 2013-2018 - PROD - 54152764.xls" containing data for each child within the IMS Database maintained by ISC setting out the date of the first and most recent expense submitted between 1 April 2013 and 31 March 2018;

i. A series of excel files, one for each fiscal year 2000-01, 2002-03, 2004-05 through to 2012-13 (files for 2001-02 and 2003-04 were not included) containing information on each First Nations child that was in care in Ontario during those years, including dates of entry and exit from care and number of days in each fiscal year in care.

j. An excel file called "BC - CFS Child Application Historic 2011-present (Moushoom Litigation).xlsx" containing information on each First Nations child that was in care in British Columbia on or after 1 April 2011 and up to 30 September 2019, including the most recent date of entry to care if entered care prior to 2011, dates of entry and exit from care between 1 April 2011 and 30 September 2019 and the most recent status of children in care; and

k. An excel file called "Adoption Breakdown -1958 to 1990.xlsx" containing information on the number of First Nations children that were adopted between 1958 and 1990.

2. The following documents and data were obtained by us and were utilised in the preparation of this report:

a. "Provincial and Territorial Child Protection Legislation and Policy 2018, public Health Agency of Canada, March 2019.

b. "Moving In and Out of Foster Care" by David Rosenbluth, March 1995. In J. H. a. B. Galaway (Ed.), Child Welfare in Canada: Research and Policy Implications (pp. 233–244) Toronto: Thompson Educational Publishing, Inc.

c. "Canadian Incidence Study of Reported Child Abuse and Neglect: Final Report", authored by Nico Trocmé, Bruce MacLaurin, Barbara Fallon, Joanne Daciuk, Diane Billingsley, Marc Tourigny, Micheline Mayer, John Wright, Ken Barter, Gale Burford, Joe Hornick, Richard Sullivan and Brad McKenzie, Minister of Public Works and Government Services Canada, 2001;

d. "Canadian Incidence Study of Reported Child Abuse and Neglect - 2003: Major Findings", by Nico Trocmé, Barbara Fallon, Bruce MacLaurin, Joanne Daciuk, Caroline Felstiner, Tara Black, Lil Tonmyr, Cindy Blackstock, Ken Barter, Daniel Turcotte and Richard Cloutier, Minister of Public Works and Government Services Canada, 2001;

e. "Canadian Incidence Study of Reported Child Abuse and Neglect - 2008: Major Findings", authored by Nico Trocmé, Barbara Fallon, Bruce MacLaurin, Vandna Sinha, Tara Black, Elizabeth Fast, Caroline Felstiner, Sonia Hélie, Daniel Turcotte, Pamela Weightman, Janet Douglas and Jill Holroyd, Minister of Public Works and Government Services Canada, 2010;

f. There are other documents that will be added in the Final Report.

Appendix 5 Development of the Survivorship Table

Period and Cohort Mortality

1. The most readily available mortality tables that span the years of this action are the Canada Life Tables, a series of mortality statistics produced by Statistics Canada from census data. There are tables available from 1901 to 2017 produced every 5 or 10 years (with a few recently produced annually). These tables provide information about mortality of an average Canadian.

2. Over the past century, mortality of Canadians has improved. That has been evident by the increase in life expectancy at birth from about 61 years[4] in 1931 to about 82 years[5] in 2016.

3. The Canada Life Tables are period tables – they provide information about mortality rates for a specific year. But individuals experience mortality from different years as they progress through life.

4. A person born in 1991 does not experience 1991 mortality as they age. That person born in 1991 is aged 20 in 2011 and benefits from all the factors that have improved mortality over the prior 20 years. To measure the mortality for a 20-year old in 2011, we should utilise the 2011 rates, not the rates that were measured in 1991 at birth.

5. Cohort mortality tables provide rates that recognise the changes in mortality as one ages. By combining the various period mortality tables produced by Statistics Canada, we can produce a series of cohort tables – one table for each year of birth.

6. Unless we make projections about future changes in mortality, a cohort table can only provide information about the rates up to the current year. While there are several tables available that project future improvements to mortality, they are not required for this matter (other than to project mortality from 2017 to 2020) and I have created cohort mortality tables with rates up to 2020 only.

7. Using the available Canada Life Tables, I constructed a series of period tables for each year from 1971 to 2020. The changes in mortality for the years between each of the Canada Life tables was calculated by me using geometric differences. To estimate mortality improvements since 2017, I utilised the Canadian Pensioner Mortality Projection Rates B for 2017 to 2020. That projection table is based on mortality improvements under the Canada Pension Plan for contributors and pensioners.

---

4 In 1931, life expectancy at birth was about 62 for males and about 60 for females.

5 In 2016, life expectancy at birth was about 79.9 for males and about 84.0 for females.

8. Based on the year by year period tables, I combine them to create a series of cohort tables for each birth year 1971 to 2020.

Canada and Indigenous Mortality

9. A number of studies have shown that mortality of Indigenous people differs from that of the average Canadian.

10. I found four articles comparing population mortality for Indigenous Canadians and all Canadians.

    a. "Abridged Life Tables for Registered Indians in Canada 1976-2000" by Ravi B. P. Verma, Margaret Michalowski (Statistics Canada) and R. Pierre Gauvin (Department of Indian and Northern Development) (the "**Verma Study**"). This study looked at life expectancy for Canadians who identify as Registered Indian and compared that to Canadian life expectancy for all Canadians for the period 1976 to 2000.

    b. "L'accroissement démographique des groupes autochtones du Canada au XXe siècle" by Norbert Robitaille and Robert Choinière (the "**Robitaille Study**"). This study compared life expectancy and mortality rates for Registered Indian, Inuit and all Canadians over the period 1941 to 1981 (although life expectancy for Registered Indians was only presented for 1961 to 1981).

    c. "First People Lost: Determining the State of Status First Nations Mortality in Canada Using Administrative Data" by Randall Akee and Donna Feir ("**First People Lost**"), published in February 2018. This report provides ratios of First Nation mortality to all-Canadian mortality by five-year age groups.

    d. "A Statistical Profile on the Health of First Nations in Canada: vital statistics for Atlantic and Western Canada, 2003-2007" by Health Canada, published in 2014 (the "**Health Canada Report**"). This report provides ratios of First Nation mortality for Western Canada only to all-Canadian mortality by five-year age groups.

11. The first two studies provide the results in terms of life expectancy at birth. When constructing a table of survivorship, we need to determine the underlying mortality rates[6] rather than directly using life expectancy. A reasonable approximation to the underlying mortality rates can be obtained by applying a multiplier to the rates from another table of mortality[7].

[6] Both life expectancy and survivorship are calculated from the individual age-based mortality rates.

[7] Applying a multiplier to another mortality table fails to recognise differences in relative mortality by age. However, in my experience the error is usually minor in relation to the added precision gained by having a table that gives a

12. The First People Lost and the Health Canada report provide ratios of First Nation mortality rates to the Canadian mortality rates. These ratios can be directly used to determine rates that apply to First Nations Canadians.

13. The Verma Study calculates Registered Indian life expectancy for 1995 to 2000 of 68.2 years for males and 74.5 years for females. The life expectancy for all Canadians for those years is 76.1 years for males and 81.6 years for females.

14. The Robitaille Study calculates life expectancy for Registered Indians every five years from 1961 to 1981. It also presents life expectancy for Inuit and all Canadians for those years and some prior years.

Table 14 – Life Expectancy of Registered Indians, Inuit and All Canadians 1940 to 1981

Registered Indian		Inuit		All Canadians	
Period	Life Expectancy	Period	Life Expectancy	Period	Life Expectancy
				1940-42	65
		1941-51	30	1950-52	69
				1955-57	70
1961-62	62	1951-61	38	1960-62	71
1965-68	63			1965-67	72
1971	63	1961-71	55	1970-72	73
1976	63			1975-77	74
1981	66	1971-81	65	1980-82	75

15. I have determined that by applying varying mortality multiples to the Canadian Life Tables I can obtain a life expectancy at birth that is similar to the life expectancies for Registered Indians as reported in the Verma and Robitaille Studies.

similar life expectancy to reality. For example, if there is a significant spike in mortality among the population we are looking to model at, say, ages 15 to 30, applying a multiplier to Canadian population rates will recognise those deaths, but they will be spread out over a lifetime rather than between ages 15 and 30.

Table 15 – Life Expectancy[8] and Mortality Multiples for Registered Indians

Year	Canadian Life Expectancy	Registered Indian Life Expectancy	Difference in Life Expectancy	Mortality Multiple
1961	71	62	9	190%
1966	72	63	9	190%
1971	73	63	10	200%
1976	74	63	11	220%
1981	75	66	9	205%
1996-2000	79	71	8	195%

16. From 1961 to 2000, Canadian Registered Indians experienced mortality that was about double the mortality of the average Canadian. In my opinion, the fluctuation between 190% and 220% is not significant and could be explained by either data issues or by improvements in mortality being experienced by Registered Indians and all Canadians at different times during that period.

17. Based on the results of the above analysis, I have assumed that from 1961 to 2000, Registered Indians experienced mortality that on average was 200% of the mortality for all Canadians as measured by Statistics Canada.

18. The First People Lost report and the Health Canada report both show ratios that vary by age rather than a single ratio for all ages.

19. The ratios presented in the First People Lost report are smaller than those in the Health Canada report. Smaller ratios will produce a longer life expectancy and fewer expected deaths. Both reports are based on status Indians. The Health Canada Report studied mortality from 2003 to 2007 in the Western provinces only and the First People Lost from 1974 to 2013 (however, the mortality ratios presented in the First People Lost report are for 2010 to 2013 only). The First People Lost report also shows mortality separately for those living on and off reserve.

20. I have compared the results of the various methods of adjusting the Canada Life Tables to reflect First Nation Canadian mortality. Because we are dealing with young people, it is better to utilise the age-based ratios than a single 200% multiplier (which has the effect of redistributing deaths from younger ages to older ages).

8 The life expectancy shown is an average for males and females.

21. For this report, I have assumed the ratios from the Health Canada report are most appropriate for estimating the survivors.

The Survivorship Table

22. I applied the mortality ratios to the cohort mortality for the Canadian population to estimate mortality rates for First Nation Canadians. From those mortality rates, I calculated the probability of survival for those entering care during the class period. Sample survival rates to 2019 are shown in Table 22.

Table 22 - Survival Rates to 2019

Year of Birth	Year Entered Care					
	1991	1996	2001	2006	2011	2016
1976	93.8%					
1981	95.4%	95.7%				
1986	96.6%	96.8%	97.0%			
1991	96.6%	97.8%	97.9%	98.1%		
1996		97.7%	98.7%	98.8%	99.0%	
2001			98.5%	99.4%	99.5%	99.7%
2006				98.9%	99.8%	99.9%
2011					99.1%	100.0%
2016						99.2%

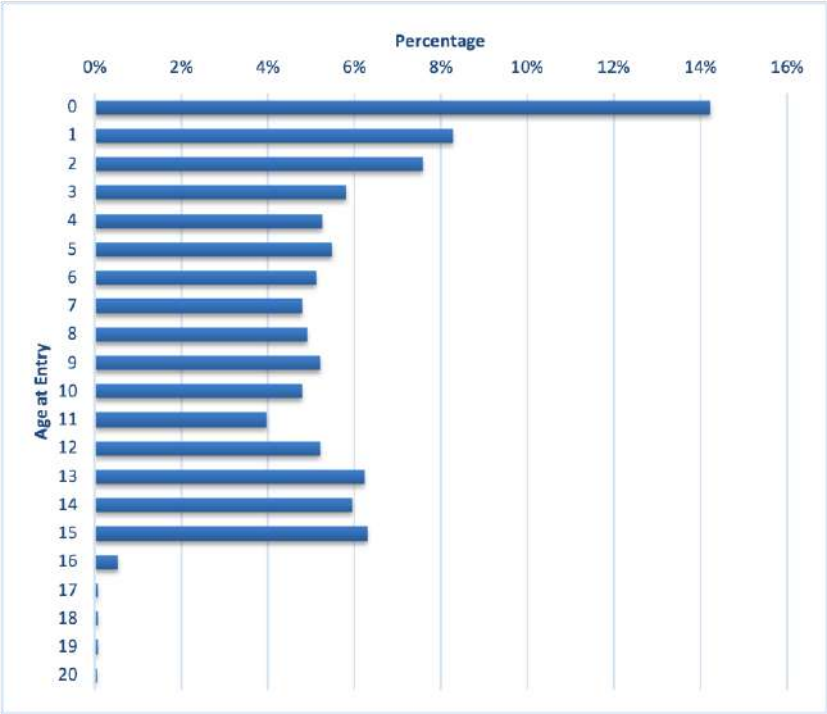
Appendix 6 **Supplementary Analyses**

We were asked to provide supplementary analyses regarding the following parameters: age at entry, age at exit, time in care and time in care by age at entry and exit. The analyses included below all concern children who entered care in fiscal years 2000, 2002, and 2004 as those were the cohorts for which we were able to obtain the most complete data. The children represented in this sample all come from Ontario.

Age at first entry

1. Figure 1 below shows children's age at the beginning of their first entry into care. According to the results, 14.2% of children had their first episode in care before they turned 1 year old in the 2000-2004 entry cohort. The number progressively decreases until age 11, with only 4% of the cohort entering for the first time at that age. The percentage of children entering care for the first time increases again during adolescence, reaching 6.3% at 15 years of age – before dropping abruptly after 15. This drop-off point is related to the maximum age of protection in Ontario, which was 16 years-old until 2017.

Figure 1 - Percentage of children in care from entry years 2000, 2002, and 2004 by age at first entry into care



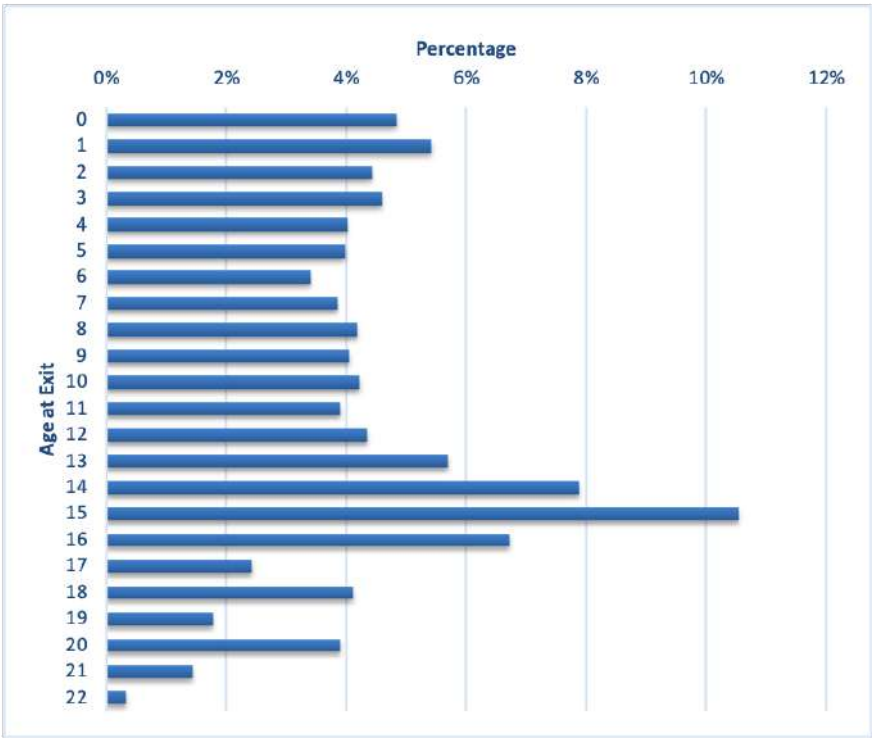
2. For the 2000-2004 entry cohorts, the average age at first entry was 6 years and a half, with a standard deviation of 5.1. 50% of children first entered care at 6 years or younger. The average and median age at first entry was similar for entry years of interest for which we had

incomplete data – that is, children who entered care in fiscal years 2005, 2006, 2007, 2008, 2009, 2010, 2014, 2015, 2016.

Age at last exit

3. Figure 3 below shows children's age at the end of their last period of time in care[9]. The chart shows that 5.4% of children left care at 1 years old in the 2000-2004 entry cohort. By age 15, as many as 10.5% of the children left care.

Figure 3 - Percentage of children in entry years 2000, 2002, and 2004 by age at last exit from care



4. The average age at last exit for the 2000-2004 entry cohort of interest was 10 and a half years, with a standard deviation of 6 years. 50% of the children in this cohort exited care at 11 years or younger. Average age at last exit could not be calculated for the other entry cohorts of interest because we did not have information on their full trajectory in care.

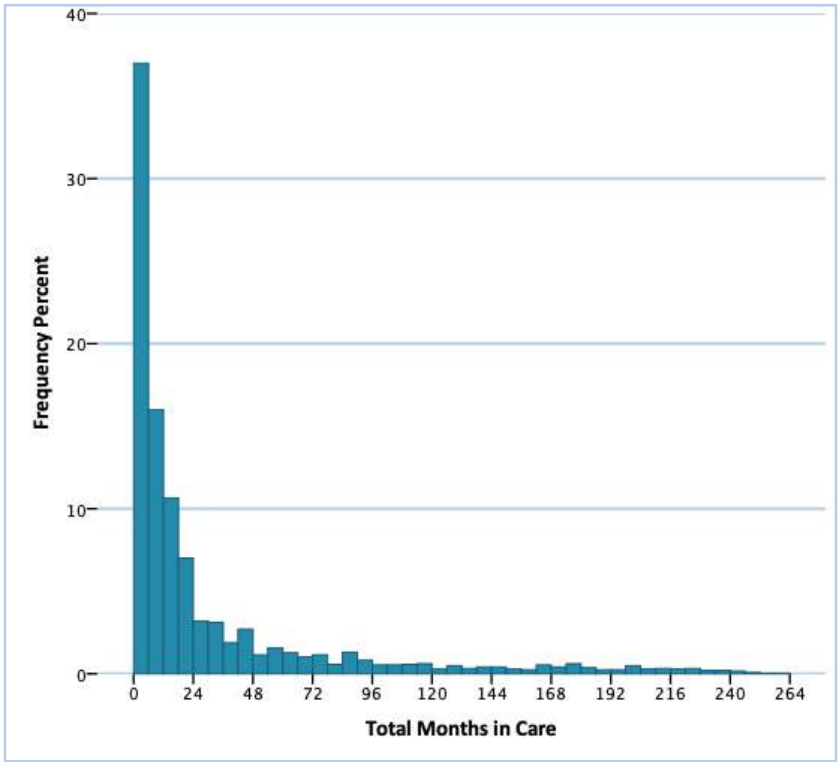
Time in care

5. Figure 5 below presents the distribution of total time in care in months for children in the 2000-20004 entry cohort. Total time in care was measured by calculating the sum of each

[9] Given that age at last exit is calculated by using exit dates, the analyses on age at exit might be impacted by issues with the dataset underlined in paragraph 68.

period of care for each child. Figure 5 shows that 37% stayed in care for 6 months or less. This number decreases significantly with every 6-month increment of time in care.

Figure 5 - Histogram of total months in care for children who entered care in fiscal years 2000, 2002, and 2004



6. According to Table 6, the average length of time in care for entry years 2000, 2002, and 2004 was 30.27 months. However, the distribution is highly skewed, as illustrated in the histogram above, with 25% of children spending less than 2 months in care, 50% of children spending less than 10 months in care, and 75% of children spending less than 32 months in care.

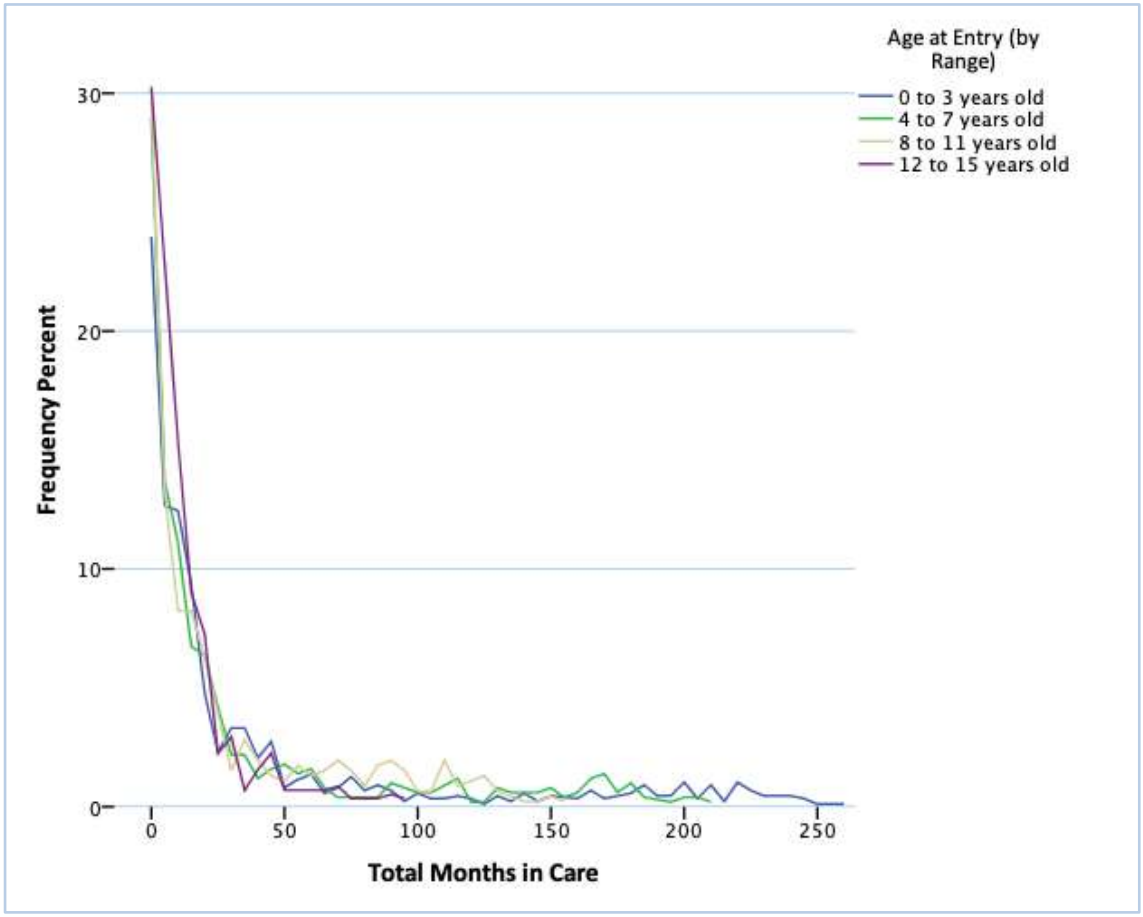
Table 6 – Descriptive Statistics - Total Months in Care for Entry Years 2000, 2002, and 2004

Number of Children	Mean	Median	Standard Deviation	Lower quartile (25%)	Higher quartile (75%)
2,439	30.27	10.00	49.3	2.00	32.00

Time in care by age at first entry

7. Figure 7 below represents the distribution of total time in care in months by age at first entry. The figure shows that the total time in care distribution is very similar for children entering care at different ages. This skewed pattern resembles the one shown in Figure 5.

Figure 7 – Time in care by age at first entry for children who entered care in fiscal years 2000, 2002, and 2004

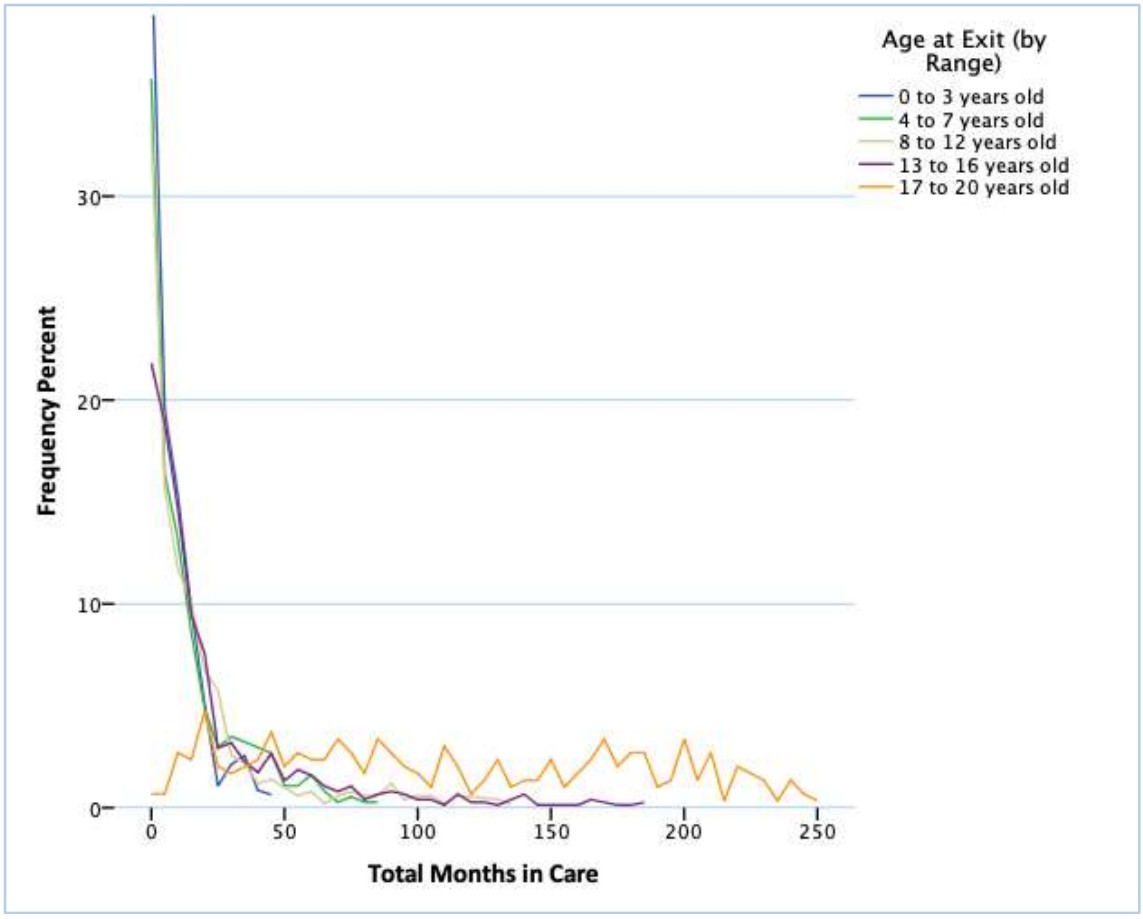


8. While the pattern of time in care remains similar across age groups, average time in care decreases progressively for children who enter care for the first time at a later age (from 41.5 months for children who entered care between 0 to 3 years to 12.7 months for children who entered care between 12 to 15 years). The shorter lengths in care for older children is to be expected since it takes less time for children entering at an older age to reach the age of discharge from care.

Time in care by age at last exit

9. Figure 9 below represents the distribution of total time in care in months by age at last exit. The figure shows that the total time in care distribution is also similar for children exiting care at different ages, with an exception for children who exit care between ages 17 to 20 years old. These children do not show the same skew for smaller values of time in care. This is likely due to the fact that, at the time, Ontario's child protection investigation mandate was limited to children aged 16 and younger. As such, children who exited care between 17 and 20 years would all have spent more than a year in care before they exited care.

Figure 9 – Time in care by age at last exit for children who entered care in fiscal years 2000, 2002, and 2004



10. While the pattern of time in care remains similar across age groups (with the exception of 17- to 20-year-olds), average time in care increases progressively when children exit care for the last time at a later age (from 7.5 months for children who exited care between 0 to 3 years to 112.6 months for children who exited care between 17 and 20 years).

RE: Moushoom/Trout – Removed Children Attaining Age of Majority

Rob:

I have estimated the number of children in the removed child class that will attain the age of majority over future years. I made the following assumptions as part of this work.

1. The number of First Nation children entering care in Canada in each fiscal year 2002-03 to 2018-19 is the number estimated by Nico Trocmé, Marie Saint-Girons and myself in our joint report "Estimated Class Size – First Nations Children in Care 1991 to 2019" dated 18 January 2021 (the "**Joint Report**").

2. The number entering care for fiscal years 2019-20 to 2021-22 were approximately the same as was estimated for the 2018-19 year in the Joint Report – 3,400 per year.

3. In the Joint Report, we estimated the number of children entering care between 1 April 1991 and 31 March 2019 to be 106,000, plus or minus about 15,000. I estimate there are an additional 10,000 First Nation children who entered care from 1 April 2019 to 31 March 2022.

4. The total number of First Nation children who entered care from 1 April 1991 to 31 March 2022 is estimated to be 116,000 plus or minus about 15,000.

5. The age distribution of the children entering care in each year in Canada was similar to the average age distribution of children entering care in Ontario from 2000 to 2012.

6. The age of majority is age 18 in all Canadian jurisdictions with the exception of British Columbia, New Brunswick, Newfoundland and Labrador, Northwest Territories, Nova Scotia, Nunavut and Yukon where it is age 19.

7. I referred to the 2016 census numbers that identify population of First Nations people by band and province/territory and determined that 75% of First Nations people live in a province with an age of majority of 18 and 25% live in a jurisdiction with an age of majority of 19. I assumed that any difference by jurisdiction in the probability of a First Nations child being taken into care is not material to the results and I assumed that 75% of children taken into care attain the age of majority at age 18 and 25% at age 19.

I was advised that children taken into care up to 31 March 2022 are to be included in my analysis. I determined that all children taken into care prior to 1 April 2003 will have attained the age of majority by 31 March 2022 and I have ignored them for purposes of this report.

Based on these assumptions, I determined the number of children that entered care in each of the past 19 years by age of entry and the year in which they will attain the age of majority.

As of 31 March 2022, I estimate that 44,500 of the total 116,000 children are under the age of majority. Consistent with the range provided in the Joint Report, I estimate that number could vary by plus or minus 6,000 – that is the number of children under the age of majority as of 1 April 2022 is likely in the range 38,500 to 50,500.

Based on the single-point estimate of 44,500 under the age of majority, the following table sets out my estimate of the number of First Nations children taken into care from 1 April 1991 to 31 March 2022 who will attain the age of majority in each 12-month period in the future.

Fiscal Year	Number Attaining Age of Majority
Apr 2022 to Mar 2023	3,990
Apr 2023 to Mar 2024	3,910
Apr 2024 to Mar 2025	3,740
Apr 2025 to Mar 2026	3,530
Apr 2026 to Mar 2027	3,420
Apr 2027 to Mar 2028	3,250
Apr 2028 to Mar 2029	3,130
Apr 2029 to Mar 2030	2,890
Apr 2030 to Mar 2031	2,600
Apr 2031 to Mar 2032	2,280
Apr 2032 to Mar 2033	2,120
Apr 2033 to Mar 2034	2,000
Apr 2034 to Mar 2035	1,850
Apr 2035 to Mar 2036	1,640
Apr 2036 to Mar 2037	1,430
Apr 2037 to Mar 2038	1,190
Apr 2038 to Mar 2039	900
Apr 2039 to Mar 2040	530
Apr 2040 to Mar 2041	100
Total	**44,500**

COMPENSATION FOR THE DELAY AND DENIAL OF SERVICES TO FIRST NATIONS CHILDREN

OFFICE OF THE PARLIAMENTARY BUDGET OFFICER
BUREAU DU DIRECTEUR PARLEMENTAIRE DU BUDGET

The Parliamentary Budget Officer (PBO) supports Parliament by providing economic and financial analysis for the purposes of raising the quality of parliamentary debate and promoting greater budget transparency and accountability.

This report estimates the financial cost of complying with a Canadian Human Rights Tribunal decision (2019 CHRT 39) as it relates to children who experienced delays and denials of services which should have been available under Jordan's Principle. A previous report estimated the cost of complying with that decision as it relates to children taken into care.

6.2. 100 Under Denied Claims 12
6.3. 90,000 Affected by Service Gaps 12

Notes 15

Executive Summary

In September 2019, the Canadian Human Rights Tribunal (CHRT) ordered Canada to pay compensation to certain First Nations children. That decision included compensation for children who remained in their home but were "denied services or received services after an unreasonable delay or upon reconsideration ordered by [the] Tribunal, between December 12, 2007 … and November 2, 2017."

Cost of complying with the compensation order

This report estimates that 33,000 additional persons will be eligible for compensation in relation to the delay and denial of services, entailing a cost of $1.3 billion. This estimate is highly uncertain due to data limitations. Indigenous Services Canada's (ISC) initial estimated liability did not include any cost of complying with the Jordan's Principle aspect of the order.

The total cost of complying with the CHRT's order consists of the compensation for delays and denials of services estimated in this report and compensation for children taken into care estimated in a prior report to be $0.9 to $2.9 billion.

The total cost of complying with the CHRT's order is estimated to be $2.2 billion to $4.2 billion.

Cost of complying under parties' assumed interpretation of that order

The parties to the CHRT proceeding submitted a framework, approved by the CHRT on 12 February 2021, for the payment of compensation under the CHRT's order. The framework and the process leading to it suggest that parties intend to offer broader compensation that required by the CHRT order.

Specifically, subsequent submissions indicate that parties have assumed that compensation must be paid to all children who were deprived of essential services as a result of a gap in services. The 2019 CHRT order only requires compensation to be paid to children who were deprived of essential services as a result of a gap in services if that child was taken into care; children who remained in their homes are compensated only for delays and denials of services. With the interpretation apparently assumed by the parties, 250,000 additional persons will be eligible for compensation in relation to the delay and denial of services or gaps and services, entailing a cost of $10 billion.

This figure is, to an even greater extent, highly uncertain due to data limitations.

The approved compensation framework also explicitly provides for broader compensation for children taken into care. Specifically, it compensates all children taken into care instead of children unnecessarily removed from their home, family, and community. This would result in an estimated $6.5 billion in compensation being paid in relation to children taken into care.

The total cost of complying with the order based on the interpretation of that order set out in the compensation framework and process leading to that framework is estimated to be $15 billion after accounting for overlap.

1. Jordan's Principle

The Origins of Jordan's Principle

Jordan River Anderson was a First Nations child with a severe medical condition. He was surrendered into provincial care in order to receive medical services which were not available on-reserve. After spending two years in hospital, he could have been placed into a specialized foster home close to the hospital for the remaining few years of his life. He was unable to do so because Indigenous Services Canada (ISC), Health Canada, and the Province of Manitoba disagreed over who should pay for the costs of home-based care.[1]

Jordan's Principle, named in recognition of Jordan River Anderson, is a systemic order of the CHRT regarding the approval of government services for First Nations children.[2] Where a government service is available to all other children, the government department of first contact must pay for the service. Where a service is not necessarily available to all other children, the government department of first contact must evaluate the needs of the child to determine whether the requested services should be provided to ensure substantive equality, to ensure culturally appropriate services, or to safeguard the best interests of the child.[3]

Jordan's Principle requests can be submitted by individuals or groups. The individual or group filing the request does not need to specifically invoke Jordan's Principle for it to apply. When a request is refused under another program, ISC considers whether Jordan's Principle applies. When a request specifically invokes Jordan's Principle, it may nevertheless be referred to an applicable existing program.

Jordan's Principle Claim Volumes

The federal government initially applied a narrow definition of Jordan's Principle which focused on jurisdictional disputes related to children with severe medical needs. As a result, very few cases were identified by the federal government where the principle applied. The CHRT subsequently ordered the federal government to revise its definition and reconsider the applications it had denied.

Since the federal government broadened its definition of Jordan's Principle, it has received a large number of claims. More than 594,000 claims were approved between July 2016 and April 2020.[4] With approximately 375,000 First Nations children including those off-reserve, this represents approximately 1.6 claims per current First Nations child or roughly one per person when including those who became adults during the period.[5]

Since 2017, most approved products and services have been provided under "community managed group requests". From March to August of 2019, 126,257 out of 136,003 approved products and services under Jordan's Principle (92%) were approved under group requests.[6]

The reported volume of services provided under group requests greatly overstates the number of unique children receiving essential services. By volume, most services funded under group requests are activities on the land or social activities which are not generally included on lists of essential services.[7] In addition, children participate in multiple funded activities and are counted as receiving a service for each event they attend. However, these group requests also included services which are clearly essential, like intensive mental health counselling.

2. Compensation Order

In September 2019, the Canadian Human Rights Tribunal (CHRT) ordered Canada to pay compensation to certain First Nations children and their caregivers.

That CHRT decision included compensation for children unnecessarily removed from their home, family and community. In a previous report, we estimated that 19,000 to 65,100 persons would be eligible for compensation in relation to such removals, entailing a cost of $0.9 billion to $2.9 billion. This includes compensation for children removed from their home in order to receive services. The estimate was based on compensation being paid to all children unnecessarily removed from their home, family, and community.

With respect to this aspect of the order addressed in the PBO's prior report, the parties to that agreement proposed a compensation framework, approved by the CHRT on 12 February 2021,which extends compensation to all children removed from the home, including those placed in kinship care and irrespective of whether the removal was unnecessary.[8] In this way, the cost of compensating children would rise to $6.5 billion under the compensation framework with 72,000 children and 73,000 parents receiving compensation.

The CHRT order also included compensation for children who remained in their home but were "denied services or received services after an unreasonable delay or upon reconsideration ordered by [the] Tribunal, between December 12, 2007 … and November 2, 2017." This aspect of the order is the subject of this report.

The parties to the CHRT proceeding have apparently assumed the decision requires compensation to be paid to all children who were deprived of essential services as a result of a gap in services.[9] However, the CHRT order only requires compensation to be paid to children who were deprived of essential services as a result of a gap in services where that child was taken into care. Further explanation of this point is provided in Annex A.

3. Affected Children

The number of children who were affected by delays and denials of essential services is highly uncertain because Jordan's Principle claims were not tracked prior to 2017. The below table shows the estimated number of affected children, by group. In total, about 13,000 children are expected to be eligible for compensation, mostly in relation to delayed approval of group claims. A further 90,000 children affected by essential service gaps are assumed not to be eligible but would be eligible under the interpretation apparently assumed by parties to the CHRT proceeding.[10]

The estimation of these figures is explained in Annex B.

Eligibility	Form of denial of services	Individual	Group
Eligible	Delayed	200	12,800
	Denied	10	90
	Approved upon reconsideration	50	
Not eligible but apparently assumed eligible by parties	Service Gaps	90,000	

4. Cost Implications

Each affected child is entitled to $40,000.[11]

Any caregiving parents of that child are also each entitled to $40,000, or if the parents were absent and the children were in the care of one or more grand-parents, any caregiving grandparent of that the child are each entitled to $40,000.[12] First Nations children live with an average of 1.5 biological parents (or grandparents if parents are absent).[13]

With 13,000 children assumed to be eligible, this implies 20,000 eligible parents for a total of 33,000 persons eligible for compensation. This would entail a cost of $1.3 billion.

The total cost of complying with the CHRT's order consists of the compensation for delays and denials of services estimated in this report and compensation for children taken into care estimated in a prior report. The total cost of complying with the CHRT's order is estimated to be $2.2 billion to $4.2 billion.

Under the interpretation of the CHRT's decision apparently assumed by the parties to that proceeding, eligibility is much broader. If compensation is also paid to the approximately 90,000 First Nations children who were affected by gaps in essential services but were not removed from the home, there would be roughly 100,000 eligible First Nations children and 150,000 eligible parents or grandparents of such children for a total of 250,000 persons eligible for compensation. This would entail a cost of $10 billion.

As noted earlier, the compensation framework also provides for broader compensation for children taken into care.[14] Specifically, it compensates all children taken into care instead of children unnecessarily removed from their home, family, and community. Under these parameters, and assuming 26% of placements are in informal kinship care only as seen in Quebec, the model set out in our prior report suggests that approximately 72,000 children and 73,000 parents or grandparents would be eligible for compensation in relation to removals.[15] This would suggest the cost of paying compensation for removals would total $6.5 billion.

This suggests that, in combination, complying with the CHRT's order in the manner set out in the compensation framework would cost $15 billion, after accounting for the proportionate overlap between the two eligible groups.

5. Annex A: Eligibility with Service Gaps

The parties to the CHRT proceeding have apparently assumed that the decision requires compensation to be paid to all children who were deprived of essential services as a result of a gap in services.[16] The CHRT clarified in a subsequent decision that a service gap, which exists even where no request was ever made, is distinct from delays and denials where a request was made.[17]

However, the CHRT order only requires compensation to be paid to children who were deprived of essential services as a result of a gap in services where that child was taken into care. In full, the CHRT order on this point reads:

> The Panel finds there is sufficient evidence and other information in this case to establish, on a balance of probabilities, that Canada's systemic racial discrimination found in the Tribunal's Decision 2016 CHRT 2 and subsequent rulings: 2017 CHRT 7, 2017 CHRT 14, 2017 CHRT 35 and 2018 CHRT 4, resulted in harming First Nations children living on reserve or off-reserve who, as a result of a gap, delay and/or denial of services were deprived of essential services and placed in care outside of their homes, families and communities in order to receive those services or without being placed in out of home care were denied services and therefore did not benefit from services covered under Jordan's Principle as defined in 2017 CHRT 14 and 35 (for example, mental health and suicide preventions services, special education, dental etc.). Finally, children who received services upon reconsideration ordered by this Tribunal and children who received services with unreasonable delays have also suffered during the time of the delays and denials. All those children above mentioned experienced pain and suffering of the worst kind warranting the maximum award of remedy of $20,000 under section 53 (2)(e) of the CHRA. Canada is ordered to pay $ 20,000 to each First Nation child removed from its home and placed in care in order to access services and for each First Nations child who was not removed from the home and was denied services or received services after an unreasonable delay or upon reconsideration ordered by this Tribunal, between December 12, 2007 (date of the adoption in the House of Commons of the Jordan's Principle) and November 2, 2017 (date of the Tribunal's 2017 CHRT 35 ruling on Jordan's Principle), following the process discussed below. [Emphasis added]

With respect to the children taken into care, the order includes children unable to access services as result of a gap in services. Because these children were included in our previous report on children taken into care, they do not represent additional children entitled to compensation for the purposes of this estimate.

However, with respect to children not taken into care, admissibility is consistently restricted to children who were denied services, received services upon reconsideration, or received services after unreasonable delays. Moreover, the distinction between children who were and were not removed would be irrelevant if both groups were eligible for compensation whenever they were unable to access services. No explanation for the distinction is provided in the CHRT's analysis.

The parties to the CHRT proceeding have apparently assumed that the decision would benefit the large number of First Nations children who were

1. unable to access services as a result of service gaps but did not request those services, and

2. were not taken into care in order to receive those services.[18]

In addition, there is some potential ambiguity as there is no analysis supporting this distinction and the CHRT makes statements, in the context of defining a "service gap", which reject Canada's argument that a service must have been requested for compensation to be provided.[19] For this reason, this report presents the consequences of adopting the interpretation apparently assumed by the parties, i.e. that all children affected by service gaps are eligible, irrespective of whether they were taken into care in order to receive those services.

6. Annex B: Estimation of Affected Children

This Annex outlines the calculations of the size of each group of affected children.

Because systematic tracking of Jordan's Principle claims did not begin until June 2017, claims based on requests submitted between June 2017 and the November 2017 cut-off date are analysed separately from those submitted from 12 December 2007 to June 2017. In addition, the lack of tracking means that the number of children affected by delays and denials essential services prior to June 2017 is highly uncertain.

6.1. 13,000 Under Delayed Claims

200 Under Delayed Individual Claims

Based on PBO's analysis of ISC's operational data between June 2017 and November 2017, there are 219 distinct individuals who received approval for services after more than 2 calendar days had elapsed between the time ISC reported having received sufficient information to make a decision and the request being approved.[20] Without a case-by-case review of the details or a concrete standard, it is impossible to determine whether these delays were unreasonable. Some were in areas where there is little risk of harm from a few days of delay, like education, but most were in areas that are potentially more urgent like respite care and medical transportation.

Between April 2007 and June 2017, a very small number of Jordan's Principle requests were tracked because the federal government had a narrow interpretation of that principle. As a result, data prior to June 2017 is incomplete, which makes it difficult to identify children potentially eligible for compensation in relation to delays prior to 2017.

For the period prior to June 2017, the federal government conducted a retroactive review of its records using the CHRT's broader definition of Jordan's Principle. Among 203 individual requests identified in this retroactive review, 50 claims were approved upon reconsideration. The children who needed the services identified in these requests are explicitly eligible for compensation under the CHRT's order.

Some individual requests approved between 1 April 2007 and June 2017 may have been unreasonably delayed, but these claims cannot be identified from

any available data as they were not tracked. With only 195 unique children having approved claims in 2016, the historical number of individual claims is likely small relative to claims received after that date and historical group claims.[21]

Overall, it is assumed the delay was unreasonable for 200 children.

12,800 Under Delayed Group Claims

Between June 2017 and November 2017, there were 92 communities who received approval for services after more than 7 days had elapsed. To assess the risk associated with these claims, the PBO requested a sample of Jordan's Principle group claims from ISC. The nature of group events funded under group JP's claims are highly variable – "services" might range from community ice-fishing to intensive mental health counselling. Clearly some individuals received essential services under group requests, but that number is far less than the total of the number of children participating in each event.[22]

For the purposes of a rough estimate, it was assumed the each of the 92 delayed group claim provided essential services to 25 children. This roughly aligns with the number of children who received services that would be recommended by a professional – like occupational therapy, physiotherapy, speech and language therapy, and mental health assessments. It excludes activities on the land and social activities.

Across 92 tracked community requests, this would suggest there may be 2,300 children eligible for compensation.

Children would also be eligible in relation to group requests within the scope of Jordan's Principle submitted prior to 2017 that were delayed or denied at the time. This would include examples of Jordan's Principle claims cited by the CHRT, such as a request submitted by Wapekeka First Nation for an in-community mental health team prior to suicides in that community.

There is little information available regarding group requests within the Scope of Jordan's Principle prior to 2017. Prior to 2017, these requests were not systematically identified nor tracked. These requests may have been made to a variety of ISC programs, including public health and education programs. These requests may, or may not, have cited Jordan's Principle. While some of theses requests may have been approved, few requests, if any, would have been approved within the CHRT's subsequently established timelines.

In the first four months of 2017, prior to the CHRT's May 2017 order expanding Jordan's Principle, the federal government received an average of 3.5 group requests each month. Assuming this is the reflects the rate at which requests had been submitted historically, this suggest there may have

been about 420 requests submitted between 2007 and 2017. Assuming each request would have provided essential services to 25 persons, this represents 10,500 persons potentially eligible for compensation.

There is extreme uncertainty around this figure for several reasons. In particular, since May 2017 a large and increasing number of group claims have been submitted. To some extent, this may reflect claims previously submitted to other programs being identified and addressed as Jordan's Principle claims, which would suggest many more children may be eligible for compensation. But it may also reflect First Nations groups submitting more claims because they are aware of the expanded scope of Jordan's Principle or are aware of claims approved under that principle in other communities, which would suggest a similar volume of requests did not exist prior to 2017.

6.2. 100 Under Denied Claims

10 Under Denied Individual Claims

Among the 203 denied requests between 1 April 2007 and 1 November 2017 which were re-reviewed by ISC, 98 were denied upon re-review. Since the re-review was overseen by the CHRT, most of those re-denied claims probably fall outside of the scope of Jordan's Principle. It is assumed that 10 might have been wrongfully redenied and give rise to compensation.

90 Under Denied Group Claims

Between June 2017 and November 2017, there were two communities who had requests for services denied. The denied requests each served less than 50 children. This suggests that at most 100 children could be entitled to compensation in relation to post-2017 denied group claims. It is assumed that 90 children are entitled to compensation in relation to these claims. Group claims denied at the time of request prior to 2017 are assumed to be captured in the above estimate of the number of children affected by delays in the approval of group claims. Since group need is generally ongoing, it is assumed that claims denied prior to 2017 would have been resubmitted and approved after 2017, making them cases of delays rather than denials.

6.3. 90,000 Affected by Service Gaps

Whereas delays and denials refer to services that were requested, service gaps are situations where services were required but not requested.[23]

As explained above, the CHRT order does not require children to be compensated when they were deprived of an essential service due to a service gap unless they were placed in care. Because our previous estimate of the cost of compensating children taken into care included these children, these are not additional eligible children for the purposes of this estimate.

However, the parties to the CHRT proceeding have apparently assumed, in the process leading to the implementation framework, that these children are eligible. [24] So, it is worth estimating the scope of this population who may receive compensation if this interpretation is reflected in an agreement between the parties which is subsequently incorporated into a CHRT order.

Prior to 2017, Jordan's Principle claims were not systematically tracked. As part of its reconsideration of denied claims, ISC attempted to identify and reconsider claims within the scope of Jordan's Principle which might not have been tracked. This involved a search by ISC employees of all their records, as well as a search of newspapers, discussions with regional staff and services providers, and outreach through the Assembly of First Nations. While this process is not subject to any cut-off date, ISC identified 203 claims denied between 1 April 2007 and 2 November 2017, as of 2020. These claims were discussed above.

Nevertheless, the scope of potential untracked claims that could be raised once compensation becomes available is large.

The absence of requests or recommendations does not limit the eligible population. It is quite possible that ISC would have no record of a request for services. It is also quite possible that a service would be recommended by a professional without actually being requested from ISC, especially when published materials indicated that a service was not available and previous requests had been denied. And even if there was never any request or recommendation, families may still be able to make a claim for compensation. While the exact circumstances in which this would occur are not specified, the decision appears to imply that the lack of an assessment, referral or recommendation should not automatically disentitle a claimant where they were unable to access assessment or referral services due to systemic barriers in access to services.[25]

The CHRT clarification decision indicates that "not all supports, products and services as currently approved by Canada since the Tribunal's rulings in 2017 CHRT 14 and 2017 CHRT 35 are equally necessary" and that as a result, "some measure of reasonableness is acceptable" in defining what is an essential service.[26] However, the decision also indicates that children may be entitled to compensation for violations of substantive equality, even if there was no adverse impact on the health or safety of a First Nations child.[27] While vague, it appears this definition would exclude the vast majority of services delivered under Jordan's Principe group requests, like activities on the land and social activities. The CHRT clarification decision also suggests that the

services should generally have been recommended by a professional, which supports narrowing compensation to the types of service that would be recommended by a professional, like occupational therapy, physiotherapy, and mental health services.[28]

The requirement that a service was recommended by a professional, or would have been recommended by a professional but for systemic barriers, roughly aligns the scope of need for which compensation is available with the scope of services now being approved under Jordan's Principle individual requests. As such, it is instructive to look at recent Jordan's Principle claims to understand the scope of need which may have existed historically.

Since expanding its definition of Jordan's Principle, the federal government has approved a large number of individual requests for products and services. In 2019, ISC approved 25,508 individual requests, of which 10,335 were from new and unique children.

The number of new original claims that would have been submitted since 2007 was simulated based on population churn and the specific probabilities of persons with and without a prior JP claim filing a claim in a given month of 2019. Given these assumptions, it is expected that 90,000 unique children would have needed services covered by Jordan's Principle from December 2007 to June 2017. This represents compensation being paid in relation to approximately one in five First Nations persons who were children in 2017 or became adults in the preceding 10 years. While meaningful comparisons are difficult, the Indigenous Services Canada's Non-Insured Health Benefits program paid pharmaceutical benefits to 138,016 registered Indian persons under 19 years of age in the 2018-19 fiscal year alone, about half of registered Indian persons under 19.[29] But, this reflects different services being provided to a narrower population and without accounting for repeat need across years.

There will be a moderate administrative burden to bring a claim. Families would have to provide some evidence that they were recommend, or would have been recommended, a service within the scope of Jordan's Principle.

However, there is no requirement to testify or provide any evidence of harm suffered as a result of not receiving services. In addition, there is also a strong incentive to bring forward claims with $80,000 to $120,000 in compensation available per family depending on the number of caregivers the child had at the time of the recommendation. The financial compensation available suggests uptake could be very high.

As a result, it is estimated that 90,000 unique children affected by service gaps would receive compensation. However, this figure is extremely uncertain.

Notes

[14] See endnote 8.

[15] The ratio is not 1.5 to 1 because some parents are excluded because their child was removed due to abuse.

[16] While not explicit, this assumption is apparent throughout the submissions of parties summarized in 2020 CHRT 15.

[17] 2020 CHRT 15.

[18] See endnote 9.

[19] 2020 CHRT 15 at para 106-7, 146.

[20] The date on which ISC reports having received sufficient information may not be the same as the date on which the CHRT would consider ISC to have received sufficient information. In addition, due to missing data, it is not possible to determine whether approximately 900 additional claims were approved after more than 2 days had elapsed.

[21] Data provided by ISC 19 Oct 2020.

[22] For the delayed requests, it is difficult to determine the number of children served because of the way in which ISC collects this data. If, for example, a group request funded a series of events in the community, the number of children served would be reported to ISC as the sum of the number of children who attended each event. This is problematic because the same child is counted twice even though they could only be compensated once.

We are Coming to the Light of Day

Throughout the many years of the National Policy Review, we have traveled down many paths –sometimes we have stumbled in the darkness trying to move forward in a good way. We could not see our way forward clearly.

This report provides the clear evidence needed to ensure First Nations children and families receive what is rightfully theirs – a chance to live with dignity, in the ways of their ancestors, safely at home.

The light is beginning to shine – to light our way forward. We can not turn back or stand still – generations are depending on us to go forward – now that we can.

Donald Horne, Kahnawake First Nation
Elder and First Nations Representative
to the National Policy Review (2000-2003).

CHAPTER 1
SUMMARY OF FINDINGS

by Cindy Blackstock, Tara Prakash, John Loxley and Fred Wien

Abstract

This multidisciplinary research project brought together experts in First Nations child welfare, community development, economics, management information systems, law, social work and management to inform the development of three funding formula options to support policy and practice in First Nations child and family service agencies in Canada. This unique research approach involved specialized research projects on the incidence and social work response to reports of child maltreatment respecting First Nations children, prevention services, jurisdictional issues, extraordinary circumstances, management information services and small agencies. These research projects were complimented by the results of twelve case studies of First Nations child and family service agencies in Canada. Findings indicate that First Nations children are over represented at every level of the child welfare decision making continuum including reports to child welfare, case substantiation rates, and admissions to child welfare care. In fact an analysis of child in care data by cultural group indicated that one in ten Status Indian children in three sample provinces were in care as of May 2005. Research results indicate that First Nations child and family service agencies are inadequately funded in almost every area of operation ranging from capital costs, prevention programs, standards and evaluation, staff salaries and child in care programs. The disproportionate need for services amongst First Nations children and families coupled with the under-funding of the First Nations child and family service agencies that serve them has resulted in an untenable situation. Recommendations for policy change and future research are discussed.

Project Overview

[The Committee] is equally encouraged by the establishment of First Nations child and family service providing culturally sensitive services to Aboriginal children within their communities. United Nations Committee on the Rights of the Child Concluding Observations Canada, 2003, Observation 26.

There are approximately three times the numbers of First Nations children in state care than there were at the height of residential schools in the 1940's (Blackstock, 2003). Taken together the 9000 First Nations children in care who are resident on reserve in Canada will spend over two million nights away from their families this year (McKenzie, 2002). Through the years, many have dreamed of making a difference for these children – to allow them to stay safely at home. This research project is dedicated to those children, their families and to making the dream of keeping them safely at home a reality. The most encouraging and important finding of this research project is that there really are things we could be doing for this generation of First Nations children to improve their well being – and in most cases it is as simple as providing them access to the resources enjoyed by other Canadians – but in a manner that reflects their distinct identity.

Recent research has confirmed that First Nations children are removed at disproportionate rates due to neglect (Blackstock, Trocme, & Bennett, 2004). When neglect is unpacked – poverty, poor housing and substance misuse are identified as key drivers (Trocme, Knoke, & Blackstock, 2004). This report is as much about redefining social work to better respond to the needs of First Nations families as it is about providing an evidence base for a renewed, and hopefully, equitable funding regime for First Nations child welfare. The researchers involved in this project represent some of the most renowned experts in Canada. We are honoured they are sharing their knowledge in this report – we know they did it because they believed it would make a difference. However, no report alone can do that – at the end of the day it is up to all those who read this report to mobilize this knowledge into beneficial action that First Nations children can experience – not just hear.

Building on the 17 recommendations of the Joint National Policy Review of First Nations Child and Family Services (NPR) (MacDonald and Ladd, 2000), the National Advisory Committee of the Joint National Policy Review (NAC) requested that the First Nations Child and Family Caring Society of Canada (FNCFCS) undertake research to respond to the research questions identified in Phase One[1] of the research project to inform three possible funding options for First Nations child and family services:

1) **Integrating recommendations of the NPR into the current funding formula, Directive 20-1, Chapter 5 (hereinafter called the Directive or Directive 20-1)**

2) **Linking First Nations child and family service agency funding with provincial child welfare funding levels**

3) **A new First Nations based funding formula.**

The first two possible funding models are relatively well defined with the first having benefited from the recommendations of the Joint National Policy Review on First Nations Child and Family Services completed in 2000 and the second based on standardized provincial funding formulae where they exist. In terms of the restructuring of Directive 20-1, the seventeen recommendations improve funding for First Nations child and family services contained in the National Policy Review were validated in Phase One and formed the primary frame of reference for analysis of this option in Phase Two (excluding the recommendation for a review of the funding arrangement in Ontario which will need to be done under a separate process).

The provincial option is also reasonably well defined although it is not always clear how specific child welfare services are funded within universal provincial social services funding pools. Moreover, as detailed later in this report there were instances where provinces had lost sight of the original funding formula over time and had simply adjusted the rate according to volume and

cost of living indices. Nonetheless, three provinces were identified for further research – Alberta, Nova Scotia and Manitoba and should provide a reasonable basis for determining if linking First Nations child and family service funding to the level of funding provided by the province in their respective area is a viable option.

The First Nations model is potentially the most promising although it is undoubtedly the most difficult to develop as there are no pre-existing funding template models to refer to. The potential lies in the possibility of re-conceptualizing the pedagogy, policy and practice in First Nations child welfare in a way that better supports sustained positive outcomes for First Nations children. There are several theme related studies in Phase Two which will contribute to this model – such as the secondary analysis of the First Nations data set in the Canadian Incidence Study of Reported Child Abuse and Neglect (CIS) and the Management Information System report. Although other study methodologies will inform this model, these two studies are particularly important given that any new funding regime should be founded on evidence based research and data – not speculation.

In terms of the CIS, this study describes the characteristics of children and their families who came into contact with the child welfare system over a three month period in 2003 (eight First Nations child and family service agencies participated.) As this is the second cycle of the CIS it is possible to compare results respecting Aboriginal children collected and analyzed as a part of the 1998 study.

The review of management information systems will also be a critical report in that will describe the current capacity of First Nations agencies to collect and report data that could potentially inform a First Nations funding formula model. The MIS review includes key informant interviews with First Nations child and family service agencies using a variety of data management systems ranging from pen and paper to agency based MIS systems.

The research for Phase Two began in January 2005 when FNCFCSA identified an interdisciplinary research team including experts in economics, First Nations child and family services, sociology, substance misuse, community development, management, public administration, management information systems, psychology and law. Methodological approaches for research projects were designed in accordance to the requirements of each research question identified in Phase One. A key method was to conduct detailed case studies of 12 First Nations child and family service agencies and the provinces using standardized questionnaires administered by regional researchers. The surveys include questions describing the range of services currently provided as well as to map out optimal levels of service and the costs associated with ensuring an equitable and culturally based funding formula going forward.

Selected First Nations child and family service agencies were also contacted by experts in management information systems, jurisdictional disputes and child maltreatment prevention services in order to inform the funding formula research. culminating in a report on the findings in June of 2005. These tight time frames have impacted the ability of our research team to fully analyze all aspects of the project. Nonetheless, results suggest that given the variety of research methodologies, the expertise of the research team and the cooperation of First Nations child and family service agencies and the federal and provincial governments have yielded substantial information to guide the National Advisory Committee in its efforts to develop a new funding formula.

This chapter provides an overview of the findings of all research projects and describes the implications of these findings for three funding formula options. In the spirit of transparency, full research reports on specific research areas are published in subsequent chapters in this report except in instances where publication of the report would reveal the identity of research participants.

Guiding Principles

The following set of guiding principles was established by the National Advisory Committee to guide the development of a new funding formula for First Nations child and family services:

- Supports culturally based services
- Consistent with the United Nations Convention on the Rights of the Child
- Ensures equal benefit to children under the law
- Supports preventative services and community development in relation to child maltreatment
- Responsive to the proportion of high needs children
- Accommodates unexpected occurrences
- Responsive to remoteness and service context
- Permits flexibility in allocation of budget
- Provides automatic price adjustments
- Provides adequate funds to meet needs of children in care
- Reflects the mandate of INAC

Research Questions and Methodology Summary

Table One on the following page summarizes the research questions identified in Phase One to inform each of the funding options and the methodology used to respond to each question.

Once all the data was retrieved from the various projects, the principal investigators reviewed the projects to identify how the research findings linked together to inform the three funding formula options. This analysis was presented to the National Advisory Committee for their review and the final report was prepared after having considered their comments.

Table 1: Summary of Research Questions

Funding Formula Option	Research Question	Methodology
Redesign of Directive 20-1	• Prevention • Identifying gaps in the current formula • Extraordinary Costs • Management Information Systems (MIS) • Capital Costs • Implications for small agencies • Jurisdictional disputes	• Principal methodology for all topic areas involves conducting literature reviews and key informant interviews. • Key informant interviews with 12 sample FNCFSA representing diversity in cultures, operating contexts and sizes will inform the development of a questionnaire to be administered to all FNCFSA in the Phase III of the research. • MIS and legal experts conducted independent studies for the MIS and jurisdictional dispute analysis. • Secondary analysis of the Aboriginal sample of the Canadian Incidence Study on Reported Child Abuse and Neglect (2003) informed prevention and gaps research topics. • Focus group conducted for prevention services
Tying the Formula to Provincial Standards	• Identification of funding formulas used by each province/territory • What results would be achieved if provincial formulas were applied to FNCFSA? • Comparative analysis of provincial formula versus Directive 20-1	• Literature review • Key informant interviews with each province/territory to identify funding formula • Key informant interviews with FNCFSA (using sample of 12 agencies) • Analysis of three provincial funding formulas • Analysis of all information by econometrician and policy experts
First Nations Based Formula	• Identification of unique conditions faced by FN communities in CFS. • Best Practices in FNCFSA and conditions that support best practice • Ideal set of programs and services in this context and the cost of delivering them • What adjustment factors would be needed to accommodate different communities • What is the range of funding formula options that could best support a First Nation child welfare system • Implementation steps	• Literature reviews to describe the unique conditions and best practices in FNCFSA and economic formula options. • Key informant interviews with a diversity of First Nations Child and Family Service Agencies (utilizing 12 case studies proposed for option one) • Identification of specific data sets and concordant infrastructure needed to further develop this option. • Canadian Incidence Study on Child Abuse and Neglect

Research Team

FNCFCS was honoured to work with the following esteemed researchers, many of whom are broadly recognized as being amongst the best in their field of research, both nationally and internationally:

Summary of Research Project Findings

1. The Experience Of First Nations Children Coming Into Contact With The Child Welfare System In Canada: THE CANADIAN INCIDENCE STUDY ON REPORTED ABUSE AND NEGLECT

The profiles of Aboriginal families differ dramatically from the profile of non-Aboriginal families. Aboriginal cases predominantly involve situations of neglect where poverty, inadequate housing and parent substance abuse are a toxic combination of risk factors.
(Trocme, MacLaurin, Shangreaux & Fallon, 2005)

Study Design and Methodology

Despite the graphic over-representation of Aboriginal children in the child welfare system in Canada, until 1998 there was no information available on why these children were coming into child welfare care. The 1998 Canadian Incidence Study on Reported Child Abuse and Neglect (Trocme, et. al., 2001) (hereinafter called CIS-98) included Aboriginal children in the study sample, as well as three First Nations child welfare agencies. This national study documents the assessments of social workers on reported cases of child abuse and neglect that came to their attention during a three month period. The study captures information on why the child was reported to child welfare, report substantiation rates, child functioning items, caregiver functioning items and case disposition. This study was replicated in 2003 including eight First Nations child and family service agencies in the sample. The CIS -2003 Aboriginal data sample reflects the experiences of 2,328 investigations involving Aboriginal children: 304 First Nations children served by a First Nation's agency, 1,244 First Nations children served by mainstream agencies and 476 Métis, Inuit, and other Aboriginal children. A new feature of the CIS 2003 analysis is that the sample size of substantiated cases was large enough in some cases to compare the experiences of First Nations children on reserve with First Nations children off reserve, other Aboriginal children and non Aboriginal children. To follow is a brief summary of the secondary analysis of the 2003 CIS data respecting Aboriginal children with the full report appearing in Chapter 2.

Building on the Findings of CIS-98

Secondary analysis of the Aboriginal data in CIS-98 revealed that although Aboriginal children were less likely to be reported to child welfare authorities for physical or sexual violence they were twice as likely to experience neglect (Blackstock, Trocme & Bennett, 2004). When researchers unpacked neglect by controlling for various care giver functioning and socio-demographic factors – they determined that the key drivers of neglect for First Nations children were poverty, poor housing, and substance misuse (Trocme, Knoke & Blackstock, 2004). It is important to note that two of these three factors are arguably outside of the domain of parental influence – poverty and poor housing. As they are outside of the locus of control of parents is unlikely that parents will be able to redress these risks in the absence of social investments targeted to poverty reduction and housing improvement. The limited ability for parents to influence the risk factors can mean that their children are more likely to stay in care for prolonged periods of time. This is particularly a concern in regions where statutory limits on the length of time a child is being put in care are being introduced. If parents alone can not influence the risk and there are inadequate social investments to reduce the risk – children can be removed permanently. The third factor, substance misuse, is within the personal domain for change but requires access to services. Overall, CIS- 98 results suggest that targeted and sustained investments in neglect focused services that specifically consider

substance misuse, poverty and poor housing would likely have a positive impact on the safety and well being of these children.

Providing an adequate range of neglect focused services is likely more complicated on reserve than off reserve due to existing service deficits within the government and voluntary sector. A study conducted by the First Nations Child and Family Caring Society in 2003 found that First Nations children and families receive very limited benefit from the over 90 billion dollars in voluntary sector services provided to other Canadians annually. Moreover, there are far fewer provincial or municipal government services than off reserve. This means that First Nations families are less able to access child and family support services including addictions services than their non Aboriginal counterparts (Nadjiwan & Blackstock, 2003). Deficits in support services funding were also found in the federal government allotment for First Nations child and family services (MacDonald & Ladd, 2000.) This report found that the federal government funding for least disruptive measures (a range of services intended to safely keep First Nations children who are experiencing or at risk of experiencing child maltreatment safely at home) is inadequately funded. When one considers the key drivers resulting in First Nations children entering care (substance misuse, poverty and poor housing) and couples that with the dearth in support services, unfavorable conditions to support First Nations families to care for their children emerges.

Although there has been no longitudinal studies exploring the experiences of Aboriginal children in care throughout the care continuum (from report to continuing custody[2]), data suggests that Aboriginal children are much more likely to be admitted into care, stay in care and become continuing custody wards. It is possible that the over representation of Aboriginal children in child welfare care is a result of the structural risk factors (poverty, poor housing and substance misuse) not being adequately addressed through the provision of targeted least disruptive measures at both the level of the family and community. The lack of service provision may result in minimal changes to home conditions over the period of time the child remains in care and thus it is more likely the child will not return home. This is an area for further study.

Findings of CIS 2003

Consistent with the findings of CIS-98, neglect continues to be the primary reason why Aboriginal children are reported to child welfare authorities. Amongst the various forms of neglect, physical neglect and failure to supervise were the most frequently reported. Physical neglect relates to the caregivers failure to provide adequately for the child's needs such as nutrition, clothing, hygienic living conditions. CIS requires that the social worker suspect or believe that the parent is at least partially responsible for the situation.

CIS -03 data suggests that First Nations children on and off reserve have higher rates of child functioning concerns than their non Aboriginal peers. First Nations children on reserve were more likely to be reported as having depression/anxiety, negative peer involvement, misuse substances, irregular school attendance, and to experience a learning disability than their First Nations peers resident off reserve, other Aboriginal children and non Aboriginal children. On the positive front, First Nations children on reserve were less likely to experience ADD, ADHD, inappropriate sexual behaviour, to have a positive toxicology at birth or young offender involvement than their peers off reserve.

In terms of caregiver functioning, it is clear that First Nations caregivers are facing more pressures than their non Aboriginal counterparts. Although First Nations caregivers on reserve are less likely to be single parents than their non Aboriginal peers, they are more likely to rely on benefits for income and to live in public housing, in unsafe housing, and overcrowded conditions. Alcohol abuse continues to be a key factor affecting 44% of First Nations caregivers on reserve versus 58% for First Nations off reserve, 43% for other Aboriginal caregivers and 11% for non Aboriginal caregivers. First Nations caregivers were more likely to experience drug and solvent abuse (44%) versus 10% for non Aboriginal caregivers. However, the

rates for drug and solvent abuse amongst First Nations caregivers resident off reserve were higher at 58% than amongst other Aboriginal caregivers (43%).

In terms of social worker response, cases involving Aboriginal families were two and one half times more likely to be substantiated (49 per thousand) than non Aboriginal families (19.8 per thousand.) In terms of investigative outcomes, cases involving First Nations children were more likely to remain open for services (68%) versus their non Aboriginal peers (41%). Court applications were also more likely for First Nations children on reserve occurring in 10% of cases versus 6% of cases involving non Aboriginal children. Rates for court applications were slightly higher at 13% for both First Nations off reserve and other Aboriginal peoples. When it came to placement First Nations children on reserve were two and a half times more likely to be placed in child welfare care than non Aboriginal children. Specifically, First Nations children on reserve experienced placement rates of 15% as compared to 6% for non Aboriginal children. First Nations children off reserve were placed in child welfare placements in 16% of cases.

CIS -03 compared where Aboriginal children on and off reserve were being placed once admitted to child welfare care. Overall, children on reserve were three times more likely to be placed in either informal kinship care, kinship care or with a family foster home than their non Aboriginal counterparts.

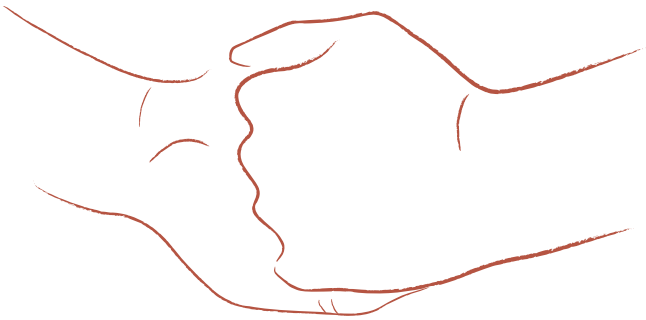
Conclusions

The following concluding statement is taken directly from the CIS report completed for the First Nations Child and Family Caring Society by Trocme et.al. (2005) which appears in full in Chapter 2 of this report:

A number of striking differences emerge from this preliminary comparative analysis of child welfare investigations of Aboriginal and non-Aboriginal children. **From the very outset, Aboriginal children are more than twice as likely to be investigated compared to non-Aboriginal children. Once investigated, cases involving Aboriginal children are more likely to be substantiated, more likely to require on-going child welfare services, more than twice as likely to be placed in out of home care, and more likely to be brought to child welfare court.** The profiles of Aboriginal families differ dramatically from the profile of non-Aboriginal families. Aboriginal cases predominantly involve situations of neglect where poverty, inadequate housing and parent substance abuse are a toxic combination of risk factors. Surprisingly, fewer differences were noted at the level of the children themselves.

The most systematic pattern to emerge from this first analysis highlights the differences between Aboriginal and non-Aboriginal children. It would be helpful to discuss with Aboriginal service providers any on/off-reserve differences that have not been highlighted by this statistical analysis.

Multivariate analyses controlling for some of the differences between Aboriginal and non-Aboriginal families should be undertaken to better understand the factors underlying the differences in service response. **Regardless of these possible explanations, it is apparent that one should expect the cost of providing services to Aboriginal children to be significantly higher given that these cases involve a significantly higher rate of intervention at every point of contact.**



2. JORDAN'S PRINCIPLE: A CHILD FIRST APPROACH TO JURISDICTIONAL ISSUES

Every individual is equal before and under the law and has the right to equal protection and benefit under the law without discrimination and, in particular, without discrimination based on race, national or ethnic origin, colour, religion, sex, age or mental or physical disability
Canadian Charter of Rights and Freedoms, Section 15

The spirit of the Canadian Charter of Rights and Freedoms (hereinafter called the Charter) is reaffirmed by Canada signing the United Nations Convention on the Rights of the Child where non-discrimination is a key principle. These principles in domestic and international law provide a foundation for First Nations children to receive equal benefit under the law and should provide adequate incentive for all levels of government to coordinate their policies and programs respecting First Nations children. Unfortunately, as the United Nations Committee on the Rights of the Child (2003) suggests, the lack of coordination between federal, provincial and territorial governments has left open the possibility of uneven implementation of the objects of the Convention.

This report, completed by Kelly A. MacDonald, a Tsimshian lawyer and child rights expert with the assistance of Kylie Walman provides a synopsis of how case law, international law and inquest findings come together to inform the development of a new funding formula that better reflects the non discrimination provisions of the Charter and the United Nations Convention on the Rights of the Child. Ms. MacDonald uses a combined methodology of literature reviews (both for case law and inquests) supplemented by over 20 key informant interviews.

Findings

The research finds that jurisdictional disputes continue to have significant impacts on the lived experiences of First Nations children – particularly those with special needs. Although both the federal and provincial governments embrace the principle that the safety and well being of the child is a paramount consideration, in practice jurisdictional disputes often supersede the interests of children. **The lived experience of this situation is saliently outlined in the case of Jordan, a young child, in Manitoba who remained in hospital for a prolonged period of time due to jurisdictional wrangling between federal government departments as to which department was responsible for paying at home care costs. A sad update is that Jordan passed away before the jurisdictional dispute could be resolved and never had a chance to live in a family environment – the only home he ever knew was a hospital (Lavalee, 2005).**

As key informants contributing to this research confirm, Jordan's experience with jurisdictional disputes is not unique. Efforts to clarify the responsibilities of the federal and provincial governments have been attempted using the court system but as Ms. MacDonald found, existing case law does little to clarify government roles and responsibilities. Lower court decisions such as the decision by Justice MacInnes of the Manitoba Queens Bench find that there is not a clear fiduciary obligation on behalf of the federal government to fund First Nations child and family services. Additionally, a Manitoba provincial court decision found that the provinces have an obligation to ensure equal benefit under the child welfare law for every child within the province irrespective of their views of federal government responsibilities to First Nations children. This suggests that where there is a gap between what

the federal government will fund on reserve and what the provincial statute requires, the province must step in and fund the service. These lower court decisions, however, must be taken within the broader context of Canada's obligations under the Charter of Rights and Freedoms and the United Nations Convention on the Rights of the Child. Ms. MacDonald notes that although there is no existing case law that specifically explores the implications of federal government under funding of child welfare services, perpetuating inequities in child welfare services through inequitable funding regimes is likely inconsistent with Section 15 of the Charter.

As this report notes, the lack of non judicial forums for the resolution of jurisdictional disputes is a problem. This is also evident in the First Nations agency survey responses which indicated that the **12 agencies had experienced 393 jurisdictional disputes this past year requiring an average of 54.25 person hours to resolve each incident.** The most frequent types of disputes were between federal government departments (36%), between two provincial departments (27%) and between federal and provincial governments (14%). Examples of the most problematic disputes were with regard to children with complex medical and educational needs, reimbursement of maintenance, and lack of recognition of First Nations jurisdiction. There were variations in the responses with some regions reporting higher incidents than others which may reflect the uneven development of dispute resolution mechanisms. Although tripartite tables have been established in some regions with INAC, the province and First Nations child and family service agencies, the efficacy and authority of these tables to resolve jurisdictional disputes is unclear and inconsistent. Moreover, as some jurisdictional disputes involve federal, provincial or tribal authorities outside of these core participants it is critical that mechanisms for engaging these groups are integrated into a dispute resolution process. Importantly, dispute resolution mechanisms must be reflective of cultural values and processes of the participating First Nation child and family service agency.

Conclusion: Jordan's Principle to Jurisdictional Dispute Resolution

There is no way to know if implementing recommendation number 4 of the National Policy Review calling for the clarification of jurisdictional disputes involving special needs children would have prevented Jordan's death, but putting Jordan first would have at least provided him with the best opportunity to live in a family environment. Despite the stated intentions by governments, including Canada, the predominant strategy for resolving jurisdictional disputes affecting First Nations children has been to put the needs of the child on the back burner while governments sort out who is going to assume the costs. In far too many cases the government puts its needs before the needs of the child. The predominance of the child second solution in managing jurisdictional disputes is fundamentally inconsistent with our national values, social norms, laws and international commitments. **The well being and safety of the child must be the paramount consideration in resolving jurisdictional disputes – the child must come first in all instances.**

We recommend that a child first principle be adopted whereby the government (provincial or federal) who first receives a request for payment of services for a First Nations child will pay without disruption or delay when these services are otherwise available to non Aboriginal children in similiar circumstances. The government then has the option of referring the matter to a jurisdictional dispute resolution process. Consistent with recommendations made by the Baby Andy inquest we recommend that jurisdictional dispute resolution tables be established to resolve funding disputes between and within federal, provincial and First Nations child and family service agencies. These tables will receive complaints by parties and recommend a resolution.

In Jordan's memory we recommend that this new child first approach to resolving jurisdictional disputes be called Jordan's Principle and be implemented without delay.

3. LEAST DISRUPTIVE MEASURES AND PREVENTION

Our calculations on the cost of child maltreatment in Canada are as follows:

Judicial	$616,685,247
Social Services	$11,780,062,222
Education	$ 23,882,994
Health	$ 222,570,517
Employment	$11,299,601,363
Personal	$ 2,365,107,683
TOTAL	$15, 705,910, 047

This total reflects a minimum [annual] cost to society…The investment of Canadian governments at all levels in social services directed at this serious problem [child maltreatment] represents only a small fraction of billions of dollars lost every year (Bowlus, McKenna, Day & Wright, 2003 P. v)

The projected cost of child maltreatment respecting First Nations children has not been researched in detail. However, considering that Aboriginal children compose approximately 30-40% of all children in child welfare care and the vast majority of those are First Nations, the annual economic costs in Canada are likely in the billions of dollars per annum. The staggering costs noted in the Bowlus e. al. 2003 study are consistent with data from the United States. According to the World Health Organization (2004) **the estimated costs of child maltreatment in the United States in 2001 are reportedly 94 billion dollars or a full 1% of the GDP for the United States.** Alexander Butchart, WHO Coordinator for Violence Prevention notes that "The good news from this report on the economic dimensions of violence is that, according to cost-benefit studies that have been conducted, violence prevention is cost-effective…. Providing graduation incentives for high risk youth and parents or new parents are, respectively, between seven and five times more cost-effective in preventing violence than investing in increased legal enforcement and incarceration." (WHO, 2003 P. 2).

The 1998 Canadian Incidence Study of Reported Child Maltreatment documented an overrepresentation of Aboriginal children in foster care placements and other institutional settings compared to non-Aboriginal children. Although socioeconomic hardship can account for much of this phenomenon, it has been suggested that funding arrangements may also create perverse incentive effects that work against family-based approaches. **In light of this present situation, more suitable alternatives for ensuring the well-being of Aboriginal children are a priority. Prevention constitutes a significant component of the general holistic philosophy of care in First Nations communities and a number of studies have illustrated that setting priorities in prevention is not only fiscally prudent, but also a humanitarian response to child maltreatment.**

The purpose of this study was to identify best practices and least disruptive measures in primary, secondary and tertiary child maltreatment prevention. For the purposes of this study, primary prevention is defined as the range of population based or community development services provided to prevent child maltreatment. Secondary prevention is the range of services provided to children at risk of experiencing child maltreatment. Tertiary prevention is responding to children who are at significant risk or are experiencing child maltreatment. In child welfare legislation in all provinces tertiary prevention services (often termed least disruptive measures) must be exhausted prior to considering the removal of the child from her/his family.

A secondary goal of this study was to identify a realistic level of cost that can be expected by reducing the number of children in care by filling identified prevention funding gaps in Directive 20-1.

Study Design and Methodology

The conclusions of these reports are informed by a literature review on prevention services which was complemented by a one day focus group of

child welfare practitioners, policy makers and researchers. An additional economic cost benefit analysis utilizing data from West Region Child and Family Services Agency in Manitoba was completed in order to inform what savings could reasonably be expected with investments in prevention services over time. It is important to recognize that as the current funding formula inadequately funds prevention services we were limited as to the number of agencies that this type of cost savings analysis could be conducted on. It is important to note that West Region CFS is a large agency which has been in operation for over two decades meaning it was in an ideal position to optimize benefits of block funding. As Dr. McKenzie (2002) notes there are very few other agencies that could benefit from block funding as their economies of scale are too small or they continue to experience fluctuations in costs year over year making setting the base amount for the block a difficult exercise. However, for the purposes of this costing analysis, West Region provides a good indication as to what would be possible if all agencies had access to a holistic and community based range of prevention and least disruptive measures services.

Summary of Findings

There is a general consensus in the literature that child removal should really be the last resort in responding to child maltreatment. This can only be fully realized if there is a focused investment in all three levels of prevention services (primary, secondary and tertiary.) The NPR (MacDonald & Ladd, 2000) found that the current funding formula inadequately invests in prevention and least disruptive measures. Meanwhile the formula does reimburse for services once a child is removed from their family home. **This means that, in practice, there are more resources available to children who are removed from their homes than for children to stay safely in their homes.** Focus group participants echoed this finding and urged strategic and sustained investments in prevention services which would provide families the best opportunity to have their children remain safely in their homes. These services, however, must be reflective of local culture and context and also consider the broader structural risks that impact on child safety such as community poverty, lack of infrastructure and inadequate or overcrowded housing.

Many First Nations child and family service agencies work with families where the children are experiencing, or are at significant risk for, child maltreatment. Focus group participants see a direct relationship between the lack of primary and secondary prevention options that could mitigate family crisis and the high proportion of families who experience family crisis and child maltreatment. If social workers do not effectively respond to early symptoms of child maltreatment and/or family crisis then problems can escalate both in terms of degree and scope creating conditions where removal of the child is the only option. It is suggested that providing a diversity of primary and secondary prevention services would reduce the scale of crisis-related interventions. Currently these services, if offered, are fragmented and poorly funded. Also the Directive does not allow flexibility to work with other departments to jointly undertake prevention projects – funding agreements are structured in such a fashion that stove piping of services is the end result. This needs to be changed to promote more interdisciplinary and holistic prevention interventions (i.e: development and implementation of programs in partnership with addictions services, health or band schools.)

The classification of prevention in terms of primary, secondary and tertiary as used in the literature is to some extent, incongruent with the notion of holism in Aboriginal terms where program strategies often entail a continuum of overlapping and interlocking child welfare services comprising all three levels of prevention. The new funding formula should encourage a seamless continuum of prevention services that allow children and their families to transition easily between programs.

Overall focus group participants echoed the findings of the literature review. There was general consensus that the current funding formula works against a comprehensive prevention agenda for

First Nations agencies. Participants emphasized the need for an increased investment in all aspects of culturally based prevention programs whilst ensuring the maintenance of prevention programs that agencies have been able to establish. The major outcomes of the focus group were as follows:

- Prevention is conceptualized as a front-end investment in people and should be reflected in prevention oriented legislation and funding arrangements.
- The need for a multidisciplinary collaborative approach to intervention.
- There is a need for a contextual framework encompassing broader community related environmental factors and socio-demographic issues.
- Flexibility and sustainability in funding is needed to support prevention programs which respond to the range of risk factors affecting child safety including structural risk.
- There is a need for adequate funding to build infrastructure and human resource capacity to design, deliver and evaluate prevention programs. This is particularly acute in remote communities.
- Building the FNCFSA human resource base and community volunteer capacity in First Nations communities for prevention programs is identified as a priority.
- The need for development of a comprehensive plan relating to capital requirements such as office space, vehicles and computer systems needed to operate prevention programs needs to be addressed.

Cost-benefit Analysis

A cost-benefit analysis was conducted to determine the realistic savings that can be expected by reducing the numbers of children in care using West Region Child and Family Services as an example. **Consistent with the findings of Bowlus et. al. (2003) and the World Health Organization (2003), the calculations demonstrate substantial returns on spending geared toward prevention. It is important to emphasize that reductions in children in care should be conceptualized as an outcome of programs intended to strengthen families and communities.** It is equally important that artificial means of reducing children in care be avoided. For example, in some mainstream regions reduction in child in care numbers have been achieved by reducing the maximum age children can be in care to 16 years. This approach to reducing children in care is not only poor practice, it is inconsistent with federal age of majority (age 18) and the age of majority set out in the Convention on the Rights of the Child (age 18.) Reductions of children in care need to be conceptualized as a positive long term outcome of supporting healthy families. To achieve this there is a need to re-direct policy in favor of primary and secondary services as a principal component of the casework model, while continuing adequate responses to more complex cases of high risk and family conflicts. The cost-benefit analysis confirms that a shift in focus must be directed to family preservation and reunification wherever possible. **A detailed analysis of the cost benefits of West Regions investment in a continuum of primary, secondary and tertiary prevention services revealed that 1.5 million dollars was saved each year as more children were able to stay safely at home versus being placed in child welfare care. This clearly demonstrates that doing the best thing for children and their families can, over the longer term, result in economic benefits as well.**

Gaps In Formula

Analyzing the current national funding formula from the perspective of the general holistic philosophy of care recommended by First Nations experts reveals a number of significant gaps. One of the key gaps is that the cost of living adjustment in the current formula has not been implemented since 1995. Focus group participants felt that this had resulted in a reduction in overall funding for First Nations child and family service agencies across all service areas including prevention as they could not keep pace with inflation. Their opinion was later validated by the Dr. Loxley's analysis of the cost of living that appears later in this chapter.

Although prevention is a significant aspiration of First Nations agency programming, the funding provided by the current formula is insufficient

to meet needs in primary, secondary or tertiary (least disruptive measures) prevention services. Another complication is that agencies have been disallowed prevention based expenditures that they have billed as a part of the child maintenance. It is an expectation of all child welfare statutes in the country that once a child is admitted to care; the child welfare authority has to provide services to the family and the child to optimize conditions for the child's safe return. In many cases, agencies find themselves in a catch 22 situation – they have inadequate funds in the operations pool to pay for these services and then regional INAC staff would disallow the expenditure if it was billed under maintenance. This means that agencies in this situation effectively have no money to comply with the statutory requirement to provide families with a meaningful opportunity to redress the risk that resulted in their child being removed. More importantly, the children they serve are denied an equitable chance to stay safely at home due to the structure and amount of funding under the Directive. In this way the Directive really does shape practice – instead of supporting good practice. There is a clear need to amend INAC policy, or interpretation of policy, to recognize the need to provide family and child supports to children in care.

The issue of compulsory services under provincial statues versus discretionary programs is also an area requiring further attention. There are several categories of discretionary costs consistent with Aboriginal values such as preventative community development expenditures which are not uniformly reflected under statutory legislative standards and therefore are not funded.

Three broad funding recommendations with the goal of suitably redistributing funds to reflect lower maintenance costs and an increased percentage of funds for prevention and community development or family healing support initiatives are:
1) a multidisciplinary team approach to funding, 2) linking prevention funding to children in care and/or families receiving services and 3) linking prevention to agency capacity to implement and evaluate programs.

Conclusion

Many **First Nations child and family service agencies work with families who could avoid experiencing significant family crisis or child maltreatment if they had received primary or secondary prevention services.** Providing an adequate and sustained amount of funding for the development of a holistic and culturally based continuum of primary, secondary and tertiary prevention services would go a long way to ensuring that child removal is a last resort for First Nations children. This finding is consistent with recommendations made in both the NPR and in CIS-98.

There are strong social work and economic cases for making prevention a priority with substantial fiscal and societal savings. Unfortunately, the current funding formula does not adequately provide for prevention programming and may in fact, discourage prevention by under funding the continuum of services that the operations formula was intended to support. Still, some First Nations agencies have been able to implement successful prevention programs through the diversion of maintenance dollars under a block funding arrangement. As the use of maintenance funds in this manner is subject to uncertainty, it is not an option exercised by all agencies.

A separate budgetary provision is recommended for both primary and secondary prevention. In addition to this a separate budget for least disruptive measures which would include services to children in care so that they can safely return home needs to be established. The efficacy of these programs could be supported by incorporating flexibility in funding use to promote interdisciplinary approaches.

4. MANAGEMENT INFORMATION SYSTEMS

The December 2002 Report of the Auditor General of Canada concluded that First Nations agencies must rely on computer technology to manage currently cumbersome and excessive federal

> **reporting requirements. All agencies agree with this totally and want to have their own information system tailored to their needs for a variety of reasons, but absence of technology funding has been the most major problem. Currently, very few agencies have their own system, and they can barely afford it or keep it working smoothly due to constant lack of funds. (Loo, 2005, P.28)**

Study Design and Methodology

This research report was completed by Stanley Loo who is broadly acknowledged as a leading expert in child welfare information systems having been retained by the Provincial and Territorial Directors of Child Welfare and the University of Toronto, Faculty of Social Work to complete a national child welfare outcomes data project. The specific research questions in the Phase One study were:

1. What kinds of MIS systems are currently in use by FNCFSA and how do they compare with provincial systems?
2. What kind of MIS system is required to meet agency requirements and ensure adequate interfaces with provincial and national data systems?
3. What are the costs of developing and maintaining such a system?
4. What are the implications for a funding formula budget?

Methodological approaches included key informant interviews with eight First Nations child and family service agencies representing all regions except Alberta where we were referred to the province as all agencies use the provincial data base system. Provincial government staff were interviewed from all regions except Quebec and British Columbia where MIS contacts were either unavailable or unknown. Additionally, three external MIS experts who provided services to First Nations child and family service agencies were interviewed.

Summary of Findings

The Auditor General of Canada (December, 2002) has recommended that First Nations make greater use of information management technology to manage federal reporting requirements. FNCFCSA interviewed for this research project are supportive of this recommendation but are unable to implement it due to inadequate funding for MIS in the current funding formula. . Findings indicate a diversity in terms of existing MIS capacity. Additionally, Mr. Loo argues that MIS funding should be linked to agency office structure, location, data collection and management needs and capacity. There is no support for linking MIS to child population as in the current operations formula.

Additionally, findings of this report indicate that, despite the recommendations of the Auditor General of Canada (December, 2002) to streamline reporting requirements using information systems as a tool whenever possible, there is a broad variation in the data management systems being used by First Nations child and family service agencies in Canada. Additionally, most agencies expressed a desire to develop their own data management systems which would facilitate data collection for policy making and evaluation purposes and support the reporting needs of tribal governments, INAC and the provinces. A very small number of agencies have developed these systems and in some cases have licensed the resulting product for use in other First Nations communities. Agency based MIS systems, however, are still the rare exception with the vast majority of agencies having inadequate MIS capability. Currently there is broad variation in MIS capacity within First Nations agencies ranging from pen and paper operations to agency developed information systems. There are also a number of agencies who are using the provincial government's case management system but operate separate data collection regimes to collect reporting data required by INAC. It is likely that variation in MIS capacity is related to the amount of operational funding available to the agency – in general large agencies were in a better position to fund MIS services than small agencies.

Moreover, the structure of agencies varies from single office operations to multiple site structures as do the distribution of agencies in rural, remote and urban centers. Both of these factors – agency structure and location influence the MIS needs of agencies.

Another complicating variable is that First Nations child and family service agencies are often required to report to the provinces and tribal leadership on service quality whereas they need to report to the Department of Indian Affairs in order to sustain funding. Although most provincial governments invite agencies to use their data systems (at no cost or on a fee for service basis) agencies must have adequate computer systems/ staff to take advantage of this option. Moreover the provincial computer system option is limited as the systems are designed with the human resources and MIS capacity of the province in mind and are intended to achieve provincial government data collection and reporting requirements. We have not identified an example where a province involved First Nations child and family service agencies in key design elements of the provincial data collection system. Taken together these issues have resulted in many First Nations identifying concerns with the use of provincial systems. For example, there is no harmonization between provincial data systems and INAC data systems thus agencies experience redundancies in data entry – increasing personnel costs. Additionally, agencies reported navigation problems in provincial systems or with province imposed restricted access to systems modules.

In order to analyze the computer hardware needs of diverse agencies – Mr. Loo proposes linking MIS costs to agency structure, location, data collection and reporting needs according to the following agency typologies:

1. Single agency office less than 75 computers
2. Single agency office more than 75 computers
3. Multiple locations (head office and other branches.

The shortcomings in information management systems impact the ability of First Nations child and family service agencies to collect data that would inform promising policy and practice solutions. As noted by the Nico Trocme (2003) collecting consistent data on children and families coming into contact with the child welfare system is critical to being able to understand what practices are effective in child welfare and which are not. In terms of First Nations child and family service agencies there is limited capacity to collect data on outcomes measures. Current data collection is often restricted to that required by INAC and child welfare regulatory agencies. INAC reporting requirements for FNCFSA vary depending on the funding methodology used but as the Auditor General of Canada (December, 2002) reports, information collected by INAC generally consists of a Child Care Notification Form which is submitted by the FNCFSA on the 10th day of every month in order to receive reimbursement of expenses. The form is completed when the child is removed from the home and requires the following information:

- Child information (name, date of birth, address and health insurance number)
- Date of removal and residence of the child at time of removal
- Legal status of the child pursuant to provincial statute
- Parental information including information on legal custody and Indian status
- Identity of the caregiver if someone other than the birth parent
- Identify of fiscally responsible entity (i.e: provincial child welfare, INAC, health, justice, etc.)

Consistent with the concluding remarks to Canada made by the United Nations Committee on the Rights of the Child (2003) disaggregated data would provide some guidance to First Nations child and family service agencies on children in care but the data INAC currently collects was not designed to inform policy and practice decisions on critical factors such as why the children are coming into care, services provided to children at risk while living in the family home, longitudinal experiences of children post removal. It is important to note that although INAC collects some child welfare

data for its financial reporting purposes, it is not consistently reported in public documents at a regional or national level. This limits the policy impact of even the limited amount of data that is currently collected. The further development of MIS capacity in First Nations child and family service agencies will augment their capacity to collect outcomes measures on children and families coming into contact with child welfare thereby informing evidence based policy and practice solutions.

Conclusions:

We recommend that each agency be assessed for capital MIS equipment and infrastructure needs in order to bring them to the minimum standard recommended by Stanley Loo in his report. Moreover, the new formula should include adequate funds for MIS staff training, system upgrades and maintenance.

In addition to these recommendations, Stanley Loo offers the following conclusions taken directly from the report completed for the First Nations Child and Family Caring Society:

1) How to determine how much an agency needs to acquire an information system is a critically important but exceedingly complex issue. Determining technology costs goes way beyond, for example, counting number of workers or cases served, or size of on-reserve child population. The kind of computer equipment needed, hence the cost, is mainly determined by:

- The type of information system an agency needs and the features desired.
- Adequacy of computer equipment in use, i.e., which existing computer hardware and software items need to be upgraded or replaced, and what additional equipment is needed.
- Geographical spread (number of locations) of the organization.
- Size of the organization.

The third and fourth conditions also influence the design of a technological infrastructure needed to support an agency's information system. These four factors are the key determinants of technology costs in the case of FNCFSAs.

2) The report also shows that the cost of an information system or database application itself is actually quite small, compared to the cost of the technological infrastructure required. However, it is extremely important that the right database application is used otherwise serious usability problems will surface sooner or later.

3) In making decisions concerning selecting an information system, identifying the types of computer hardware, software and related requirements, and estimating costs, it is always useful, and actually important, that agencies follow a consistent framework. Otherwise agencies could easily lose sight of the purpose of an information system and/or end up acquiring inappropriate technology. For this reason, the report includes a number of checklists or sets of criteria for, respectively:

- Helping an agency to determine the adequacy of its existing hardware and software, as per requirements of a typical agency-level information system,
- Helping an agency currently without its own information system to decide whether to develop its own system or to lease a commercial system.
- Showing an agency how to select a commercial information system.
- Helping an agency to identify the "typical" mix of computer hardware, software, peripherals, remote access options and associated considerations needed to build a technological infrastructure based on agency size and geographical spread. (Suggestions for technology refresh are also included.)

In addition, two other sets of information are included:

- Information system or database features deemed essential for meeting expectations regarding outcomes measures, program performance monitoring, electronic data exchange, ad hoc data or report requests, etc.

These are above and beyond day-to-day agency service delivery and management requirements.

- Prevailing cost (regular price as well as special discounted price for charitable organizations, where available) of each hardware, software, or service item. Most of the hardware and software prices are standard across Canada, although service charges may vary between regions and/or suppliers.

4) Given the high degree of complexity of the subject, it is important to treat this framework of information or checklists as educated guidelines, which may require adjustment when they are applied to individual agencies. Situational needs and other factors hitherto unknown or that may surface later, as well as constant technological advances necessitate periodic adjustment to this set of information to ensure currency and continual applicability. It is also suggested that agencies engage a technical consultant to help identify the specific technology they need to match agency characteristics, using the checklists as a reference guide. This person should be familiar with Microsoft server products, database development, computer hardware, and infrastructure design and implementation.

5. EXTRAORDINARY COSTS AND JURISDICTIONAL DISPUTES

Under the current formula, First Nations child and family service agencies are reimbursed for child welfare services provided to Status Indian children on reserve. Unlike the provinces, First Nations child and family service agencies operate on a budget that should theoretically zero out at the end of each fiscal year –there is no process in the Directive to deal with cost overruns or unexpected costs. As Dr. Cradock notes the problem is that the costs of child welfare are not predictable enough to respond to this rigid zero based funding structure in the formula. Provinces also typically receive an annual fixed budget, but they can also appeal to the provincial treasury board or a similar structure for additional funding should an unexpected event occur. First Nations child and family service agencies do not have this type of safeguard.

Additionally the overall under-funding of First Nations child and family service agencies mitigates their ability to respond effectively to what would be "normal" circumstances in provincial child welfare systems (e.g: changes in legislation or special protocol investigations (such as investigating child welfare staff) and thus the realm of what is considered an extraordinary expense expands.

Community infrastructure also impacts conceptions of what is, and what is not, extraordinary. The fact that First Nations have varying degrees of community infrastructure influences their ability to respond within and across community services to extraordinary events. This report reviews the nature of extraordinary circumstances whilst providing recommendations for response.

Study Design and Methodology

The information for this study was gathered from a review of literature, a review of policies from nine provinces (British Columbia, Alberta, Saskatchewan, Manitoba, Quebec, Nova Scotia, New Brunswick and Newfoundland) and survey data from 12 First Nations Child and Family Service Agencies.

Findings

The report begins by outlining two primary challenges when examining extraordinary circumstances:

1) the boundary between extraordinary costs and jurisdictional disputes is not always clear
2) The conceptualization of what is an ordinary or extraordinary event is significantly linked to the First Nations community context in which the event occurs. Thus it is critical to understand the community context in order to

judge whether or not something is extraordinary or not.

In terms of interface between extraordinary costs and jurisdictional disputes, aggregated survey results from First Nations child and family service agencies indicates that eleven of twelve agencies in the sample experienced jurisdictional disputes. Taken together they reported 393 jurisdictional disputes this past year. The frequency of these disputes varied widely with agencies reporting anywhere from 1 to as many as 165 disputes within a year. The amount of time and human resources taken to resolve these disputes was in itself extraordinary. Over the duration of one year, the resolution of each dispute took an average of 54.25 person hours with some disputes taking up to 200 hours of staff time to sort out. The human resource costs related to resolving jurisdictional disputes make them an extraordinary cost for agencies which is not covered in the formula.

Although it is fair to say that provincial child welfare agencies also experience jurisdictional disputes, FNCFSA face the additional burden of sorting out the federal/provincial jurisdictional disputes arising from Section 88 of the Indian Act or disputes between different federal government departments over the funding of services to Status Indian children that are not likely to occur at the same rate or in the same form for provincial governments. This is typified in the FNCFSA survey responses with six of the nine responding agencies reporting persistent disputes between the federal government Departments of Indian and Northern Affairs Canada (INAC) and Health Canada over funding for non-insurable medical costs. Problems with jurisdictional disputes between federal departments are more likely to occur for agencies responsible for remote communities. These types of disputes delay or withhold necessary non-insured health benefits. Children with complex developmental, mental health and physical health issues are particularly impacted by the resulting delays in service.

The second type of jurisdictional dispute, reported by four agencies, is between the federal government and provincial child welfare agencies. The principle disputes in this area revolve around figuring out which government (federal or provincial) is responsible to fund child welfare services which are required by provincial statute or policy but are not funded by INAC within current authorities. This type of dispute was reported by a third of agency respondents who indicated that these disputes consume a considerable amount of agency time.

Consistent with the findings of Irvine (2004), this report found that the unique context of First Nations communities directly influences the definition of what is and what is not an extraordinary circumstance. Given the variance in geography, community size, access to services and degree of community social development there are vast differences in conceptions of extraordinary amongst First Nations and between First Nations and the rest of Canada.

In comparison with other Canadians, the high levels of socio economic need, the experience of colonization and the comparative lack of service infrastructure means that many events that would be described as extraordinary in the overall Canadian context are ordinary in the First Nations experience. For example, best estimates indicate that one in ten Aboriginal children are removed by child welfare authorities whereas the rate for non Aboriginal children in one in four hundred; graduation rates for non Aboriginal children are three to four times higher than for First Nations children. This boundary between extraordinary and ordinary is complicated. The assignment of "ordinary" to circumstances experienced by First Nations children and families which would be extraordinary by other Canadians can serve to normalize the perception of the risk and moderate the type of urgent response one would expect from all levels of government.

Similarly, First Nations also have diversity in contexts, cultures, community development and history that impact on their definitions of what is extraordinary and their ability to respond thereto. For example, what may be described as ordinary in a remote First Nations community may constitute the extraordinary in an urban First Nation. For example, one remote community described how social workers had to pass by bears and travel

over partially thawed ice to get to a community in the spring time. Although dodging the bears is an everyday activity for a remote community it would likely be an extraordinary circumstance in an urban community. The reverse is also true, what may be considered ordinary in an urban First Nation may be extraordinary in an isolated community. For example for one urban First Nation in this sample reports that it has no less than four types of transportation lines cutting through their reserve lands creating hazards for children and adults alike.

A community capacity assessment is proposed as a means to gage community context and ability to respond to extraordinary circumstances and to help distinguish between ordinary and extraordinary local events

Incidents of extraordinary costs were reported by six agencies in the FNCFSA survey. Agencies reporting extraordinary costs reflect the concerns expressed with jurisdictional disputes in the sense that extraordinary costs are associated with isolated and high needs communities. Reported costs are primarily related to travel associated with providing services in extraordinary circumstances or due to costs linked with lack of specialized services and resources and costs.

Events that are unanticipated, unforeseen or outside normal risks are not reflected in the First Nations survey data on extraordinary costs although key informant interviews identified incidence such as a series of youth suicides as being an extraordinary event. The survey data suggests that what is considered extraordinary is a body of predictable and repetitive events for which agencies are currently unable to respond due to funding issues or established jurisdictions cannot or will not take responsibility.

Conclusions

Much of what is considered within the parameters of jurisdictional disputes and extraordinary costs are in fact neither. Instead, in approximately half the cases these disputes and costs are actually problems related with under funding. More specifically, lack of funding for the particular circumstances of certain agencies. Degree of community isolation appears to be a variable in both jurisdictional disputes and extraordinary costs and agencies serving isolated communities are particularly impacted. In addition to the following recommendations proposed by Dr. Cradock, the research team endorses the recommendation by Kathryn Irvine (2004) that funds be set aside to promote inter-agency cooperation in extraordinary circumstance reports such as investigations of staff members or incidents of multiple abuse.

The recommendations based on the findings of this study are:

1. Community Capacity Assessments:

Community capacity assessments are recommended as a means of distinguishing between ordinary and extraordinary local events and as a means of assessing the particular needs of communities serviced by agencies. These assessments would also include an inventory of existing resources and infrastructure that could be activated to respond to exceptional circumstances. This assessment would provide a baseline for the assessment of First Nations child and family service agency requests for extraordinary circumstance funding.

Prevention is, of course, the best strategy for avoiding jurisdictional disputes and community capacity assessments may be instrumental in this regard. It is strongly recommend that a change in the current federal funding to First Nations child welfare agencies must include a provision for community capacity assessments.

2. Committee Structure

From the perspective of jurisdictional disputes and extraordinary costs, a major recommendation is for improved relationships between Health Canada and INAC. Increased cooperation between these agencies would save considerable effort and expenditure agencies are currently taking on. The establishment of interagency committees with an independent discretionary budget for family and children's services may be instrumental in helping to resolve disputes and sustain the process of networking and cooperation

between staff and government departments.

3. Funding For Mediation

A funding mechanism to provide mediation services for jurisdictional disputes where applicable is suggested. This would provide a separate budget which agencies could utilize to engage a mediator in the resolution of jurisdictional disputes.

4. Increased Funds For Travel

Increased funding for travel is required particularly for agencies serving remote communities even for day to day operations let alone extraordinary circumstance response. The formula for operational funding must reflect actual demands placed on agencies by various provincial legislative requirements. As agencies do not have control over shifts in provincial legislation and policy, the operational formula will require regular scheduled reviews to monitor changes in provincial requirements.

5. Establishment Of A Central Extraordinary Circumstances Budget

Establishment of a central budget administered either by INAC or by a committee system to ensure adequate funding for agencies on an as-needed basis. Extra costs generated by special institutional care, is one example of where these funds would be directed. As well, the funding formula for maintenance should be adjusted to recognize the real incidents of complex special needs amongst on reserve children in care. The formula should take into account both residential costs and costs for the purchase of necessary professional support. The research team recommends that this amount be set at an initial, and minimum, value of 2 million dollars to be adjusted annually according to volume and price.

6. Consideration Of Legal Liability

Considerations must be made for the potential extraordinary costs related to liability exposure stemming from the discrepancy between agency's legal responsibility to protect children and level of resources to fill this legal mandate. This is of particular concern for agencies serving isolated communities where there is a gap between the agencies legal responsibility to protect children and the actual resources available to do the job.

7. Independent Advocate

A formal independent advocate representing First Nations children would ensure the voices of First Nations children are heard and that resources designated for the maintenance of these children are not diverted elsewhere such as to the resolution of jurisdictional disputes. The advocate must have an investigatory mandate and access to federal decision-making processes.

6. FIRST NATIONS CHILD AND FAMILY SERVICE AGENCY SURVEY RESULTS

A key research methodology used in this report was to conduct a detailed survey of 12 First Nations child and family service agencies. These agencies were selected on the basis of the following criteria:

1) Balance of urban, rural and remote locations
2) Francophone and Anglophone agencies in Quebec
3) Balance of small, medium and large agency sizes
4) Fully delegated and partially delegated agencies in British Columbia
5) Two agencies in each of six regions (BC, Alberta, Saskatchewan, Manitoba, Quebec, Atlantic (New Brunswick and Nova Scotia)

All agencies were compared against these criteria and a sample of 12 agencies was selected and presented to the National Policy Review Funding Design Team who finalized the selections. Taken together the agencies broadly reflect the diversity of First Nations child and family service agencies.

The surveys were completed by the First Nations child and family service agencies with the assistance of a researcher in each region. All regional researchers received training on the use of the standardized survey instrument and were also supported by a researchers guide to ensure standardization of process and ability to compare results across surveys. Confidentiality of survey responses is ensured through the presentation of findings in aggregate form only.

Findings

To follow is a summary of the aggregate agency survey responses by major research category. Please be advised that in some cases agency surveys were considered along side the findings of a separate research project to inform the conclusions and recommendations regarding the funding formula options.

Please also be advised that the number of responses for some questions is more or less than the sample size of 12 agencies. For example, some agencies may have multiple offices so in questions relating to office space there may be more than 12 responses or if the question relates to remoteness not all agencies will be in remote locations so the number of responses will be reduced.

In reviewing the findings and consulting with the regional researchers it was clear that many agencies had difficulty estimating the costs of services that they would like to provide but do not currently provide. This is not surprising given that accurate program costing would entail knowing the design of the program, the setting in which it is being implemented and then costing out the budget associated with this program.

A. General Background Question

The vast majority of agencies in the sample were fully delegated (91.7%) and were therefore delivering the full range of child welfare services. Only one agency was operating under the partially delegated model providing guardianship, voluntary care agreements and family support services.

First Nations agencies report a misalignment between what the Directive funds and what the needs of the community are. The developmental approach contained in the Directive for the development of new agencies requires a community needs assessment but does not in any way link funding to it. First Nations agencies in the sample were asked if they had ever conducted a needs assessment of the community in relation to child welfare services. Three quarters of the agencies had completed such an assessment suggesting that if a more needs based approach was undertaken many FNCFSA have at least a baseline for knowing what the community needs are.

Records management requirements and mechanisms have evolved significantly over the fifteen years the Directive has been in place. This is in tune with an increased public and legal sensibility related to confidentiality and client access to records. 91.7% of the agencies stated that they have a records management policy for child-in-care files which were guided by laws or

Table 3: Cultural Placement Match For Children In Care Of First Nations Child And Family Service Agencies

Placement Type	Number of Responses for Placement Type	Number of Children in Placement Type	Number of Responses for Cultural Match	Cultural Match (%)
Kinship Care / Family Placement 'restricted'	8	257	8	99.75%
Non-relative foster home	7	127	7	63%
Respite care home	10	0	10	100%
Group home	5	48	2 (10 children)	20%
Institution	7	49	7	17.85%

regulations covering the storage of child-in-care records in their agency. There is currently no specific funding in the formula to account for statutory or regulatory requirements regarding records management.

B. Children in Care

When asked if the amount of funding provided under the funding formula is adequate to meet the need of children in care, only 33.3% of the agencies said yes. Of the 33.3% of the agencies which responded yes, 8.7% indicated that the formula is adequate to meet the needs of the children in care, so long as that funding that is provided in a block funding arrangement – the other 25% of the agencies did not indicate why they felt funding was sufficient. An overwhelming 66.7% of the agencies indicated that there was inadequate funding in the formula for children in care particularly in relation to prevention services and in home supports.

Many First Nations child and family service agencies have indicated that one of their primary objectives was to place First Nations children in care in culturally matched placements. As Table 3 indicates, First Nations child and family service agencies have to their great credit, largely achieved that goal. Please note that the number of responses to individual questions varied thus we have indicated the number of responses for each placement type identified in Table 3.

The provinces do not uniformly collect information on cultural match so comparative statistics are difficult to access. The British Columbia Children's Commissioner found in 1998 that only 2.5% of Aboriginal children in the care of that province were placed in culturally matched homes despite a statutory obligation to give preference to Aboriginal homes (British Columbia Children's Commission, 1998).

When asked what, if any, impact increased investment in prevention and least disruptive measures services would have on children in care numbers over time, most agencies felt that over time the numbers of children in care would decrease. Estimates of the reduction of children in care over ten years averaged at about 50% but some agencies noted that there might be shifts in categories of care with fewer children entering care by court order and more by agreement as parents increasingly access support services.

The agencies were unanimous in their belief that increased investments in prevention and least disruptive measures services would benefit children in continuing custody (in care under court order until the child reaches the age of majority.) A response by one agency was echoed in the responses of the others:

"Children in care would emotionally/ psychologically improve because their family or

caregivers would be functioning better – their placements in foster care would be more stable. Since many children are placed in their communities with extended family members, these children would have more access to their natural family through increased visits. In some cases, permanent orders of guardianship could be rescinded after a successful trial reunification and these children could be discharged from care and returned to their natural families"

Other expected benefits include:

- Support the child in reestablishing family and community relationships
- Programs to support the cultural identity of the child
- Assistance with preparing the child for independence by creating a holistic continuum of support around the child.
- It may be possible to return some children to their parents with support.
- Quality of life supports such as personal and family counseling

Key informants advise that the degree to which INAC allows for reimbursement of prevention services related to children in care varies widely between regions. Prevention and least disruptive measures clearly have benefits for both children at risk living at home, children in temporary forms of care and children in permanent care. INAC Treasury Board authorities should be reviewed to ensure that an adequate and equitable full range of prevention and least disruptive measures are available across the country.

C. Board Costs (Incorporated Boards and Advisory Boards / Committees)

Incorporated Non Profit Agencies

Among the 12 agencies surveyed a large proportion (75%) are registered non profit organizations with a board of directors. Of these nine agencies, 58.3% of the non profit agencies indicated that they have a special honourarium or travel cost policies for Elders who are members of the board of directors. Board members were paid honourariums for service in addition to reimbursement for travel costs for service in 66.7% of the cases.

In addition to operating a board of directors, 56% of the 9 non profit agencies had community advisory board/ committee (s). When asked if advisory board members receive an honourarium for sitting on the advisory boards, 20% of the agencies said yes, yet 40% said no and 40% did not provide an answer. The survey also asked if the advisory board members receive reimbursement for travel expenses related to their duties as advisory board members, and though 20% of the agencies responded yes, 60% answered no and 20% of the agencies did not respond. Special honourarium and travel policies were in place for Elders in 20% of these agencies - another 40% did not have this policy and the remaining 40% did not provide an answer.

When the survey inquired if the amount of funding provided under the funding formula is adequate to meet the needs of non profit board governance 44% indicated that funds were not sufficient and 56% did not provide an answer.

Agencies Operating under other Governance Models

For those agencies operating under a different governance model (i.e: reporting directly to Chiefs and Council or to the Tribal Council), the survey asked about the existence and costs associated with advisory committees. Amongst the 25% of agencies that used a governance model other than an incorporated non profit, 66.7% indicated they had community advisory committees, whereas 33.3% indicated they did not. Further, when the not registered non profit agencies were asked if their advisory board members receive reimbursement for travel expenses related to their duties as advisory board members, 33.3% replied yes, 33.3% replied no, while 33.3% did not provide a response. Also, 33.3% of the agencies indicated that they have special honourarium or travel cost policies for Elders who are members of the advisory board, however, 33.3% said no, while 33.3% did not provide an answer.

When asked if the amount of funding provided under the funding formula is adequate to support their governance needs, 66.7% of the agencies replied no, while 33.3% did not respond – none of the agencies replied yes.

D. Legal, Capital Costs and Insurance Costs

First Nations child and family service agencies incur a number of capital costs ranging from office space, staff housing, vehicles, and equipment costs. Legal costs for an agency range from corporate legal costs (maintaining incorporations, human resources, liability insurance) to child in care legal costs. Insurance for a FNCFSA should include policies typical of corporate insurance (fire, theft, "household" liability) but should also include liability insurance related to child welfare itself. Agencies were asked about all three of these issues in the survey.

In terms of capital costs, the NPR indicated that there was no money in the formula that was specifically targeted for capital costs. Although there were funds included for office rent, costs associated with renovations, staff housing, capital investments in technology were not included. The FNCFSA survey results below indicate that although agencies have tried to make do with the current allotment there are deficits in accessibility and adequacy of both office space and staff housing costs (for remote communities).

In terms of staff housing, 25% indicated that their agency provided housing for staff, while 66.7% of agencies revealed that their agency did not and 8.3% of agencies did not respond. Remote communities were more likely to provide staff housing than agencies in rural or urban areas. Among the 25% of agencies who provide staff housing, 33.3% indicated that their agency charges for staff housing that the agency provides, while 66.7% of the agencies indicated that they do not. Accessibility of staff housing for disabled persons was a concern as 67% of agency housing is not accessible.

The survey also asked agencies if the amount of funding provided under the funding formula is adequate to meet the housing needs of staff. 75% answered no and 16.7% did not supply a response and 8.3% stated that this question was not applicable. Of the 75% who answered no, 16.7% revealed that between $900,000.00 and $1,650,00.00 is needed to either repair existing staff housing or to build new housing for staff.

Accessibility of agency office space was also a problem. The National Building Code of Canada contains the following two articles specific to building accessibility for disabled persons

A1 - Barrier-Free Path of Travel

An objective of this Code is to limit the probability that, as a result of the design or construction of the building, a person with a physical or sensory limitation will be unacceptably impeded from accessing the building or circulating within it.

A2 - Barrier-Free Facilities

An objective of this Code is to limit the probability that, as a result of the design or construction of the building, a person with a physical or sensory limitation will be unacceptably impeded from using the building's facilities."[3]

Despite the requirements of the National Building Code of Canada, one third of the agencies indicated that their buildings were not accessible to persons with disabilities (31.2%). It is important to note that if the building is not accessible for persons with disabilities it is likely that the building is also inaccessible to persons with child strollers thus limiting access to the very children the agencies are attempting to service. Amongst those who responded that their buildings were not accessible to the disabled, lack of funding to do the needed renovations was identified as the key reason why the buildings were inaccessible. To our knowledge, First Nations child and family service agencies have not been given specific and targeted funds to ensure their space is accessible for persons with disabilities.

When asked if agencies felt their office space

provided a safe and child and youth friendly environment, 71.4% of agencies answered yes and 28.6% answered no. One agency is operating in a building that is beyond repair. Overall, the overwhelming majority of agencies (91.7%) felt that they did not have adequate funding in the current formula to meet their office space requirements.

It was clear from these respondents that First Nations were providing significant support to the agencies in terms of providing or supplementing office space costs. Specifically, 25% of agencies indicated they received their office space free of charge whereas 8.3% responded that a partial subsidy was provided.

It is recognized that proper maintenance of workplace vehicles is critical for reducing employee injury and in the case of social workers transporting clients, injury to community members as well. Despite the need for proper workplace vehicle maintenance, FNCFSA indicate that capital travel costs are a critical need. The agencies that provided company vehicles were asked to indicate if they have sufficient funds within the current travel amount provided in the funding formula to ensure their company vehicles are properly maintained and safe for road conditions, only 8.3% of the agencies said yes, while 41.7% said no, 25% specified that this question was not applicable and 25% did not respond.

When it came to staff using their own vehicles for business purposes, 66.7% of agencies agreed that the transportation allowance in the current funding formula intended to cover staff costs for the use of personal vehicles was inadequate. Although agencies were not specifically asked what mileage rates they provide to staff, comparable benchmarks are the rates set by the American Automobile Association and the Treasury Board of Canada. The American Automobile Association estimates that it costs 56.2 cents per mile US to operate a new vehicle in 2005 (Internet Auto Guide, 2005). Treasury Board of Canada mileage reimbursement rates vary from a low of 41 cents per km in Saskatchewan to a high of 52.0 cents per km for the Yukon, the mean rate is 45.8 cents per km (Treasury Board of Canada, 2005.) The under funding of workplace vehicle travel is a critical issue given that workplace safety regulations frequently require employers to ensure proper vehicle maintenance with an increasing number of provinces passing laws to ensure the safe transportation of children (e.g.: baby/toddler car seat requirements). The failure to provide adequate funding not only has implications for workplace safety it also introduces the possibility of children in care and their families being in harms way when transported in vehicles which are not road worthy.

Finally, when the agencies were asked if they felt they had adequate funds for other types of capital expenses (i.e. computers, photocopies, office furniture, office equipment), 75% of the agencies that answered no and 25% responded affirmatively. The need was particularly critical for information technology related capital expenses with some agencies reporting there was no funding to support purchase and upgrades for information technology equipment.

Overall, agencies in the sample report significant difficulty funding capital expenditures within the current formula. Moreover, a review of workplace safety regulations and federal building code standards indicate that the under funding of capital expenses may place agencies in a position where they are out of step with workplace safety and accessibility legislation/standards.

E. Management Information Systems

Consistent with Stanley Loo's report, the Auditor General of Canada (December, 2002) has called for significant investments in management information technology for First Nations to assist them in adhering to federal reporting requirements whilst introducing efficiencies in how reports are produced. The current funding formula was developed in 1989, prior to there being any significant use of information systems amongst First Nations child and family service agencies hence information technology costs (capital, maintenance or training) were not included in the original formula. Reports from agencies indicate that they have drawn from the already stretched operations funding to pay for

information technology needs. **Survey results indicate that 66.7% of agencies have some form of management information system whereas 33.3% indicated that they did not. This means that a full one third of agencies surveyed had no computer information management systems.**

When asked if the current funding formula adequately covers costs for MIS, 58.3% said no, 16.7% said yes, and 25% of the agencies did not respond to this question. The agencies who answered no indicated that additional funding was absolutely necessary for services such as, technical support, IT personnel, hardware upgrades, links between an agency's main office and its satellites offices and the creation of an information system for case management. The cost of these services was estimated to be between $60,000.00 and $600,000.00 per agency.

F. Programs and Services

This section of the questionnaire described the child population served by First Nations child and family service agencies. In addition, questions were asked regarding the range of services each agency provided and what services each agency would like to provide in optimal circumstances.

In terms of who is receiving services from the agencies, in addition to serving Status Indian children on reserve, survey results indicate that (83.4%) of agencies provide services to non status First Nations children on reserve. 8.3% of the agencies offer partial services and the remainder provide no service. Agency responses indicate that reimbursement from the provinces is not adequate in one third of cases (33.3%) whereas 53.3% did receive adequate funding and the remainder indicated the question was not applicable to their agency.

Furthermore, 58.4% of the agencies indicated that they provide services to non Aboriginal children resident on reserve, while 33.3% of the agencies revealed that they do not offer these services and 8.3% of agencies did not respond to this question. Agencies reported that under-funding for services provided to these children by the provinces was even a more serious concern than with non Status First Nations children with only 33.3% reporting adequate funding, 8.3% of the agencies did not respond to this question and a majority (58.4%) indicating inadequate funding by the province to provide these services.

G. Remoteness Factor

First Nations child and family service agencies operate throughout the country including in remote areas. This section of the questionnaire focused on exploring the adequacy of the current funding formula in covering the costs of providing child and family services in remote First Nations. Issues such as remoteness related salary; capital and operational costs were explored.

At the beginning of the survey 33.3% of agencies stated that their agency services remote communities. Of the 33.3% of agencies that service remote agencies, 25% indicated that they offer a salary incentive for staff working in remote locations, while 75% revealed that they do not provide salary incentive. Further, when these agencies were asked if they covered any exceptional moving costs associated with new staff being posted in a remote location, 50% responded yes and 50% responded no.

Agencies were asked to estimate the costs associated for remoteness in five areas, the number of respondents (N) varies with each question and thus it is indicated in each situation.

1) Estimated annual shipping costs for goods and services related to remoteness. N=3 Average cost: 155,233.33
2) Estimated annual cost for buildings and utilities related to remoteness. N=2 Average cost: 13,570.
3) Estimated annual travel costs to government services. N=3 Average cost: 66,666.66
4) Estimated additional staff travel costs per year related to remoteness that are not covered by the maintenance budget. N=3 Average cost 36,666.66
5) Estimated annual cost of transporting children in care related to remoteness not covered by

Table 4: Minimal Educational Requirement By Staff Position In FNCFSA

Occupation	Minimum Reported	Maximum Reported	Most Frequent Requirement
Executive Director	College Diploma	Master Degree	Bachelor/Master Degree (78%)
Clinical Supervisor	Technical Training (non diploma)	Master Degree	Bachelor of Social Work (72.7%)
Direct Protection Workers	High School	Bachelor of Social Work	Bachelor of Social Work (BSW) (54.5%)
Prevention Workers	High School	Bachelor of Social Work	High School (18.2%) and BSW (18.2%)
Permanency Planning Workers	High School	Bachelor of Social Work	College Diploma (18.2%), University Degree (non BSW) 18.2% and BSW (18.2%)
Foster Home Workers	High School	Bachelor of Social Work	BSW (45.5%)

* These 2 agencies receive delegation training that is partially subsidized by the province.

the maintenance budget. N=2 Average cost 33,500.00

Finally, of the 33.3% of agencies which stated that they serve remote communities, 75% answered no when asked if the current remoteness factor in the funding formula is adequate to offset any additional costs to the agency, while 25% did not provide an answer.

H. Staff Salary and Benefit Levels

Throughout the National Policy Review process, First Nations child and family service agency representatives have consistently raised concerns regarding the adequacy of funding in the Directive for staff salaries and benefits. This section of the survey explored adherence to human resources standards/laws, comparability of salaries and benefits to the province and the overall adequacy of funding in the Directive to support human resources costs.

The survey asked questions about the minimal education qualifications of staff in various positions. Table 4 contains a brief summary of the results in key occupations.

Agencies were then asked how many of their staff actually have the minimal educational qualifications in various positions. Table 5 on the next page is a brief summary of results in key occupations, please note ten agencies responded to this question:

Agencies noted that social workers require additional non academic training to work effectively in their communities. Survey responses indicate that the types of training are diverse (there were 38 different types of training identified by the 10 agencies who completed this section.) Table 6 lists the most frequent types of training and the associated cost per worker.

The survey asked agencies if the FNCFSA had a human resource manual that includes salary levels and benefits, 75% of the agencies reported having a human resource manual, whereas 25% of agencies do not. The survey went on to ask if agencies were confident that their human resources policies and procedures met applicable labor laws and regulations. One half of agencies said that their human resource manuals were in compliance whereas, 25% said no, 16.7% responded 'partially' and 8.3% indicated that this question was not applicable.

Table 5: Percentage Of Staff Meeting Minimal Educational Requirements Of FNCFSA

Occupation	Percentage of Staff Meeting Qualifications	Percentage of Staff not Meeting Qualifications
Executive Director	77.8%	22.2%
Clinical Supervisor	100%	Nil
Direct Protection Workers	77.8%	22.2%
Prevention Workers	66.7%	33.3%
Permanency Planning Workers	88.9%	11.1%
Foster Home Workers	77.8%	22.2%

Table 6: Training Costs by Staffing Position

Training Program	Number of Agencies Reporting Need for this Training	Cost per Worker
Delegation Training	5	$1500-2000* (2 agencies) $1500-9000 (3 agencies)
Cultural Education	4	$100-500 (2 agencies) $1000 (1 agency) Unknown (1 agency)
Sexual Abuse Training	3	$100-300 (1 agency) $1000 (1 agency) $1500 (1 agency)
Computer Training	2	$1000 (1 agency) $24,000 (1 agency)
Child Abuse Investigations	2	$2500 (1 agency) $10,000 (1 agency)
Family Conferencing	2	$100-300 (1 agency) $420 (1 agency)
Suicide Intervention	2	$1000 (1 agency) $1,200 (1 agency)

Feedback from key informants during the survey development process indicated that overtime compensation for staff working after hours on child protection matters was a critical area of concern, thus a question specific to over time compensation was included in the survey. When agencies were asked if their overtime compensation policies complied with applicable labor regulations, 50% of the agencies answered yes, 41.7% answered no and 8.3% stated that this question was not applicable. Overtime compensation rates varied widely from a flat rate of $50.00 per call to a flat rate per week on call plus time and a half for hours worked. After hours provisions would apply to social workers as well as staff providing clinical supervision. Survey responses indicate that the clinical supervisor is often on call (75%) to provide advice to social workers and in their absence executive directors, contracted supervisors and senior social workers fulfill this role.

In terms of the degree to which the agency can assure social worker safety after hours, 2 agencies said they cannot currently ensure staff safety; the majority relied on local police or the RCMP. Other approaches included employing a buddy system to make sure no worker went out alone, to using community contacts, providing cell phones and workplace safety training. Social workers have to intervene in some of the most difficult of family circumstances, including situations where adults

and youth are impaired – provision of funding within the human resources envelope to ensure their safety is critical.

Predictably there was some variation in caseload size and case composition according to the structure of the agency. In some agencies social workers perform all duties whereas others have adopted a more specialized approach with targeted investigation, family support and permanency planning and intake workers. Specialized workers in agencies are often taking up some of the workload for other specializations (e.g. intake workers also managing child in care files.) Given the range of responses and the fact that several agencies could not respond to this question due to the holistic approach to their work it is not possible to adequately gauge the caseloads across all functions. From the 7 agencies who did respond to the question the data suggests the following:

- Intake workers carry an average of 2 family service files, 2 children in care and 20 investigations
- Family service workers on average carried no family service files, 17 children in care and 10 investigations
- Permanency planning workers on average carried no family service files, 22 children in care and 25 investigations
- Foster home workers carried one investigation, 5 children in care, 20 foster homes and 2 adoption homes.

Caution should be used in basing a formula solely on caseload alone as it is typical for First Nations child and family service agencies social workers to assume duties which would typically be dealt with by specialized divisions within provincial governments. For example, the Directive does not currently fund policy positions for First Nations child and family service agencies so social workers often take that up as a function above and beyond their child welfare duties whereas provincial child welfare workers can rely on policy divisions to do this work. Moreover, the workload involved with managing a case varies according to severity and as the CIS-03 findings noted, First Nations children and families require more service and thus more staff resources.

There is an increasing trend in child protection in Canada toward certification of professional staff and thus a question specific to this issue was included in the survey. One half of agency respondents (50%) indicated that there is a professional certification/registration (i.e. registration with association of social workers) requirement for agency staff, whereas 41.7% said no and 8.3% noted that this question was not applicable. When asked if agencies pay for professional certification and registration the staff require, 50% said yes, 25% said no, 8.3% said 'partially', while 16.7% indicated that this question was not applicable.

In terms of salary and benefits comparability, two thirds (66.7%) of agencies felt their salary and benefits rates were not competitive whereas 25% felt they were and 8.3% stated that this question was not applicable. In terms of staff turnover related to salary and benefits levels, 16.7% of the agencies revealed that in the past three years, they have had staff leave to join another child welfare organization where the primary reason for their transfer was to get better benefits and salaries yet 83.3% indicated that this had not occurred. Turnover rates are generally low between 1-10% over three years and the primary reasons staff leave the agency are work related stress (related to doing the job but not to workplace safety and morale) (63.6%) and personal and family stress (36.4%) followed by moving to get better salary and benefits (27%.)

Overall, the vast majority of agencies (83.3%) felt that the current formula did not provide adequate funds for human resources costs. This is obviously an area for more focused review in the development of the new formula and will need to be considered in regards to annual costs of living adjustment considerations within the new formula as well.

I. Standards and Cultural Appropriateness

One of the key reasons for developing First Nations child and family service agencies was so that First Nations children and families could receive culturally based child and family services.

The development of culturally based standards and policies for agency operations is a key element in the delivery of culturally based services yet there is no funding in the current formula to support policy development. This section of the questionnaire asked agencies about their ability to develop culturally based services and programs.

The agencies involved in the survey were asked if the funds provided in the formula were adequate to ensure culturally appropriate services. An alarming 83.4% responded no with a further 8.3% responding yes and the remainder indicated that this question was not applicable.

Amongst those agencies who have developed their own standards, 33.3% of the agencies were required to get approval from the province; 25% required partial approval and 25% said no – the remaining 16.7% of agencies did not respond.

Consistent with recommendation number one of the NPR indicating that the future funding formula should be responsive to tribal legislation and governance, survey responses indicate that 41.7% of the agencies were developing their own child welfare laws while 50% replied no, and 8.3% maintained that this question was not applicable.

In terms of community development planning, 58.3% of agencies indicated that the First Nation communities they serve have developed a community development plan that integrates responses to child maltreatment, whereas 25% answered no and 16.7% indicated that this question was not applicable.

Survey responses indicate a clear and critical need for upgrading funding to support culturally based standards and practice in First Nations child and family service agencies. Moreover, the fact that 41.7% of agencies in the sample are in the process of developing their own child welfare laws indicates a need to seriously consider implementing recommendation one of the NPR to expand the range of fundable child welfare authority beyond provincial delegation.

J. Jurisdictional Issues

First Nations child and family service agencies have long reported that jurisdictional disputes between government departments and levels of government (provincial/federal) have resulted in children unnecessarily being denied services or experiencing delays in service. Moreover, agencies indicated that resolving these disputes was taking an inordinate amount of staff time. This section of the survey explored the nature of these disputes, the incidence of the disputes and the time required by agency staff to resolve the disputes.

Survey responses from the 12 agencies indicated that they experienced a staggering **393 jurisdictional disputes this past year** requiring an average of **54.25 person hours to resolve each incident** or 21,320 person hours each year. If this is typical then agencies across the country are dedicating over 200,000 person hours per year resolving these disputes – and this does not include the time of government officials. **If one assumes an average salary of 45K per annum – then jurisdictional disputes cost agencies, and by extension INAC close to five million dollars per year.** The most frequent types of disputes were between federal government departments (36%), between two provincial departments (27%) and between federal and provincial governments (14%). Examples of the most problematic disputes were with regard to children with complex medical and educational needs, reimbursement of maintenance, and the lack of recognition of First Nations jurisdiction. There were variations in the responses with some regions reporting a higher number of incidents than others which may reflect the uneven development of dispute resolution mechanisms. Although tripartite tables have been established in some regions with INAC, the province and First Nations child and family service agencies, the efficacy and authority of these tables to resolve jurisdictional disputes is unclear and inconsistent. Moreover, as some jurisdictional disputes involve federal, provincial or tribal authorities outside of these core participants, it is critical that mechanisms for engaging these groups are integrated into a dispute resolution process. Additionally, dispute resolution mechanisms must be reflective of cultural values and processes of the

participating First Nation child and family service agency.

K. Negotiation of Agreements with the Provinces and Federal Government

Directive 20-1 requires agencies to operate pursuant to provincial legislation and thus agreements must be negotiated between the First Nations child and family service agency and the province to enable the agency social workers to carry out duties pursuant to the child welfare statute. In addition to delegation agreements, agencies must also negotiate funding arrangements with the federal government in order to receive funding for on reserve services. This section describes how these negotiations impact on FNCFSA.

Directive 20-1 allows for the negotiation of tripartite agreements (the province, INAC and the First Nation, Tribal Council or non profit FNCFSA) or complementary bilateral negotiations (agency negotiates one agreement with the province and another with INAC.) Survey results suggested that seven agencies in this sample were using multi-year tripartite agreements. Three others operated under a community and provincial delegation model and one other had delegated authority pursuant to a specific piece of legislation. The most typical period for renewals of these arrangements was within the 1-5 year time frame.

There was wide variation in the amount of legal costs agencies reported as being linked to negotiation of delegation agreements. Three agencies noting that no legal expenses were incurred, three others did not answer the question, 4 estimated their costs to be between $20,000 and $40,000 and one agency reported spending in excess of $300,000 on delegation arrangements. This is likely a reflection of the wide variety of delegation processes throughout the country with some provinces having more detailed and prolonged processes for delegation.

In terms of the provinces, the survey asked agencies if the province provides any financial assistance to the agency for the purposes of reaching a delegation agreement, or renewing a delegation agreement. 91.7% of agencies received no funding from the province to negotiate these agreements with 8.3% indicating that this was not applicable.

Agencies had a variety of suggestions on how to make the delegation negotiation and funding agreement negotiation processes more efficient. To follow is a sample of the recommendations:

1) Greater time to discuss and negotiate (two respondents indicated having received the agreement with only days to review it and sign or have their funding allotment delayed.)
2) Ensure consistency of people at the table
3) Governments should fund the negotiations
4) Government should not dictate criteria to the community
5) Governments should honour their responsibilities
6) Bilateral agreements are needed.

Once negotiated, agencies indicated a wide variation in the amount of staff time needed to maintain the delegation agreements. Six respondents indicated that it took 1-10 days; and there was one agency for each of the following levels 11-20 days; 81-90 days and 141-150 days. For agencies where delegation arrangements take a significant amount of time, the fact that they receive no reimbursement from the provinces to maintain these agreements results in a significant tax on limited resources

Agencies were also asked if their staff provided consultation services to the province and whether or not these were reimbursed by the province. 8 agencies in the sample indicated that they do provide consultation services to the province. Of these 8 agencies, 6 estimated the number of staff days per year to be up to 50 days per annum with the other two estimating 201-250 days per year. In none of the cases did the province provide a fee for service to compensate the agency for its personnel costs or expertise and only 4 respondents indicated that they received compensation for travel costs associated with the consultation.

The survey inquired about agency agreements

and consultation services with INAC.

The most frequent period for renewal of funding arrangements with INAC was one year (6 agencies) with two others reporting renewal periods of 1-5 years, another was on a flexible funding arrangement and one respondent indicated the question was not applicable.

Similar to results with the provinces, agencies report wide variation on the amount of staff time taken to negotiate and maintain these agreements from minimal (3 agencies), 1-5 days (4 agencies), 20 days (2 agencies), 30 days (1) agency and 165-200 days (1 agency.) Moreover, some agencies who reported minimal negotiation times indicated that this was due to a "take it or leave it" approach used by INAC – in that the funding agreements were not in practice negotiable. Legal costs associated with the negotiation of funding agreements with INAC varied with 3 agencies reporting no costs, 2 indicating costs ranged between $1-$1000;1 respondent indicated costs of $30,000 and one agency at $100,000; two other agencies noted this was not applicable.

Survey responses indicate that the federal government, like their provincial counterparts, benefit from consultation services provided by agencies. Of the agencies in the sample, four agencies had provided consultation to INAC. In terms of staff time, two agencies indicated that 5-15 days per year were dedicated to INAC consultation services; one agency reported 16-25 days and the other did not specify. Like the provinces, INAC does not provide any compensation for human resource time provided and provided travel costs in 50% of the circumstances.

L. Other Sources of Agency Financial Support

Mainstream child welfare organizations draw upon services and funding provided by the voluntary sector and other government bodies. This section of the survey is intended to identify the degree to which FNCFSA receive financial support or gifts in kind from First Nations or other sources (i.e.: voluntary sector funders).

The agencies were asked to indicate if their agency receives any services from the band council or tribal council as gifts in kind (e.g.: bookkeeping services, funding for prevention services). 16.7% of the agencies responded yes, 75% of the agencies responded no, while 8.3% stated that this question was not applicable. Of those responding yes, one agency received 25,000 for agency staff and another 100,000 for legal costs from their band or tribal council.

41.7% of agencies indicated that they received funding from sources other than INAC, the First Nation or Tribal Council, yet 50% of the agencies responded no and 8.3% indicated that this question was not applicable. Two agencies had received funds from the Aboriginal Healing Foundation, another from a community foundation, one from the province, one from a federal government department (not INAC) and one unspecified source. Funding allotments ranged from $50 to $250,000.

The limited number of agencies accessing external funding sources may be due to the fact that one third of those surveyed (33.3%) indicated that there were barriers to their applying for provincial or voluntary sector grants while 25% indicated that this question was not applicable. Specifically, 33.3% of agencies in the sample indicated that the key barrier to accessing outside funding was the stacking provision contained in INAC funding arrangements.

As noted in a study conducted by FNCFCS in 2003, voluntary sector supports for children and families are virtually non-existent on reserves and thus agencies must do more than what would be required of a mainstream agency which can refer families to local voluntary sector supports (Nadjiwan and Blackstock, 2003.)

Conclusions

Overall, First Nations child and family service agencies report that current funding levels are inadequate in the following areas: prevention services (including least disruptive measures), human resources, capital costs, standards/ evaluation, culturally appropriate services, records

management and information technology. Human resources funding was identified as a critical need to support current operations and the anticipated expansion of prevention services in the new formula. Two thirds of agencies in the sample feel there are inadequate funds to pay staff equitable salary and benefits packages.

Jurisdictional disputes are a key problem and need to be resolved in order to ensure that Status Indian children on reserve do not face discriminatory allocation of services. In addition, there is likely to be substantial savings in human resources costs should a meaningful dispute resolution mechanism be put in place instead of the current case by case approach that too often places the needs of the child second while governments scramble to see who will pay for the service. Adoption of Jordan's principle where the needs of the child come first in the resolution of all jurisdictional disputes is very strongly recommended.

There is a trend toward FNCFSA developing their own legislation to ensure culturally based services. This suggests that the new generation funding formula should allow for both tribal based and provincially delegated child welfare legislation. In the meantime, delegation and funding agreement negotiations need to be standardized to create efficiencies in negotiations whilst still allowing for adaptation to reflect community specific needs. First Nations child and family service agencies indicated that there should be a move away from the "take it or leave it" negotiation approach by some provinces and in some situations, by INAC.

FNCFSA provide significant gifts in kind to both the provincial and federal governments in terms of consultation services. Although both governments appear to value this input neither is prepared to pay for it – meaning that this service is an additional drain on agencies.

Although some agencies were receiving additional funding from other sources, there is clearly a need to clarify the application of the stacking provision in INAC funding agreements with agencies in order to ensure that they can benefit from voluntary sector funding sources and other types of government funding to enhance the range of services provided outside of INAC funding.

8. PROVINCIAL CHILD and FAMILY SURVEY RESULTS

Regional researchers contacted the following provinces to request that they complete a comprehensive survey designed to identify the range of child welfare services provided, number of First Nations children and families serviced, nature of the funding formula in use in each region, including adjustments for remoteness, capital costs and extraordinary costs:

- British Columbia
- Alberta
- Saskatchewan
- Manitoba
- Quebec
- Nova Scotia
- New Brunswick

Two provinces completed the full survey, with an additional three provinces partially completing the survey. The remaining provinces either chose not to participate or were only able/ willing to provide a very limited amount of information. The low response rate coupled with the inconsistency in questions answered between provinces makes it very difficult to determine with any reliability the range of services typically offered by the provinces or the costing formulas to support such works. However, information provided by the provinces on the numbers of children in care and their funding methodologies is very valuable. Consistent with our approach with the First Nations child and family service agencies, provincial information is presented in aggregate form only to respect the confidentiality of each informant.

Findings

The range of services provided by respondents was linked to provincial statute and legislation in each area – no province as able to provide specific descriptions of the range of services or the costs of

said services. One province noted that the budget is allocated provincially to regions which then have some discretion on how to allocate the budget based on community needs.

Consistent with the findings in the Canadian Incidence Study on Reported Child Abuse and Neglect, the provinces that completed the survey reported disproportionate numbers of Aboriginal children in care. Unfortunately there was wide variation in the degree to which provinces recorded information regarding Aboriginal children and their families. Some regions could only approximate a percentage; others could report numbers of children in care of the province and not of First Nations agencies. However, there were three provinces that maintained excellent data records on Aboriginal children and disaggregated that data by First Nations status. To follow is a summary of the numbers of children in care as reported by these three jurisdictions:

As Table 7 demonstrates, Aboriginal children are over-represented amongst children in care from a low of 350% in Province C to highs of approximately 600% in Provinces A and B.

As indicated in Table 8, overall, the data from these three sample provinces indicates that First Nations children are vastly over-represented amongst both children in care and Aboriginal children in care. Table 7 also provides some indication as to what this over-representation looks like as compared to non Aboriginal children in Canada. Table 8 shows the differences in child in care numbers for First Nations, Metis and Inuit children whilst indicating the percentage of the population that these three groups represent. Pay particular attention to the difference between the cultural groups by child population as compared to the percentage of children in care for the provinces.

Statistics Canada (2001) data indicates that status First Nations children under 14 years compose 6.2% of the overall child population in the 3 sample provinces while Métis and other children representing 3.1% and 90.6% of the child population respectively. As shown in Table 9, when it comes to children in care, the proportion of Status First Nations and Metis in child welfare care compared to other Canadian children, the figures are astounding. **10.23% of all First Nations Status Indian children in these three provinces are in child welfare care as compared to 3.31% for Métis children and less than one percent of other children (0.67%).** This means that approximately one in ten Status Indian children in these three provinces was in care as of May 2005. Considering that a portion of these children in care are likely to transition out of care at some point, **it would not be unrealistic to estimate that about 20% of Status First Nations children will have been in child welfare care at some point of their childhoods.** This staggering statistic affirms First Nations community reports of mass removals of children. This finding also suggests that pan Aboriginal policy and practice

Table 7: Proportion of Aboriginal and non Aboriginal Children in Care in Three Sample Provinces contrasted with population of Aboriginal children

Cultural Identity/Status	Province A		Province B		Province C	
Aboriginal CIC	4,197	52%	4,379	48%	4,803	83%
Non Aboriginal CIC	3,751	48%	4,715	52%	979	17%
Aboriginal Children as percentage of total child population*	8.7%		7.3%		23.1%	

* Statistics Canada (2001) Aboriginal children 0-14 as a percentage of total child population by province

Table 8: Children in Care by Aboriginal Status in Three Sample Provinces

Aboriginal Identity of Child	Province A		Province B		Province C		Total	
Métis	492	11.7%	622	14.2%	510	10.6%	1,624	12.1%
Inuit	26	0.6%	22	.5%	9	.2%	57	.4%
First Nations (status)	3,317	79%	2,592*	59.2%	4,022	83.7%	9,931	74.2%
First Nations (non status)	362	8.6%	1143	26.1%	262	5.5%	1,767	13.2%
TOTAL	4,197		4,379		4,803		13,379	

*includes children who registered and are eligible to be registered with applications pending

Table 9: Percentage of Children in Care by Cultural Group in Three Sample Provinces

Cultural Group	Population of Specific Cultural Group in 3 Sample Provinces*	Percentage of overall Child Population in 3 Sample Provinces	Number of Children in Care (3 Provinces)	Percentage of Children in Child Welfare care by Cultural Group in 3 Sample Provinces***
First Nations Status children	97,065	6.2%	9931	10.23%
Métis children	49,040	3.1%	1624	3.31%
Other children**	1,411,280	90.6%	9445	0.67%

*note that child population data represents children 0-14 years in Canada in the 2001 census. Statistics Canada data indicated that the overall child population (0-14 years in all three provinces was 1,557,385 in the 2001 census)

**note that population of other children includes non status First Nations, Inuit and non Aboriginal children

***note that the proportion of Status Indian children in child welfare care by provinces A, B and C are Province A (11.06%), Province B (8.34%) and Province C (11.1%)

approaches may not be advised given the disproportionate representation of status First Nations children in child welfare care and calls for an enhanced investment in services to Status Indian children.

In terms of funding formulas, two provinces provided details regarding their funding formulas – one in very specific terms and another provided a less detailed formula. The remaining provinces reported that the details regarding the original funding formula for provincial child welfare had been lost over time and was now simply adjusted on an annual basis according to price, volume or changes in circumstances. Several of the respondents indicated that although they operate under a fixed amount of funding they have the option to appeal to the provincial treasury for additional funds in cases of extraordinary circumstances including significant organizational or practice change.

Three provinces report basing human resource needs on caseload or workload models. One province uses a complicated workload formula involving over 1700 pieces of data which has a built in adjustment for changes in social work practice. This model has been in place since 1997 and is subject to a union collective agreement. This particular province did not comment on whether its salary ranges are similar or different from FNCFSA in the area. Another province using a caseload model, noted that when it reimburses agencies for services it assumes funding for one worker for every 7228 days of care provided by the agency – no funding is provided for community services, or executive core funding and only partial reimbursement is provided for protection services. The third province used a caseload model funding one social worker for every 20 cases and noted that the FNCFSA match the salary levels provided by the province. The other regions were unable to respond to this question.

Conclusions

Despite the limited response rate, the provincial surveys revealed some important data:

1) First Nations children are over-represented in child welfare care and compose the largest group within the Aboriginal category. Data from three provinces indicates that First Nations Status Indian children are over 15 times more likely to be placed in child welfare care than other children in the provinces.
2) Ranges of services are based on provincial legislation, regulations and standards, but no province was able to specifically identify the range of services they provide, noting in at least one case, that this was due to the flexibility given to regions to allocate funding based on community need.
3) Caseload or workload appears to be the most significant variable in shaping provincial human resource needs.
4) The good example set by the three provinces in the sample that collect information on Aboriginal children disaggregated by cultural group should be made uniform throughout all provinces. Collecting disaggregated data allows for a more targeted understanding and response to the needs of Aboriginal children from diverse cultures and contexts.

Further analysis of provincial funding formulas where they exist will occur in Phase Three of the research program.

9. REMOTENESS FACTOR

The National Policy Review (MacDonald & Ladd, 2000) found that the remoteness factor in Directive 20-1 required review in order to ensure it adequately reflected the additional costs to child and family service agencies related to remoteness. In addition to the analysis of remoteness questions in the First Nations child and family service agency survey, Dr. John Loxley analyzed the current remoteness factor and compared it with two other formulas (one used by a provincial government and the other by a corporation.)

Findings

The current remoteness factor classifies agencies in accordance with their distance from the service centre, degrees latitude, and year round road access. It contains three separate adjustments– one on the per band amount, one on the per child

amount and another on the per agency amount. These adjustments vary and no documented rationale exists to support the varying amounts. So changing the adjustment factors may correct the concern by remote agencies that the current formula is inadequate to meet costs. However it is unclear whether this type of adjustment would address the primary concern expressed by remote agencies which was that the current service centre used to calculate the remoteness factor for the agencies does not necessarily reflect the place where agencies go to access the specialized range of services and products related to child welfare.

A more promising option is to run analysis of the current remoteness factor replacing the current service centres with the city centres used to calculate remoteness for other INAC programs. Preliminary analysis of the city centers indicates that these locations seem to correlate more closely with the locations from which agencies are likely to access their services and products.

The current remoteness factor formula was compared to two other remoteness factors – one used by a province and another by a corporation. In each case the remoteness formula was applied to First Nations child and family services in the province were these two formulas were derived. Neither formula proved to be an improvement over the current remoteness factor as they were not designed with the unique needs and economies of scale of First Nations child and family service agencies in mind.

Conclusions

Replacing the service centre used in the current formula with the city centre used for some other INAC programs appears to be the most promising resolution to ensure First Nations child and family service agencies operating in remote area have adequate funding. Further analysis of this option will be conducted in Phase 3 of the research program. Importantly a question asking agencies to identify the centre where they go to access specialized child welfare services and products will be included and these results will be compared to the service centers and city centers identified in the INAC remoteness factor

10. How Much has INAC's Failure to Adjust the Operating Formula for Inflation COST FIRST NATIONS CHILD AND FAMILY AGENCIES?

Although Directive 20-1 does contain a cost of living adjustment it has not been implemented since 1995. This is considered by many to be a major weakness in the formula, one which leads to both under-funding of services and to distortion in the services funded since some expenses subject to inflation must be covered, while others may be more optional. How much has this failure to adjust for inflation cost First Nations Agencies since the last adjustment in 1995?

Table 10 shows that the Consumer Price Index, the most widely accepted indicator of cost of living increases, rose from 104.2 in 1995 to 126.3 in 2005 (May). If the starting point in 1995 is expressed as 100, then the index in 2005 rises to 121.21, i.e. prices increased by 21.21% over this ten year period, when no adjustments were made for inflation by INAC.

Table 10: Increases in the Consumer Price Index (1995-2005)

CPI	Year	CPI set at 100
104.20	1995	100.00
105.90	1996	101.63
107.60	1997	103.26
108.60	1998	104.22
110.50	1999	106.05
112.50	2000	107.97
116.40	2001	111.71
119.00	2002	114.20
122.30	2003	117.37
124.60	2004	119.58
126.30	2005	121.21

Source: Statistics Canada

We know, therefore, that had cost of living

Table 11: Inflation Adjustments by Region (1999-2005)

INAC Region	Formula Funding	Adjusted for Inflation	Difference
British Columbia	$80,992,151	$92,059,053	$11,516,902
Alberta	$144,061,110	$164,650,535	$20,589,425
Saskatchewan	$151,445,637	$173,138152	$21,692,514
Manitoba	$191,591,040	$218,703,956	$27,112,916
Ontario	$123,427,998	$140,728,620	$17,300,623
Quebec	$59,956,671	$65,154,656	$8,197,985
Atlantic	$39,705,067	$45,312, 751	$5,607,684

adjustments been made annually since 1995, then funding would have been higher in 2005 than in 1995 by 21.21% purely on account of inflation, i.e., ignoring any increase in the number of children, number of agencies etcetera. Although we do not, have access to data for funding levels in 1995.

We do have data for 1999 to 2005. If we adjust the funding data for each year by the cost of living index in Table 10, we can calculate what funding would have been available over this six year period had inflation protection been available in each region (please see Appendix 2 for tabulation per year in each region). Table 11 shows what this would have been for each INAC region from 1999 to 2005 and the difference between this and actual funding, representing lost revenues from INAC for operations.

Table 12 shows what that total would have been the national operations funding with inflation adjustment and what the difference is in total for all regions. It shows that **between 1999 and 2005, cumulative operations funding would have been larger by $112 million, at $900 million instead of the $788 million which was provided in actuality.**

This represents a loss of 14% of funds over the period. For the year 2005, operations funding would have been $142 million instead of $117 million, or $24.8 million higher than funding actually provided. This amount is roughly the additional monies the government has promised to make available to First Nations Agencies this year, one time only!! To fully compensate for inflation losses over this period, this $25 million, and more, would need to be made available every year from now on. This helps to situate the additional money in the broader context of historical under funding.

11. SMALL AGENCIES

Small agencies (those serving child populations of less than 1,000) represent 55% of the total number of First Nations child and family service agencies in Canada, excluding the province of Ontario. It is critical to understand the needs and challenges of these agencies in order to promote optimal support and functioning.

Study Design and Methodology

The objective of this study is to describe the challenges faced by small agencies and ensure the needs of these organizations are considered in the development of an alternative funding formula for First Nations child and family service agencies.

The data for this study was gathered using a structured interview conducted with fourteen executive directors of small First Nations child and family service agencies. Information was gathered using a standardized questionairre and was administered either on site or by telephone.

Table 12: Losses on INAC Operations Funding Due to Lack of Inflation Adjustment (All INAC Regions)

Year	Formula Funding	Adjusted for Inflation	Difference
1999	$105,053,015	$111,404,589	$6,351,574
2000	$108,573,428	$117,221791	$8,648,363
2001	$110,959,054	$123,950,421	$12,991,367
2002	$113,702,424	$129,852,097	$16,149,673
2003	$114,848,709	$134,798,437	$19,949,728
2004	$117,895,263	$140,976,486	$23,081,222
2005	$117,147,781	$141,993,903	$24,846,122
Total	$788,179,674	$900,197,723	$24,846,122

Agencies were selected from the provinces of British Columbia and New Brunswick due to the high distribution of small agencies in these regions. Quebec, the only other region with a significant number of such agencies was not included due to resource limitations. The primary areas of inquiry for this report are:

1. **What are the core administrative staffing and related requirements of small agencies?**
2. **How should the funding formula be adjusted to meet these requirements?**
3. **What is the minimum size of agency and related population consistent with good social work practice and economies of scale?**

It is important to note that maintenance in British Columbia is not reimbursed at actual costs but rather on the basis of an "average actual cost" that is set by the province each year for foster and group care. This amount may exceed the actual costs for maintenance for some children in First Nations child and family service agency care and in these instances, the INAC region has allowed agencies to keep the maintenance surplus and apply it against expense shortfalls under the operations formula. This has worked to the benefit of First Nations agencies in British Columbia as most of the agencies in that province are small agencies and thus do not receive the full operations allotment.

Summary of Findings

In addition to child protective services, provided by fully mandated agencies, the agencies in the study provide a diverse range of services which include, but are not limited to, family and child supportive services, foster care, family reunification, prevention and community development. There are, however, a number of services which agencies indicated they would like to provide but are unable to due to limitations of the current funding formula. Virtually all respondents stated that in order to provide the full range of services needed by the community, additional full time staff would be needed. The most commonly identified staffing need was for social workers and prevention workers.

The findings indicate that small agencies face a number of challenges in the areas of core administrative and staffing related requirements with 75% of respondents indicating that their salary and benefit levels are not comparable to other child welfare organizations.

The most frequently cited non-staffing cost that would be incurred if agencies provided their preferred range of services is associated with capital costs for office buildings, space or renovations. New Brunswick agencies placed equal priority on costs for information technology software and hardware. **There is a substantial gap, with an average differential of $320,000, between the funds required to run an agency with the preferred full range of services and the amount of funds agencies currently receive.**

To optimize services, most agencies share resources with other reserve based programs. Examples include joint funding of staff positions, cosponsoring training or community events and sharing costs to bring in specialized services. Due to the high level of needs in their communities, none of the respondents stated that there should be a minimum population size to ensure good social work and economies of scale.

The pressure on First Nations child and family services to deliver services comparable to the provincial government child welfare agencies is a challenge for small agencies. In regards to cost-effectiveness, participants were unanimous in the position that their services were more cost-effective as compared to provincial counterparts due to the broader scope and extensive nature of the services provided. Cost differences are also due to lower maintenance costs and non-unionization. The demands on staff in small agencies are high with virtually all respondents agreeing that staff members perform duties not expected by employees in larger agencies.

In order to meet some the challenges small agencies face in providing a full range of services, the option of centralizing some agency functions was explored. While this was a favored approach by most agencies, notably all New Brunswick participants, it was not accepted by all due to issues regarding geographic isolation and/or high travel costs.

Directive 20-1, the use of surplus funds and alternatives for maintenance funding formed the basis of inquiry regarding alternative funding approaches. The majority of respondents believed that an entirely new formula was required incorporating prevention and out of care options, an increased rate for remoteness, a mechanism for block funding and consideration of the total population - whether status or non status.

The population policy threshold in Directive 20-1 was considered to be an inadequate means of benchmarking operations funding levels by all participants in the study. Approximately half of the respondents stated that funding should be based on community needs not child population counts. Another 25% of participants stated that population counts should reflect the entire population, not just children as it is the entire family which needs support when a child is unsafe or at risk in the home.

Policy directing the use of surplus funds differs by region and accounts for the variances in agency possession and use of these funds. Surplus funding was reported by British Columbia agencies only due to their maintenance per diem arrangement. While agencies in New Brunswick must return surplus funds, British Columbia agencies are able to use these funds for child and family services.

British Columbia is unique in using the per diem arrangement to pay for maintenance costs. In terms of the allocation of funding for maintenance based on actual costs or by per diem, all New Brunswick agencies expressed preference for payments based on actual costs, while most British Columbia agencies preferred the per diem arrangement. The positions expressed by both regions appear to be motivated by fear. New Brunswick agencies feared per diem arrangements would result in a budget deficit or reduced service delivery while British Columbia agencies feared that removing the per diem arrangement and associated surpluses would mean reduced funds for staff and prevention programs.

Conclusions

While small agencies remain viable and cost-effective resources, they face significant challenges in terms of administrative and core staffing requirements. The average cost actual system in BC has appeared to have partially compensated for the

low operational funding. Cuts or changes to this funding arrangement would likely substantially decrease the ability of these agencies to provide the current range of services.

There is a substantial disparity in salary and benefit levels as compared to other child welfare organizations as well as a significant gap in what is required to run an agency with the preferred full range of services and what agencies currently receive. Although agencies had different perspectives on the used of surplus funds and maintenance funding alternatives, dissatisfaction with the current Directive 20-1 population threshold policy was unanimous.

Recommendations for alternative funding approaches include:

1. Funding for prevention and out of care options
2. An increased rate of funding for remoteness
3. Development of a mechanism for block funding
4. Consideration of the total population, whether status or non-status.

Similar to their larger counterparts, small agencies maintain a holistic approach to child and family welfare which includes an emphasis on prevention and community development. These are proactive services which function to reduce the incidence of child abuse over time. Small agencies do face some unique challenges and as these agencies constitute the majority of First Nations child and family services in operation, it is evident that more focused study is required.

LIMITATIONS OF THE RESEARCH

In every research project there are important limitations and this is true of the works undertaken for this Phase Two project. Overall, we are very pleased with the quantity and quality of the data but it is important to acknowledge the limitations in the research and analysis. This phase of the project had to be completed in its entirety in less than five months and thus, time was definitely a factor which limited our ability to collect and validate data. This was particularly true for the provincial surveys. Although all provinces were contacted for the research (except Ontario, PEI and Newfoundland) the researchers did not always have the time needed to negotiate consent to participate and collect the data within the defined time frame. We, and the individual researchers, have made every effort to identify limitations in the research whenever possible.

As noted before, this research does not include Ontario (as it is funded under a separate funding arrangement), nor has it specifically focused on foster care costs or the proposed block funding methodology. Dr. Brad McKenzie (2002) prepared a report to inform block funding and cautions that this approach, whilst having benefits of increased flexibility, is not appropriate for all First Nations child and family service agencies (i.e. small agencies, new agencies, agencies lacking a long term track record that allows for accurate prediction of future costs (thus setting a reasonable base amount for the block.)

An additional limitation is that given the short time frames for the research to be completed, there is an incomplete analysis of the costs related to children in care and it strongly recommended that future research be undertaken to define the range of services provided to children and care and the relative costs thereof.

We have also not accounted for unpredictable changes INAC may make to current funding levels or arrangements. We would hope that any such changes would be put in abeyance until adequate analysis of how these proposed changes would interface with any new formula were fully considered in partnership with First Nations.

IMPLICATIONS FOR THE THREE FUNDING FORMULA OPTIONS

Redesigning Directive 20-1

Overview of Directive 20-1

The current funding formula was designed in 1989 in an effort to standardize funding levels

amongst First Nations child and family service agencies in Canada and promote their further development. The Directive requires that agencies follow the provincial child welfare legislation in each province but includes no adjustment for the content of said statutes. It includes a guiding principle that services should be comparable to those provided to children in similar circumstances off reserve. but contains no mechanisms to ensure this is achieved.

In addition to a calculation for remoteness, Directive 20-1 provides funding pursuant to two broad categories of funding:

1. **Operations**: Based on the Status Indian child population resident on reserve this pot of funds is intended to support the administrative functioning of the agency and includes a small amount for prevention services and legal fees.
2. **Maintenance:** Provided on a reimbursement basis for placing Status Indian children resident on reserve into out of home care.

The Directive also includes an allotment for a cost of living adjustment although this has not been implemented since 1995. Additionally, the Directive included funds for agencies to conduct evaluations at years three and six of operations but as the Auditor General of Canada (December, 2002) has noted First Nations child and family service agencies consider evaluation as a key management tool to inform best practices and would like to see ongoing funding for evaluation.

Although it is broadly acknowledged that the Directive achieved the goal of increasing the numbers of First Nations child and family service agencies in Canada, there were significant concerns being expressed by First Nations child welfare agencies about insufficient levels and flexibility in funding arrangements – particularly with regard to providing primary, secondary and tertiary prevention services.

In response to these concerns, the Assembly of First Nations and the Department of Indian Affairs and Northern Development undertook a review of the Directive in partnership with a panel of First Nations child and family service agency staff and departmental officials. The resulting report, the Joint National Policy Review on First Nations Child and Family Services (MacDonald & Ladd, 2000) contained seventeen recommendations for change. As more than four years had passed between the time of that report and the commencement of this research project, the research team checked the validity of the NPR recommendations in Phase One and found that participating First Nations child and family service agencies continued to believe the recommendations were valid and had application in a 2005 context.

Implications of Research Findings for Directive 20-1 Option

Based on the research findings **the Directive would need substantial alteration in order to meet the requirements of First Nations child and family services and ensure equitable child welfare services for First Nations children resident on reserve.** From the outset, ongoing separate pools of funding outside of the current operations and maintenance budgets are being recommended for inclusion in the new formula to cover the following expenses:

1) Community Development (primary prevention)
2) Least Disruptive Measures
3) MIS system maintenance and training
4) Standards and evaluation funding
5) Exceptional circumstances funding pool (2 million dollars as a minimum value to be adjusted annually) to be held nationally.

Additionally separate funding is recommended for one time or exceptional expenses:

1) Community assessments relating to extraordinary circumstances
2) Capital costs to bring MIS systems up to minimum standards and to develop national and regional data collection frameworks to inform policy and practice.
3) Capital costs for the development of culturally based standards.
4) Capital costs to allow for accessibility of offices for disabled persons.
5) Capital cost to allow for adequate office space

for agency operations and to ensure that office space meets building code standards.

6) Funds for research and development at a national, regional and agency level.

7) Funds to adjust funding when changes in provincial legislation are introduced.

In addition to these costs, we recommend the reintroduction of the cost of living adjustment. **The failure to implement the cost of living provision in the current formula has resulted in a 112 million dollar loss of funding in the national operations budgets for the years 1999-2005**. This means that the 24.8 million dollars is needed to meet the cost of living requirements for 2005 alone, if the loss of purchasing power since 1995 is to be restored.

Adjustments to the remoteness factor are required so that it better reflects the costs associated with child welfare and providing adequate funds for staff salary and benefits are required.

Importantly, the research recommends the adoption of Jordan's Principle. In circumstances where a service would normally be available to non Aboriginal children, the provincial or federal government department which first receives a request to pay for services for a First Nations child should fund the service without delay or disruption. The government of first pay then has the option of referring the payment to a jurisdictional dispute table for review. Consistent with the Convention on the Rights of the Child Jordan's principle would ensure that child's needs come before the needs of governments – all the time.

It is also clear that **a number of agencies are moving toward the development and implementation of their own child welfare laws and thus the implementation of recommendation one of the NPR which encourages that the new funding policy support First Nations based jurisdiction and governance** is becoming increasingly important. This would simply mean expanding the eligibility range for jurisdiction to include First Nations child welfare legislation.

Recommendations

That the research team move forward with a full survey of First Nations child and family service agencies in order to quantify the implications of these modifications to the funding formula for both First Nations agencies and INAC. This will be accomplished through the development, implementation and analysis of results of a survey to be administered to all First Nations child and family service agencies in Canada (except in Ontario where a separate funding agreement exists.) This survey would be informed by the results of Phase Two and will include specific questions on the areas where modifications to the current formula are being considered. It is anticipated that the survey will be administered over the summer of 2005. This timing is not ideal as agency staff often take their vacations during this time, but unfortunately deferring this to the fall is not an option as INAC needs to develop the Memorandum to Cabinet requesting the new funding authority no later than September of 2005.

In addition to this agency survey, specific focused research is recommended in the following areas:

1) Research on the minimum economy of scale for operation of a First Nations child and family service agency.

2) Legal review of tort law relevant to First Nations child and family service agencies to determine a minimal level of liability coverage.

3) Research on the implications of substituting the city centre for the current service centre in the remoteness factor.

4) Obtain population trend data on the status Indian children in care in order to understand how the current definition of eligible child impacts FNCFSA funding over time.

5) Analyze the interface between Directive 20-1 and the funding instruments used by INAC (e.g.: contribution funding agreements.)

Overall, a blending of this option and the First Nations formula appears to be the most promising option emerging from the research. The additional information provided by the universal First Nations child and family service

agency survey and the recommended focused research projects will help better define the practice and economic implications of the proposed modifications to Directive 20-1.

LINKING FNCFSA FUNDING TO PROVINCIAL FUNDING LEVELS

This option involved identifying the funding formulas used by each province and then applying it to the First Nations child and family service agencies in the respective province to see what the implications were. **Although at first glance this option may suggest that there would be "provincial comparability" if the formulas were applied to First Nations child and family service agencies further analysis immediately identifies complications.** From the outset there were several complications regarding this approach: 1) application of provincial formulas could result in no fewer than 10 different funding formulas thereby creating potential for inequities between regions 2) provincial funding formulas are developed with provincial economies of scale and service contexts in mind – application to FNCFSA that serve smaller communities with greater service needs was questionable and 3) provincial child and family service authorities may draw upon the resources of other provincial ministries to support delivery of child welfare (i.e.: for capital building costs, legal costs) – if these services were funded outside of the provincial formula then the formula would need to be adjusted to reflect these costs and 4) provincial funding formulas are developed by provincial staff and have not included First Nations or the federal government thus pursuing this option would mean locating the control of funding strictly within the ambit of the provinces and 5) consistent with the findings of CIS-03, provinces typically serve a population with lower needs for child welfare services than First Nations child and family service agencies.

Despite the initial complications of this approach, the NAC directed that further analysis of this option be conducted in phase three of the research program. The research team had initially hoped to conduct an economic analysis of three provincial funding formulas, but as two of three of the provinces identified for analysis turned out to not know what their formula was, a detailed analysis could only be completed for one province.

Description of Provincial Models

Several provinces interviewed report that they no longer have any record as to what the original structure of the funding formula for child and family service deliver was in their area. They have simply adjusted the amount provided annually by price and volume. This creates an obvious complication as the intent was to apply the provincial formulas to First Nations child and family service agencies in each jurisdiction.

As noted above, the research team had initially planned to identify the funding formulas for three provinces and then apply them to the First Nations child and family service agencies in each province to see what the results would be. However, two of the provinces identified for study did not have any record of how their funding formulas were derived. Therefore, analysis of the implications of the applying a provincial funding formula to First Nations child and family service agencies in that province was only conducted in one region.

This province indicated that their province unilaterally applies a funding formula based on the Universal Cost of a Direct Service Worker. The formula provides a Direct Service Worker for each 7228 days of care provided by the agency. Unlike their provincial agency counterparts:

- The FNCFS Agencies do not receive Services to Community funding.
- The FNCFS Agencies do not receive Executive Core funding.
- The FNCFS Agencies receive partial funding for Protection Services.

When the provincial funding formula was applied to First Nations child and family service agencies in this province the majority of agencies would receive less funding than under the Directive.

Provincial surveys indicate that workload and caseload are primary determinants of human resource needs in at least three provinces. One province uses a complicated workload formula involving over 1700 pieces of data which has a built in adjustment for changes in social work practice. This model has been in place since 1997 and is subject to a union collective agreement. This particular province did not comment on whether its salary ranges are similar or different from FNCFSA in the area. Another province, using a caseload model, noted that when it reimburses agencies for services it assumes funding for one worker for every 7228 days of care provided by the agency – no funding is provided for community services or executive core funding and only partial reimbursement is provided for protection services. The third province used a caseload model funding one social worker for every 20 cases and noted that the FNCFSA match the salary levels provided by the province. The other regions were unable to respond to this question.

Implications of Research Findings for Provincial Funding Level Option

An analysis of this funding option indicates that this is the least promising of all three funding formula options in that even if the funding formulas could be identified for all ten provinces, there is no indication that the formulas were developed to be responsive to the unique service needs or economies of scale for First Nations child and family service agencies.

Moreover, selection of this option would be inconsistent with the recommendations of the National Policy Review which sought to reduce inequities in funding levels between regions – if the provincial option were selected there would be, in effect, ten funding formulas for First Nations child and family services.

Recommendations

1) **Given the short time frame for the analysis of all three formulas and the need to focus on the most promising alternative for the survey of all FNCFSA, we recommend not pursuing the option of applying provincial funding formulas to FNCFSA.**

2) **Analysis of the existing provincial funding formulas should, however, continue to identify possible best practices for integration into the new formula for FNCFSA.**

3) **If possible within the time frame for Phase Three the research team will attempt to identify another provincial funding model and apply it to First Nations child and family service agencies in the region to see what the results would be.**

THE FIRST NATIONS BASED FUNDING MODEL

Description of First Nations Model

There is no preexisting template for this model – it would be an entirely new funding formula which, taking into account the recommendations of the NPR, would respond to the unique needs of First Nations child and family service agencies. **In principle, this approach would be the most community based and reflect the findings of the research conducted by Cornell and Kalt (2002) which indicated that community based decision making accompanied by adequate resources creates optimal conditions for sustained socio-economic improvements.** It would involve comprehensively researching the needs of children and families serviced by the diversity of First Nations agencies and then, with the involvement of the FNCFSA, develop a funding model that best equips them with the tools needed to support families in their communities taking into full account the current status and evolution of child welfare legislation, standards and best practice (provincial and First Nations) Integration of outcomes and evaluation mechanisms would be key as agencies measure the efficacy of various approaches to enhancing child safety and well being.

The range of tools available to First Nations agencies would include the ability to draw upon the resources and expertise of neighboring First

Nations agencies to respond to exceptional circumstances such as the admission of large numbers of children in care or a child maltreatment investigation involving a staff member. Regional and national research, policy and networking non government organizations would further support agencies in their regions. The mandates of these organizations would reflect local needs, but may include the design of training programs for staff, development of standards templates, information management systems, and research on key regional basis. Consistent with the NPR the establishment of national NGOs to support FNCFSA through the provision of policy, research and networking functions that may include monitoring the implementation of the Convention on the Rights of the Child respecting First Nations children, conducting national research projects, information sharing on promising practices and linkages to promising practices amongst Indigenous peoples worldwide.

The development of such a model would require having broad based information on the longitudinal experiences of First Nations children and families coming to the attention of child welfare and the range of community based responses currently provided by First Nations child and family service agencies. Once this is determined a costing exercise would need to be designed to be undertaken and a funding formula developed. Unfortunately, much of the baseline data needed to develop a fully First Nations formula is currently unavailable. However, the research conducted for Phase Two did reveal some important findings relevant for the development of this option over time.

Implications of Research Findings for First Nations Model

The Canadian Incidence Study on Reported Child Abuse and Neglect is the first national data set that describes the experiences of First Nations children coming into contact with the child welfare system. Although this study is limited to reported cases of child maltreatment, it has the benefit of running in five year cycles allowing researchers to mark changes over time. The 2003 study, the second cycle of CIS, finds that Aboriginal children continue to be over-represented at every decision making point from reporting to admission into care. It also confirms findings of the 1998 study that First Nations children are by far the largest group of children comprising the Aboriginal sample, accounting for over 67% of all investigations.

The most important finding of 2003 is that it affirms the findings of the 1998 cycle indicating that Aboriginal children are twice as likely to come into contact with child welfare authorities for neglect than their non Aboriginal peers. Physical neglect (failure to provide for a child's basic needs such as clothing, shelter, nutrition) is the most frequent form of neglect experienced by Aboriginal children. This is important as the ability to provide for a child's needs is correlated with income and Aboriginal parents continue to be more likely to rely on financial assistance or part time employment than their non Aboriginal counterparts.

The CIS data signals that investments in family support services that account for poverty, poor housing and addictions could maximize the standard of family care and avoid the current over-representation of First Nations children in child welfare care.

An interesting finding is regarding the placement of Aboriginal children in care. **When the child is on reserve they are three times more likely to be placed in the range of extended family and kinship placements than their off reserve counterparts**.

First Nations child and family service experts have routinely advocated that social work approaches in families must balance assessment of risk with the recognition and leveraging of protective factors (strengths) (Foxcroft & Blackstock, 2003; Blackstock, 2003). **As Dr. Helen Jones (2003) notes this approach has been integrated into child protection services in the UK in what is known as the Integrated Children's System (ICS.) This system relies on three inter-related components: 1) an assessment model framework that considers**

the child's developmental needs, the family and environmental factors and parenting capacity 2) developing information requirements and 3) sample formats for producing and generating reports. This system relies heavily on information management because one must have a holistic data management system that can be used for child and family case planning and policy making. The ICS system collects data to inform five over arching goals: healthy children, staying safe, enjoying and achieving, making a positive contribution and economic wellbeing. The data management system was designed to be attuned to social workers motivations for using a system and thus maximized their use of the system. The primary motivating factors for social workers to use the system were better outcomes for the children they served and more efficient use of their time. It also provided ample staff training time and opportunities for feedback into the process. Results of pilots of the ICS system are very encouraging with the following positive outcomes having been reported:

- Better descriptions of children and their families provide a stronger foundation for the development of effective service plans at the family level.
- More comprehensive information allows for more effective targeting, and coordination of resources to meet needs of children.
- Provides a basis for mapping trends of child need and identification of service gaps.

A model such as ICS would have important applications in a First Nations context as it accounts for the structural risk factors identified in the CIS -98 (Trocme, Knoke & Blackstock, 2004) study and puts in play a system that better describes the strengths and risks experienced by children and families allowing for a more effective and efficient use of resources over time. A caution must be raised about importing the ICS model without accounting for the cultural differences in, and between, First Nations but the integration of a holistic and strength based approach holds significant promise.

As Stanley Loo notes, **augmenting information systems would greatly increase reporting efficiencies as recommended by the Auditor General of Canada and would have the added benefit of supporting First Nations child and family service agencies to better identify changes in community needs and measure the efficacy of service outcomes.**

In terms of jurisdiction disputes, the new formula would entrench Jordan's principle of putting the needs of the child first and the resolution of the jurisdictional dispute second. This does not mean that jurisdictional disputes would go unresolved. Ideally, a First Nations funding formula would include an arms length dispute resolutions system that involves relevant stakeholders and, whenever possible, the integration of cultural approaches to resolving disputes.

Additionally, **a separate pool of funds needs to be established to respond to exceptional circumstances and communities in crisis that supports community based solutions and allows for cooperative resource sharing with neighboring First Nations child and family service agencies when necessary.** Consistent with the findings of Irvine (2004) the definition of a community in crisis or an extraordinary circumstance is contingent on the context of the community, available resources, degree of crisis response planning and resources and the precipitating event.

To set a baseline for understanding what is, or is not, extraordinary in each community, Dr. Cradock recommends that a community capacity assessment be completed on each community. This assessment will also identify existing community capacity to respond to exceptional circumstances and identify gaps in capacity. This assessment should account with the following continuum of extraordinary circumstances response as recommended by Irvine (2004):

- Recognize that First Nations child and family service agencies are often the first responders to community crisis and thus need to have equitable funding bases in order to meet the additional demands of crisis situations.
- Building community capacity to respond to crisis situations including the development of

crisis response procedures, protocol agreements and by providing training to First Nations child and family service agency staff.

- Moving to prevention as a mechanism to avoid as many crisis situations as possible – this means further investment in prevention services and the coordination of said services
- Building relationships within the First Nation, with neighboring First Nations child and family service agencies, non profits and levels of government to augment the range of resources available and engage the broadest available skill set in community crisis plan planning, immediate response and after crisis care.

Improving staff salary, benefits and training resources would be an important validation of the skills and expertise of FNCFSA staff would ensure that agencies are able to recruit and maintain qualified staff. It is important to keep in mind that professional development options should include a balance of academic and non academic pursuits allowing staff to upgrade their skills and knowledge. Adequate funding should also be provided to cover off costs related to workplace safety.

Recommendations

Implementation of the following recommendations would significantly advance the development of a First Nations based formula in the future:

1) Implement targeted funding for community development and least disruptive measures and include funds for ongoing evaluation of new programs.
2) Implement funding for adequate culturally based policy and standards development and maintenance that includes ongoing evaluation and maintenance.
3) Ensure that human resources funds are sufficient for FNCFCSA to offer competitive salaries and benefits whilst ensuring workplace safety and professional development (academic and non academic)
4) New treasury board authorities should provide funds for INAC to support national and regional research projects such as the CIS that significantly inform policy and practice for FNCFSA.
5) Increased investment in research to describe promising practices in FNCFSA management, policy and practice whilst identifying the conditions that made the promising practice possible.
6) Implement recommendation one of the National Policy Review by increasing the scope of child welfare authority eligible for funding to include First Nations based legislation.
7) Introduce a financial review and adjustment to account for changes to provincial child welfare legislation.

Conclusion

This report is dedicated to Jordan and to all First Nations children and families. In reading the statistics and the findings it is their images that should guide our interpretation and inspire our action.

This research presented a unique opportunity to bring together a multi-disciplinary team of experts whilst balancing academic and community expertise. To date, research on First Nations child and family services has been limited in Canada despite the over-representation of First Nations children in care and the development of First Nations child and family service agencies. This report represents the most comprehensive overview of First Nations child and family services completed to date. The findings, whilst having their limitations, affirm the calls by First Nations child and family service agencies for greater emphasis on prevention and least disruptive measures services in order to support family well being and over time reduce the numbers of children in child welfare care.

To follow is a highlight of some of the most important findings of this research report:

1) Status First Nations children are drastically over-represented amongst both children in care and Aboriginal children in care. In three sample provinces First Nations children are 15 times more likely than other children to enter

child welfare care. One in ten Status Indian children in these provinces was in care as of May 2005.

2) The most common reason why First Nations children come to the attention of child welfare authorities is neglect.

3) First Nations children are twice as likely as their non Aboriginal peers to have their cases substantiated and to be admitted into child welfare care. Funding levels should reflect the increased costs associated with these increased levels of service

4) The cost of living increment has not been provided to First Nations child and family service agencies since 1995. What this means is that for the time period where we have data (1999-2005) the loss of funds due to inflation for the operations portion of the funding formula was 112 million dollars.

5) Funds for prevention and least disruptive measures are not adequate either in terms of program development, program delivery and evaluation or staffing requirements.

6) First Nations child and family service agencies are having significant success in placing children in culturally based placements.

7) Two thirds of First Nations agencies report that funding for salaries and benefits was not sufficient in the current formula.

8) A large majority (84%) of agencies felt that current funding levels were insufficient to provide for adequate culturally based services.

9) The First Nations child and family service agencies in the sample reported an aggregate of 393 jurisdictional disputes that took an average of 54.25 person hours each to resolve.

10) First Nations child and family service agencies provide significant gift in kind consultation service to the provinces and federal governments.

11) Management information systems vary widely ranging from pen and paper to agency developed systems. In the vast majority of cases MIS systems do not meet minimum standards.

12) There is currently no adjustment to account for changes in provincial legislation resulting in reported gaps in services provided on and off reserve.

The ongoing research will help refine these findings and determine the costs of standing still and going forward with modifications to the funding formula.

In the end the value of this research will be judged by the actions that are taken in its spirit. Knowing what the problems are and knowing what the solutions are is simply not enough. If we do not act courageously and without compromise to ensure that First Nations have as Elder Donald Horne says *"what is rightfully theirs- a chance to live with dignity, in the ways of their ancestors, safely at home."*

May 11, 2005

Introduction

This report presents a comparison of Aboriginal and non-Aboriginal children investigated for maltreatment in Canada in 2003. The analyses are based on the preliminary findings from the ***2003 Canadian Incidence Study of Reported Child Abuse and Neglect*** (***CIS-2003***) (Trocmé, Fallon, et al., to be released in October 2005). Analyses were conducted under contract for the First Nations Child and Family Caring Society to support the Caring Society's review of the Federal Government's child welfare funding framework. The purpose of the analyses was to examine differences in profiles of and service responses to Aboriginal children compared to non-Aboriginal children. The CIS 2003 study was made possible by a grant from the Public Health Agency of Canada.

Methodology

The ***CIS-2003*** is the second nation-wide study to examine the incidence of reported child maltreatment and the characteristics of the children and families investigated by Canadian child welfare services. The estimates presented in this report are primarily based on information collected from child welfare investigators on a representative sample of over 11,000 child welfare investigations conducted across Canada, excluding Quebec.

Specifically, the CIS–2003 is designed to

1. Examine rates of investigated and substantiated physical abuse, sexual abuse, neglect, emotional maltreatment and exposure to domestic violence as well as multiple forms of maltreatment;
2. Examine the severity of maltreatment as measured by forms of maltreatment, duration, and physical and emotional harm;
3. Examine selected determinants of health for investigated children and their families;
4. Monitor short-term investigation outcomes, including substantiation rates, out-of-home placement, use of child welfare court, and criminal prosecution, and
5. Compare 1998 and 2003 rates of substantiated physical abuse, sexual abuse, neglect, emotional maltreatment and exposure to domestic violence; the severity of maltreatment and short-term investigation outcomes

Sample

The ***CIS-2003*** captured information about children and their families as they came into contact with child welfare services over a three-month sampling period. Maltreated children who were not reported to child welfare services, screened-out reports, or new allegations on cases currently open at the time of case selection were not included in the ***CIS-2003***. A multi-stage sampling design was used, first to select a representative sample of child welfare offices across Canada, and then to sample cases within these offices. Information was collected directly from the investigating child welfare workers. The core sample of 11,562 child investigations was used to derive estimates of the annual rates and characteristics of investigated child maltreatment in Canada, outside of Québec[1].

A stratified cluster design was used to select maltreatment investigations for the ***CIS-2003***. Because of variations in the organization of child welfare service systems across Canada, a four-stage sampling process was required to select a nationally representative sample of children investigated because of suspected maltreatment. Fifty-five sites were selected from a pool of 327 child welfare service areas in Canada, outside of Québec.[2] Five sites declined to be involved because of their particular circumstances, and five replacement sites were randomly selected from the remaining pool.

A total of eight Aboriginal agencies were involved in the ***CIS-2003***. Five Aboriginal agencies were contacted for recruitment but were unable to participate as a result of external demands on the organization, organizational change, or existing service demands. Multiple presentations were made to agencies in an effort to recruit them and to establish trust between the agency and members of the study team. Two agencies initially agreed to

participate in the study and then were unable to due to capacity issues. Although the intention was to have ten aboriginal agencies participate in the study, only eight aboriginal agencies are included in the final sample.

The second sampling stage involved selecting cases opened in each site over a three-month period between October 1, 2003 and December 31, 2003.[3] Three months was considered to be the optimum period to ensure high participation rates and good compliance with study procedures. Consultation with service providers indicated that case activity from October to December is considered to be typical of the whole year.

The third sampling stage involved screening opened cases to identify those cases that met ***CIS-2003*** definitions of suspected maltreatment. The Intake Face Sheet of the CIS Maltreatment Assessment Form was completed on all open cases. Investigating workers then evaluated each case to determine whether maltreatment was alleged by the referral source or suspected at any point in the investigation process. In cases where maltreatment was suspected, the remainder of the CIS Maltreatment Assessment form was completed.

The final case selection stage involved identification of the specific children who had been investigated. In many jurisdictions, cases are classified on the basis of family units, while in others each investigated child is counted as a case. In jurisdictions using family-based case counts, children who had been specifically investigated because of suspected maltreatment were identified, yielding a final sample of 11,562 investigated children.

The sample includes 2,328 investigations involving Aboriginal: 304 First Nations children served by a First Nation's agency, 1,244 First Nations children served by mainstream agencies and 476 Métis, Inuit, and other Aboriginal children.

As with any sample survey, estimates must be understood within the constraints of the survey instruments, the sampling design, and the estimation procedures used. Please refer to the Canadian Incidence Study of Reported Child Abuse and Neglect Major Findings Report (***CIS-2003***) for a full discussion about the ***CIS-2003*** methodology and a discussion of the strengths, limitations, and impact on interpreting the ***CIS-2003*** estimates. [4]

Aboriginal Definition

The Aboriginal population figure was derived from Census 2001 data.[5] According to Census documents, the Aboriginal identity population figures refer to "North American Indian, Métis or Inuit (Eskimo), and/or those who reported being a Treaty Indian or a Registered Indian as defined by the Indian Act of Canada and/or who were members of an Indian Band or First Nation." The Census population figures may differ from those calculated by INAC because of methodological and conceptual differences.

Aboriginal Analyses

For the purposes of this comparative report, First Nation status children and First Nation non-status children were combined and then categorized as living on or off reserve[6a]. Other Aboriginal children included Métis, Inuit and other Aboriginal children. Non-Aboriginal children were those children for whom the worker did not categorize as Aboriginal.

Most tables are limited to estimated counts of the number children in each Aboriginal category because we were unable to obtain reliable population estimates for on and off reserve children. **Tables 1a and 2a** provide population based incidence estimates by collapsing the three Aboriginal categories. Caution should be used in comparing the investigation statistics in the other tables because counts of number of investigations and differences in the distribution of these cases do not reflect the significant base-rate difference in incidence rates between Aboriginal and non Aboriginal children. For example, in **Table 2a** 13% of substantiated cases of maltreatment involving Aboriginal children involved physical abuse, compared to 29% for non-Aboriginal children. However, since Aboriginal children

were nearly 2.5 times more likely to be reported and substantiated, the incidence of substantiated physical abuse was in fact higher for Aboriginal children: 6.4 per thousand compared to 5.7 per thousand for non-Aboriginal children.

Given that the purpose of the report was to explore differences in profiles of and service responses to Aboriginal children compared to non-Aboriginal children, the statistical analyses in this report examine the differences in distribution of key characteristics of both groups. In most cases this is done using a Chi-square analysis[6b] of these distributions. Thus the significant difference reported in **Table 2a** means that there is a significant difference in the distribution of categories of maltreatment (13% physical abuse vs. 29%). However, this statistical analysis does not examine the difference in incidence rates (6.4 vs. 5.7)

Child Maltreatment Investigations by Level of Substantiation

Tables 1a and 1b describe investigations of maltreatment in terms of the three levels of substantiation specified by child protection workers involved in the *CIS-2003*:

A case is considered substantiated if the balance of evidence indicates that abuse or neglect has occurred.

A case is suspected if you do not have enough evidence to substantiate maltreatment, but you also are not sure that maltreatment can be ruled out.

A case is unsubstantiated if the balance of evidence indicates that abuse or neglect has not occurred.

Table 1a describes incidence rates for Aboriginal and non-Aboriginal children. Nearly 10% of Aboriginal children in Canada (95.3 per thousand Aboriginal children) are estimated to have been investigated in 2003 because of alleged maltreatment, over double the rate for non-Aboriginal children (42.2 per thousand). The rate of substantiated maltreatment was 2.5 times higher: 49 substantiated victims per thousand Aboriginal children compared to 19.8 per thousand non-Aboriginal children.

Table 1b provides the breakdown in substantiation rates by Aboriginal group. A higher proportion of child maltreatment investigations were substantiated for First Nations on reserve (51%), First Nations off reserve (51%), and other Aboriginal (55%) compared to non-Aboriginal (47%). In addition, a higher percentage of child investigations for First Nations off reserve and other Aboriginal were determined to be suspected following the completion of the initial investigation period.

Table 1a: Incidence of Child Maltreatment Investigations by Level of Substantiation in Canada in 2003, (Quebec Excluded)

	Aboriginal			Non-Aboriginal			Total
	%	# of Child Investigations	Rate per 1000	%	# of Child Investigations	Rate per 1000	
Substantiated	52	15,273	49.0	47	88,025	19.8	103,098

Canadian Study of Reported Child Abuse and Neglect 2003						$X^2=50.16$ $p<0.001$			

Analysis is based upon a sample of 11, 562 child maltreatment investigations with information about substantiation

Categories of Substantiated Maltreatment

Investigating child protection workers could identify up to three types of maltreatment for each investigation. Workers could choose from a list of twenty-five forms of maltreatment, under five categories of maltreatment (physical abuse, sexual abuse, neglect, emotional maltreatment and exposure to domestic violence). Note that because a case could include more than one form of maltreatment the columns in **Tables 2a to 3f** add up to more than the total number of substantiated cases. Estimates are not presented when there are insufficient cases sampled to provide a reliable estimate. In such cases, two dashes (--) appear in the table cell.

Incidence Rates: **Table 2a** shows that rates of substantiated maltreatment were similar or higher for Aboriginal children for all categories of maltreatment compared to non-Aboriginal children.

Physical Abuse: Significant differences were seen in the proportion of investigations that identified substantiated physical abuse for the four groups (First Nations on reserve, First Nations off reserve, other Aboriginal and non-Aboriginal). Twenty-nine percent of non-Aboriginal investigations indicated that physical abuse had been substantiated compared to 10% for First Nations off reserve and 11% for other Aboriginal.

Sexual Abuse: A higher proportion of non-Aboriginal investigations involved substantiated sexual abuse than for First Nations and other aboriginal categories.

Neglect: A much higher proportion of First Nations and Aboriginal investigations involved substantiated neglect compared to non-Aboriginal investigations. This ranged from 51% for First Nations on reserve to 65% for other Aboriginal.

Emotional Maltreatment: Seventeen percent of substantiated maltreatment investigations for First Nations off reserve noted emotional maltreatment. This proportion was higher for First Nation on reserve (27%), other Aboriginal (26%) and non-Aboriginal (24%).

Exposure to Domestic Violence: The proportion of substantiated child maltreatment investigations involving exposure to domestic violence ranged from 28% for other Aboriginal to 38% for First Nations on reserve.

Forms of Substantiated Physical Abuse

For the purposes of the *CIS-2003*, cases of investigated maltreatment were classified as physical abuse if the investigated child was suspected to have suffered or to be at substantial risk of suffering physical harm at the hands of his or her caregiver. The physical abuse category

Table 2a: Incidence of Categories of Substantiated Maltreatment in 2003 in Canada (Quebec Excluded)

	Aboriginal			Non-aboriginal			Total
	%	# of Child Investigations	Rate per 1,000 children	%	# of Child Investigations	Rate per 1,000 children

Canadian Study of Reported Child Abuse and Neglect 2003 *X^2, $p<.05$

Analysis is based upon a sample of 5,660 child maltreatment investigations with information about substantiation

includes five forms of abuse:

Shake, Push, Grab Or Throw: include pulling or dragging a child as well as shaking an infant.

Hit With Hand: include slapping and spanking but not punching.

Punch, Kick, Or Bite: include as well any other hitting with other parts of the body (e.g.: elbow or head).

Hit With Object: includes hitting with a stick, a belt or other object, throwing an object at a child, but does not include stabbing with a knife.

Other Physical Abuse: Any other form of physical abuse including choking, strangling, stabbing, burning, shooting, poisoning, and the abusive use of restraints.

Table 3a describes the proportion of substantiated physical abuse cases indicating each of the five forms of physical abuse by Aboriginal status. As noted in the previous section, investigating workers could identify up to three types of maltreatment for each investigation from a list of twenty-five forms of maltreatment. Note that because a case could include more than one form of maltreatment the columns in **Tables 2a to 3f** add up to more than the total number of substantiated cases. Estimates are not presented when there are insufficient cases sampled to provide a reliable estimate. In such cases, two dashes (--) appear in the table cell.

Table 3a indicates that the proportion of substantiated investigations involving at least one form of physical abuse was highest for non-Aboriginal investigations (29%). The proportion of substantiated physical abuse cases that involved shaking, pushing, grabbing or throwing was highest for other Aboriginal (48%), compared to non-Aboriginal physical abuse investigations (23%). A higher percentage of substantiated physical abuse investigations for First Nations off reserve (57%) involved hitting with a hand compared to other Aboriginal and non-Aboriginal (47%), and First Nations on reserve (30%). First Nations off reserve indicated the highest proportion of substantiated physical abuse cases involving a punch, kick or bite, while non-Aboriginal substantiated physical abuse investigations involved a higher percentage involving hitting with an object. Other forms of physical abuse were noted most frequently in

substantiated physical abuse investigations for First Nations on reserve.

Forms of Substantiated Sexual Abuse

It should be noted that the *CIS-2003* identified only cases reported to child welfare services; many cases of child sexual abuse that do not involve parents or relatives in the home are investigated only by the police, and child welfare services usually become involved in extra-familial sexual abuse cases only if there are concerns about the parents' ability to protect the child. The *CIS-2003* used eight forms to classify cases of sexual abuse:

Penetration: penile, digital or object penetration of vagina or anus.

Attempted Penetration: attempted penile, digital or object penetration of vagina or anus.

Oral Sex: oral contact with genitals by either perpetrator or by the child.

Fondling: touching or fondling of genitals for sexual purpose.

Sex Talk: verbal or written proposition, encouragement, or suggestion of a sexual nature (include face to face, phone, written and internet contact, as well as exposing the child to pornographic material).

Voyeurism: Included activities where the alleged perpetrator observes the child for the perpetrator's sexual gratification.

Exhibitionism: Included activities where the perpetrator is alleged to have exhibited himself/herself for his/her own sexual gratification.

Exploitation: Included situations where an adult sexually exploits a child for purposes of financial gain or other profit, including pornography and prostitution.

Table 3b describes the proportion of substantiated sexual abuse cases that involved each of the eight forms of sexual abuse by Aboriginal status. It is important to remember that estimates are not presented when there are insufficient cases sampled to provide a reliable estimate. In such cases, two dashes (--) appear in the table cell. The proportion of substantiated investigations involving at least

one form of sexual abuse was highest for non-Aboriginal child investigations. Fondling was the form of sexual abuse indicated most frequently in substantiated sexual abuse investigations for all categories.

Forms of Substantiated Neglect

Child neglect includes situations in which children have suffered harm, or their safety or development has been endangered as a result of the caregiver's failure to provide for or protect them. Unlike abuse, which is usually incident-specific, neglect often involves chronic situations that are not as easily identified as specific incidents. Nevertheless, all provincial and territorial statutes include neglect or some type of reference to acts of omission, such as failure to supervise or protect, as grounds for investigating maltreatment. The *CIS-2003* examines eight forms of neglect:

Failure To Supervise - Physical Harm: The child suffered or was at substantial risk of suffering physical harm because of the caregiver's failure to supervise and protect the child adequately. Failure to supervise included situations in which a child was harmed or endangered as a result of a caregiver's actions (e.g. drunk driving with a child, or engaging in dangerous criminal activities with a child).

Failure To Supervise - Sexual Abuse: The child has been or was at substantial risk of being sexually molested or sexually exploited, and the caregiver knew or should have known of the possibility of sexual molestation and failed to protect the child adequately.

Permitting Criminal Behaviour: A child has committed a criminal offence (e.g. theft, vandalism or assault) with the encouragement of the child's caregiver, or because of the caregiver's failure or inability to supervise the child adequately.

Physical Neglect: The child has suffered or was at substantial risk of suffering physical harm caused by the caregiver(s)' failure to care and provide for the child adequately. This includes inadequate nutrition/clothing, and unhygienic dangerous living conditions. There must be evidence or suspicion that the caregiver is at least partially responsible for the situation.

Medical Neglect: The child required medical treatment to cure, prevent, or alleviate physical harm or suffering, and the child's caregiver did not provide, refused, or was unavailable or unable to consent to the treatment. This included dental services where funding was available.

Failure To Provide Psych. Treatment: The child was at substantial risk of suffering from emotional harm as demonstrated by severe anxiety, depression, withdrawal, self-destructive or aggressive behaviour, or a mental, emotional, or developmental condition that could seriously impair the child's development. The child's caregiver did not provide, or refused, or was unavailable or unable to consent to treatment to remedy or alleviate the harm. This category includes failing to provide treatment for school-related problems such as learning and behaviour problems, as well as treatment for infant development problems such as non-organic failure to thrive. Parents awaiting service were not included in this category.

Abandonment: The child's parent has died or was unable to exercise custodial rights and did not make adequate provisions for care and custody, or the child was in a placement and the caregiver refused or was unable to take custody.

Educational Neglect: Caregivers knowingly allowed chronic truancy (five or more days a month), or failed to enroll the child, or repeatedly kept the child at home. If the child had been experiencing mental, emotional, or developmental problems associated with school, and treatment had been offered but caregivers did not cooperate with treatment, the case was classified under failure to provide treatment as well.

Table 3c describes the proportion of substantiated neglect investigations that involved each of the eight forms of neglect by Aboriginal status. The proportion of substantiated investigations involving at least one form of neglect was higher for each of the three First Nations or other Aboriginal groups compared to non-Aboriginal. This ranged from 51% for First Nations on reserve, 62% for First Nations off reserve to 65% for other Aboriginal. Thirty percent of Non Aboriginal substantiated investigations involved at least one type of substantiated neglect.

Canadian Study of Reported Child Abuse and Neglect 2003 *X^2, $p<0.05$

Analyses are based upon a sample of 2,077 child maltreatment investigations with substantiated neglect

A higher proportion of non-Aboriginal investigations involving substantiated neglect indicated failure to supervise leading to physical harm or failure to supervise leading to sexual harm, compared to First Nations (on or off reserve) or other Aboriginal. In contrast, a higher proportion of substantiated neglect cases for First Nations (on or off reserve) and other Aboriginal indicated physical neglect or educational neglect.

Forms of Substantiated Emotional Maltreatment

Three forms of emotional maltreatment were designed to be tracked by the *CIS-2003*. A fourth form, exposure to non-intimate partner violence, was added after the start of the study to deal with the relatively large number of such investigations.

Emotional Abuse: The child has suffered or was at substantial risk of suffering from mental, emotional, or developmental problems caused by overtly hostile, punitive treatment, or habitual or extreme verbal abuse (threatening, belittling, etc.).[8]

Non-organic Failure To Thrive: A child under 3 has suffered a marked retardation or cessation of growth for which no organic reasons can be identified. Failure to thrive cases where inadequate nutrition was the identified cause were classified as physical neglect. Non-organic failure to thrive is generally considered to be a form of psychological maltreatment; it has been classified as a separate category because of its particular characteristics.

Emotional Neglect: The child has suffered or is at substantial risk of suffering from mental, emotional, or developmental problems caused by inadequate nurturance/affection. If treatment was offered but caregivers were not cooperation, cases were classified under failure to provide treatment as well.

Exposure To Violence Between Adults Other Than Caregivers: A child has been a witness to violence occurring between adults in the child's home environment (for example the child's father and an acquaintance), excluding exposure to domestic violence.

Table 3d presents the proportion of substantiated emotional maltreatment cases that involved each of the four forms of emotional maltreatment by Aboriginal status. The proportion of substantiated investigations involving at least one form of emotional maltreatment was fairly

similar for First Nations on reserve (27%), First Nations off reserve (17%), other Aboriginal (26%), and non-Aboriginal groups (24%). A higher percentage of substantiated emotional maltreatment investigations for non-Aboriginal children (74%) noted emotional abuse, while First Nations on reserve (60%) noted a higher proportion of emotional neglect.

Substantiated Exposure to Domestic Violence

Although exposure to domestic violence is often categorized as a form of emotional maltreatment, most Canadian jurisdictions have developed policies and practices specific to exposure to domestic violence. To facilitate the analysis of this rapidly expanding form of maltreatment it is described in this report as its own category.

Exposed To Domestic Violence: A child has been a witness to violence occurring between the caregivers (or a caregiver and his/her partner). This would include situations where the child indirectly witnessed the violence (e.g. saw the physical injuries on his/her caregiver the next day or overheard the violence).

Table 3e describes the proportion of all substantiated investigations that indicated exposure to domestic violence. The proportion of substantiated investigations involving at exposure to domestic violence was highest for First Nations on reserve (38%), followed by non-Aboriginal (35%), First Nations off reserve (29%) and other Aboriginal (28%).

Single and Multiple Forms of Substantiated Child Maltreatment

Table 3f presents the number of substantiated investigations involving single and multiple forms of maltreatment. Because most jurisdictions currently track single forms of maltreatment, it is likely that the investigating workers who completed *CIS-2003* forms were unaccustomed to classifying cases under more than one form, and that the *CIS-2003* may therefore underestimate the actual incidence of multiple maltreatment.

The proportion of substantiated maltreatment investigations indicating a single substantiated form was highest for First Nations off reserve (82%) followed by non-Aboriginal (81%), other

[1] *forms combined with sexual abuse not included since Ns very small*

Aboriginal (76%), and First Nations on reserve (67%). The percentage of substantiated child investigations involving substantiated physical abuse only, sexual abuse only and emotional maltreatment only was higher for non-Aboriginal child investigations than for First Nations or other Aboriginal child investigations. The proportion of substantiated cases involving neglect only was consistently higher for the three First Nations (on or off reserve) and other Aboriginal groups.

Multiple forms of substantiated maltreatment was noted in 33% of substantiated investigations for First Nations on reserve, 24% of other Aboriginal, 19% of non-Aboriginal, and 18% of First Nations off reserve. The percentage of substantiated cases involving multiple forms of maltreatment was fairly low for all groups.

Child Age in Substantiated Maltreatment Investigations

Table 4 presents child age categories in substantiated child maltreatment investigations by Aboriginal status. The proportion of substantiated investigations involving children less than one year of age was highest for other Aboriginal (18%). In contrast, only seven percent of substantiated investigations for the First Nations on reserve category involved children less than one year of age. Fifteen percent of substantiated investigations involving First Nations on reserve children concerned children 2-3 years of age, while 10 percent of substantiated investigations involving non-Aboriginal children concerned children 2-3 years of age.

Child Risk Factors For Substantiated Child Maltreatment Investigations

Child functioning was documented on the basis of a checklist of problems that child welfare workers were likely to be aware of as a result of their investigation. The child functioning checklist (see Maltreatment Assessment Form) was developed in consultation with child welfare workers and researchers to reflect the types of concerns that may be identified during an investigation. The checklist is not a validated measurement instrument for which population norms have been established.[9] The checklist documents only problems that child welfare

workers became aware of during their investigation and therefore undercounts the occurrence of child functioning problems.[10] Nevertheless, it provides an important estimate of the types of concerns that are identified during child maltreatment investigations.

Investigating workers were asked to indicate problems that had been confirmed by a formal diagnosis and/or directly observed, as well as issues that they suspected were problems but could not fully verify at the time of the investigation.[11] The six-month period before the investigation was used as a reference point where applicable. Child functioning classifications that reflect physical, emotional, cognitive, and behavioural issues were documented with a checklist that included the following categories:

Depression Or Anxiety: Feelings of depression or anxiety that persist for most of every day for two weeks or longer, and interfere with the child's ability to manage at home and at school.

ADD/ADHD: Attention Deficit Disorder/ Attention Deficit Hyperactivity Disorder included: distractibility; impulsivity; hyperactivity. These behaviours are very noticeable, occur over a long period of time in many situations, and are troublesome to others.

Negative Peer Involvement: Child has been involved in high-risk peer activities, such as gang activities, graffiti or vandalism.

Alcohol Abuse: problematic consumption of alcohol (consider age, frequency and severity).

Drug/solvent Abuse: included prescription drugs, illegal drugs and solvents.

Self-harming Behaviour: Child has engaged in high-risk or life-threatening behaviour such as suicide attempts, physical mutilation or cutting.

Violence Towards Others: Child has displayed aggression and violence toward other children or adults.

Running (One Incident): Child has run away from home (or other residence) on one occasion, for at least one overnight period.

Running (Multiple Incidents): Child has run away from home (or other residence) on more than one occasion for at least one overnight period.

Inappropriate Sexual Behaviour: Child has been involved in inappropriate sexual behaviour.

Other Emotional Or Behvaioural Problem: The child has significant emotional or behavioural problems other than those describes above.

Learning Disability: A child has identified learning deficits in one or more areas of mental functioning (e.g. language usage, numbers, speech, reading, word comprehension).

Specialized Education Services: Child has been involved in special education program for learning disability, special needs, or behaviour problems.

Irregular School Attendance: Child has shown irregular attendance and truancy (more than 5 days/month).

Developmental Delay: Child has delayed intellectual development. Typically it is diagnosed when a child does not reach his/her developmental milestones at expected times. It includes speech and language development, fine and gross motor skills and or personal and social skills.

Physical Disability: The child has a long-lasting condition that substantially limits one or more basic physical activities such as walking, climbing stairs, reaching, lifting or carrying. This includes sensory disability conditions such as blindness, deafness or a severe vision or hearing impairment that noticeably affects activities of daily living.

Substance Abuse Related Birth Defect: Child has a diagnosis or indication of birth defect(s) related to substance abuse by the biological parent (e.g. Fetal Alcohol Syndrome (FAS)/Fetal Alcohol Effect (FAE), cocaine addiction or solvent abuse).

Positive Toxicology At Birth: The child, at birth, tests positive for the presence of drugs or alcohol.

Other Health Condition: Child has ongoing physical health condition (e.g. chronic disease, and frequent hospitalization).

Psychiatric Disorder: Child has diagnosis of psychiatric disorder by a psychiatrist (e.g. conduct disorder, anxiety disorder).

Youth Criminal Justice Act Involvement: Child has been involved in charges, incarceration, or alternative measures with the youth justice system.

Other: Any other child or family focused referral

Canadian Study of Reported Child Abuse and Neglect 2003 *X^2, $p<0.05$

Analysis is based upon a sample of 5,660 child maltreatment investigations with substantiated maltreatment

Table 5 presents child functioning characteristics that affect the physical, emotional, and cognitive health of children for substantiated child maltreatment investigations. Overall, for substantiated maltreatment investigations, First Nations on reserve children, First Nations off reserve children and other Aboriginal children had higher rates of child functioning issues than substantiated investigations involving non-Aboriginal children.

Twenty-four percent of substantiated investigations involving First Nations on reserve children noted depression or anxiety, 18% of substantiated investigations involving non-Aboriginal children noted depression or anxiety, 16% of substantiated investigations of other Aboriginal children noted depression or anxiety and 13% of substantiated investigations involving First Nation off reserve children noted depression or anxiety.

Forty-two percent of substantiated investigations involving First Nations on reserve children noted other behavioural or emotional problems. In comparison, 18% of substantiated investigations for other Aboriginal children noted other behavioural or emotional problems. Irregular school attendance was noted in 31 % of substantiated investigations involving First Nations on reserve children, 28 % involving other Aboriginal children and 23 % involving First Nations off reserve children. In comparison, 11 % of substantiated investigations involving non-Aboriginal children noted irregular school attendance. Thirty-one percent of substantiated investigations involving First Nations on reserve children noted a developmental delay. Eleven percent of substantiated investigations involving non-Aboriginal children noted a developmental delay.

Nine percent of substantiated investigations involving First Nations on reserve children, 8 percent of First Nations off reserve children and 6 percent of other Aboriginal noted substance abuse related birth defects. In comparison, 2 percent of substantiated investigations involving non-aboriginal children noted substance abuse related birth defects. Five percent of substantiated investigations involving other Aboriginal children noted positive toxicology at birth compared to 2% First Nations off reserve children, and 1% non-Aboriginal children).

Physical and Emotional Harm in Substantiated Child Maltreatment Investigations

The *CIS-2003* tracked physical harm suspected or known to be caused by the investigated maltreatment. Information on physical harm was collected using two scales, one describing severity of harm as measured by medical treatment need and one describing the nature of harm.

Information on emotional harm was collected using a series of questions asking child welfare workers to describe emotional harm that had occurred after the maltreatment incidents. Workers were asked to include changes in the child's development (regression, withdrawal), self-regulation (sleep patterns, elimination), or emotions (child crying, clinging, or anxious) that they had observed or that had been described to them. These maltreatment-specific descriptions of emotional harm are not to be confused with the general child functioning ratings noted in **Table 5**.

Table 6 presents physical and emotional harm in substantiated child maltreatment investigations by Aboriginal group. At least one type of physical harm was noted in 10% of substantiated investigations involving non-Aboriginal children. For Aboriginal children, physical harm was note in 9 % of substantiated investigations involving First Nations off reserve children, 6 % involving First Nations on Reserve children and 5% involving other Aboriginal children.

First Nations on reserve children had the highest rates of noted emotional harm. Thirty-three percent of substantiated investigations involving First Nations on reserve children noted emotional harm during the course of the maltreatment investigations. Rates of emotional harm were lower for other groups. Twenty-one percent of substantiated investigations involving First Nations off reserve children noted emotional harm

Table 6: Physical and Emotional Harm in Substantiated Child Maltreatment Investigations, (Quebec Excluded)

	First Nations On Reserve		First Nations Off Reserve		Other Aboriginal		Non-Aboriginal		Total
	%	# of Child Investigations	%	# of Child Investigations	%	# of Child Investigations	%	# of Child Investigations	
At least one physical harm*	6	222	9	794	5	151	10	9,056	10,223

Canadian Study of Reported Child Abuse and Neglect 2003 * X^2, $p<.05$

Analysis is based upon a sample of 5,660 child maltreatment investigations with substantiated maltreatment

and 14% of substantiated investigations involving other Aboriginal children noted emotional harm. In 20% of substantiated investigations involving non-Aboriginal children emotional harm was noted.

Family Risk Factors for Substantiated Child Maltreatment Investigations

Table 7 presents information on a number of family risk factors in substantiated child maltreatment investigations, including single parent status, housing accommodation, housing safety and overcrowding, source of income and recent family moves.

The *CIS-2003* gathered information on up to two of the child's parents or caregivers.[12] For each listed caregiver, investigating workers were asked to choose the category that best described the relationship between the caregiver and the children in the home. If a caregiver was a biological parent to one child and a step-parent to another child in the family, workers were asked to use "step-parent" to describe that caregiver.[13] If recent household changes had occurred, investigating workers were asked to describe the situation at the time the referral was made.

Investigating workers were asked to select the housing accommodation category that best described the investigated child's household living situation. The types of housing included:

Own Home: A purchased house, condominium, or townhouse.

Rental Accommodation: A private rental house, townhouse or apartment.

Public Housing: A rental unit in a public housing complex (i.e. rent-subsidized, government-owned housing), a house, townhouse or apartment on a military base, or band housing.

Shelter/Hotel: A homeless or family shelter, SRO hotel (single room occupancy), or motel accommodation.

Unknown: Housing accommodation was unknown.

Other: Any other form of shelter.

In addition to housing type, investigating workers were asked to indicate whether the investigated child lived in unsafe housing conditions where children were at risk of injury or impairment from their living situation (e.g. broken windows, insufficient heat, parents and children sharing single room). Workers also noted if the family had moves within the past year.

Investigating workers were requested to choose the income source that best described the primary source of the household income. Income source was designated by investigating workers in terms of five possible classifications:

Full Time Employment: A caregiver is employed in a permanent, full-time position.

Employment Insurance (EI)/Social Assistance/ Other Benefit: Family income is derived primarily from employment insurance, social assistance or other benefits (e.g. long-term disability, pension, or child support).

Table 7 indicates that substantiated investigations involving First Nations off reserve children noted the highest proportion of single parents (53%). Substantiated investigations involving First Nations on reserve children noted the lowest proportion of single parents (38%).

Aboriginal families had the lowest rates of home ownership. In 14% of substantiated investigations involving First Nations on reserve children workers indicated that the family owned their own home. Nine percent of substantiated investigations involving First Nations off reserve children noted home ownership and 7% of investigations involving other Aboriginal children noted home ownership. In comparison, 36% of substantiated investigations involving non-Aboriginal children noted home ownership.

Thirty-two percent of substantiated investigations involving other Aboriginal children noted unsafe housing conditions, compared to 20% of investigations involving First Nations on reserve children and 21% involving First Nations off reserve children. In comparison, 7% of substantiated investigations involving non-Aboriginal children noted unsafe housing conditions.

Overcrowding was noted as an issue in 24% of substantiated investigations involving First Nations on reserve children, in 25% of substantiated investigations involving other Aboriginal children and in 14% of substantiated investigations involving First Nations off reserve children. In comparison, 7% of substantiated investigations involving non-Aboriginal children noted overcrowding.

Aboriginal caregivers were less likely to have full time employment than non-Aboriginal caregivers.

Table 7: Family Risk Factors for Substantiated Child Maltreatment Investigations, (Quebec Excluded)

Canadian Study of Reported Child Abuse and Neglect 2003 *X^2, $p<0.001$

Analysis is based upon a sample of 5,660 child maltreatment investigations with substantiated maltreatment

Twenty-six percent of substantiated investigations involving First Nations on reserve children noted full time employment, 27 percent of substantiated investigations involving First Nations off reserve children noted full time employment and 22 % of substantiated investigations involving other Aboriginal children noted full time-employment. In comparison, 62% of substantiated investigations involving non-Aboriginal caregiver noted full time employment.

Substantiated investigations involving other Aboriginal children had the highest proportion of moves within the past year (45%), followed by investigations involving First Nations off reserve children (31%).

Caregiver Risk Factors for Substantiated Child Maltreatment Investigations

Concerns related to caregiver functioning and family stressors were examined by investigating workers using a checklist of 10 items that were asked about each caregiver. Where applicable, the reference point for identifying concerns about caregiver functioning was the previous six months.[14] The checklist included

Alcohol Abuse: the use of alcohol poses a problem for the household.

Drug/solvent Abuse: at least one caregiver abuses prescription drugs, illegal drugs or solvents.

Criminal Activity: At least one caregiver is absent due to incarceration, or is involved in criminal activity (drug dealing, theft or prostitution). This did not include a criminal history for domestic violence.

Cognitive Impairment: The cognitive ability of at least one caregiver is known to or suspected to have an impact on the quality of care giving provided in the household.

Mental Health Issues: At least one caregiver is known or suspected to have mental health problems.

Physical Health Issues: At least one caregiver is known or suspected to have a chronic illness, frequent hospitalizations, or a physical disability.

Few Social Supports: At least one caregiver is known or suspected to be socially isolated or lacking in social supports.

Maltreated As A Child: Either caregiver is known or suspected to have suffered maltreatment as a child.

Victim Of Domestic Violence: during the past six months the caregiver was a victim of domestic violence including physical, sexual or verbal assault.

Other: Any other issue/concern describing caregiver functioning.

Table 8a and b represent the caregiver risk factors that the worker noted for the female and male caregiver respectively. The average number of female caregiver risk factors was highest for substantiated investigations involving First Nations off reserve children (3.4 average risk factors) and First Nations on and off reserve children for male caregivers (2.1 average risk factors). Substantiated investigations involving non- Aboriginal children were lowest for both female (1.8 average risk factors) and male caregivers (0.9 risk factors).

High rates of alcohol abuse for female caregivers were noted in substantiated investigations involving First Nations off reserve children (58%), First Nations on reserve (44%) and other Aboriginals (43%). High rates of alcohol abuse in male caregivers were noted in investigations involving First Nations children on reserve (42%), other Aboriginal (33%) and First Nations off reserve (31%).

Few social supports were noted as significant risk factors in both female and male caregivers. Sixty- one percent of female caregivers involving other Aboriginal children noted few social supports followed by First Nations off reserve (50%) and First Nations on reserve (49%). For male caregivers, few social supports were noted in investigations of First Nations children on reserve (23%), other Aboriginal (22%) and First Nations off reserve (19%).

Table 8a also indicates 64% of investigations involving female caregivers of First Nations children on reserve were victims of domestic violence, 59% of First Nations off reserve, 49%

other Aboriginal and 47% for non- Aboriginal child investigations.

Recurrence and Duration of Maltreatment in Substantiated Child Maltreatment Investigations

Table 9 presents information on the recurrence and duration of maltreatment in substantiated child maltreatment investigations by Aboriginal group. Eighty percent of substantiated investigations involving First Nations on reserve children noted that the family had been previously identified to child welfare services. Eight-four percent of substantiated investigations involving First Nations off reserve children noted a previous family opening and 75% of investigations involving other Aboriginal children noted a previous family opening. Fifty-nine percent of substantiated investigations involving non-Aboriginal children noted a previous child welfare opening.

Substantiated investigations involving First Nations on reserve children had the highest proportion of cases involving the duration of the maltreatment lasting more than 6 months (56%). Forty-one percent of substantiated investigations involving non-Aboriginal children noted maltreatment lasting more than 6 months.

outcomes related to whether the case remains open for ongoing services, an application is made to child welfare court, there was a police investigation and charges laid. Investigating workers were asked whether the investigated case would remain open for ongoing child welfare services after the initial investigation. Workers completed these questions on the basis of the information available at that time or upon completion of the intake investigation.

Application to child welfare court can be made for an order of supervision (child remaining in the home), temporary wardship (for a set time period), or permanent wardship. The *CIS-2003* tracked the number of applications made or being considered during the initial investigation, but did not track the types of applications. Workers were also asked to report on whether or not they had made a referral to a mediation or alternative response. Because applications may have been made at a point following the *CIS-2003* study period, the *CIS-2003* court involvement figures should be treated as underestimates of the true rate of court involvement. Court status was tracked in terms of three possible worker responses:

Application Made: An application to child welfare court was submitted.

Application Considered: The child welfare worker was considering whether or not to submit an application to child welfare court.

No Application Considered: Court involvement was not considered.

In many jurisdictions in Canada there are detailed protocols between child welfare and police services, resulting in rising levels of co-operation. This co-operation includes cases of physical and sexual abuse as well as cases of domestic violence. Most jurisdictions require police to report adult domestic violence cases to the child welfare authorities if children are living in the family. The CIS–2003 captured information about police involvement in adult domestic violence cases as well as in all other child maltreatment investigations.

As with the other interventions during investigations described in this chapter, the *CIS-2003* tracked only events that occurred during the initial child welfare investigation; it is therefore possible that police decided to lay charges or became involved in some cases after the *CIS-2003* information forms had been completed. It should be noted further that the police also investigate many non-familial child maltreatment cases that do not involve child welfare services.15

As illustrated in **Table 10**, 68% of substantiated investigations involving First Nations on reserve children received ongoing services at the conclusion of the child maltreatment investigation. In comparison, 41 percent of substantiated investigations involving non-Aboriginal children received ongoing services.

Substantiated investigations involving aboriginal families had the highest rates of child welfare court application. In thirteen percent of substantiated investigations involving both First Nations off reserve children and other Aboriginal children an application to child welfare court was made. In ten percent of substantiated investigations involving First Nations on reserve children an application to child welfare court was made and in 6 percent of investigations involving non-Aboriginal children an application to child welfare court was made.

Placement for Substantiated Child Maltreatment Investigations

Admissions to out-of-home care at any time during the investigation were tracked. If there were multiple placements, workers were asked to indicate the setting where the child had spent the most time. The following placement classifications were used:

No Placement Required: No placement was required following the investigation.

Placement Is Being Considered: At this point of the investigation, an out-of home placement is still being considered.

Informal Kinship Care: An informal placement has been arranged within the family support network (kinship care, extended family, traditional care), the child welfare authority does not have temporary custody.

Table 10: Physical and Emotional Harm in Substantiated Child Maltreatment Investigations, (Quebec Excluded)

	First Nations On Reserve		First Nations Off Reserve		Other Aboriginal		Non-Aboriginal		Total
	%	# of Child Investigations	%	# of Child Investigations	%	# of Child Investigations	%	# of Child Investigations

Canadian Study of Reported Child Abuse and Neglect 2003 *X^2, $p<0.001$

Analysis is based upon a sample of 5,660 child maltreatment investigations with substantiated maltreatment

Kinship Foster Care: A formal placement has been arranged within the family support network (kinship care, extended family, customary care), the child welfare authority has temporary or full custody and is paying for the placement.

Other Family Foster Care: Includes any family based care, including foster homes, specialized treatment foster homes, and assessment homes.

Group Home Placement: An out-of-home placement required in a structured group living setting.

Residential/Secure Treatment: Placement required in a therapeutic residential treatment centre to address the needs of the child.

Table 11 presents information on the placement decisions that occurred at the end of the child protection investigation. Placement was considered in 8% of substantiated investigations involving First Nations on reserve children, compared to 3% of investigations involving First nations off reserve children, 3% of investigations involving other Aboriginal children and 4% of investigations involving non-Aboriginal children. Informal kinship care was noted in 17% of substantiated investigations involving First Nations on reserve children. Other Aboriginal children had the highest rate of informal kinship care (22% of substantiated investigations). In comparison, for substantiated investigations involving non-Aboriginal children, 4% resulted in informal kinship care. Seven percent of substantiated investigations involving First Nations on reserve children resulted in kinship care, compared to 4% involving First Nations off reserve children, 3% other Aboriginal children and 1% non-Aboriginal Children. Sixteen percent of substantiated investigations involving other Aboriginal children resulted in other family foster care compared to 4% for First Nations on reserve children, 7 percent First Nations off reserve children and 4% non-Aboriginal children.

Referral Sources for Substantiated Child Maltreatment Investigations

Each independent contact with the child welfare agency or office regarding a child/children or family was counted as a separate referral. The person who actually contacted the child welfare agency/office was identified as the referral source. For example, if a child disclosed an incident of abuse to a schoolteacher, who made a report to child welfare services, the school was counted as a referral source. However, if both the schoolteacher and the child's parent called, both would be counted as referral sources.

The Maltreatment Assessment Form included 18 pre-coded referral source categories and an open "other" category. Referral categories were collapsed into professionals, family, relatives or acquaintances and other sources of referral.

Table 11: Placement for Substantiated Child Maltreatment Investigations, (Quebec Excluded)

Non-Professional Referral Sources:

Parent: This includes parents involved as a caregiver to the reported child, as well as non-custodial parents.

Child: A self-referral by any child listed on the Intake Face Sheet of the ***CIS-2003*** Maltreatment Assessment Form.

Relative: Any relative of the child in question. Workers were asked to code "other" for situations in which a child was living with a foster parent and a relative of the foster parent reported maltreatment.

Neighbour/Friend: This category includes any neighbour or friend of the children or his/her family.

Anonymous: A caller who is not identified.

Other Referral Source: Any other source of referral.

Professional Referral Sources:

Community Agencies: This includes social assistance worker (involved with the household), crisis service/shelter worker (includes any shelter or crisis services worker) for domestic violence or homelessness, community recreation centre staff (refers to any person from a recreation or community activity programs), day care centre staff (refers to a childcare or day care provider), and community agency staff.

Health Professional: This includes hospital referrals that originate from a hospital made by either a doctor, nurse or social worker rather than a family physician's office, public health nurse (nurses involved in services such as family support, family visitation programs and community medical outreach), and physician (any family physician with a single or ongoing contact with the child and/or family).

School: Any school personnel (teacher, principal, teacher's aide etc.)

Table 12: Referral Sources for Substantiated Child Maltreatment Investigations, (Quebec Excluded)

	First Nations On Reserve		First Nations Off Reserve		Other Aboriginal		Non-Aboriginal		Total

Analysis is based upon a sample of 5,660 child maltreatment investigations with substantiated maltreatment									

Mental Health Professional/agency: Includes family service agencies, mental health centres (other than hospital psychiatric wards), and private mental health practitioners (psychologists, social workers, other therapists) working outside of a school/hospital/child welfare/Youth Justice Act setting.

Other Child Welfare Services: Includes referrals from mandated Child Welfare service providers from other jurisdictions or provinces.

Police: Any member of a Police Force, including municipal, provincial/territorial or RCMP.

Table 12 presents information on the referral sources for substantiated child maltreatment investigations by Aboriginal group. Substantiated investigations for First Nations on reserve children had the lowest rate of referral by professionals (54%), compared to 59% for First Nations off reserve children, 75% for other Aboriginal children and 73% for non-Aboriginal children. Conversely, substantiated investigations for First Nations on reserve children had the highest rates of referrals from family, relatives or acquaintances, 38%, compared to 23% for First Nations off reserve children, 23% for other Aboriginal children and 19% for non-Aboriginal children.

Conclusions

A number of striking differences emerge from this preliminary comparative analysis of child welfare investigations of Aboriginal and non-Aboriginal children. From the very outset, Aboriginal children are more than twice as likely to be investigated compared to non-aboriginal children. Once investigated, cases involving Aboriginal children are more likely to be substantiated, more likely to require on-going child welfare services, more than twice as likely to be placed in out of home care, and more likely to be brought to child welfare court. The profiles of Aboriginal families differ dramatically from the profile of non-Aboriginal families. Aboriginal cases predominantly involve situations of neglect where poverty, inadequate housing and parent substance abuse are a toxic combination of risk factors. Surprisingly, fewer differences were noted at the level of the children themselves.

The most systematic pattern to emerge from this first analysis highlights the differences between Aboriginal and non-Aboriginal children. It would be helpful to discuss with Aboriginal service providers any on/off-reserve differences that have not been highlighted by this statistical analysis.

Multivariate analyses controlling for some of the differences between Aboriginal and non-Aboriginal families should be undertaken to better understand the factors underlying the differences

in service response. Regardless of these possible explanations, it is apparent that one should expect the cost of providing services to Aboriginal children to be significantly higher given that these cases involve a significantly higher rate of intervention at every point of contact.

(Footnotes)

1 Québec is excluded from the estimates in this report because of differences in the way data were collected in Québec.

2 A list of 327 provincial and territorial child welfare service areas (CWSAs) was drawn up on the basis of information received from each province and territory. A similar search developed a list of Aboriginal agencies providing child protection services. Eight Aboriginal sites participated in the study. CWSAs varied greatly in size. For example, three agencies made up one CWSA for the City of Toronto, with a total of 11 offices.

3 Due to later recruitment 5 sites collected data from November 1, 2003 – January 31, 2004. Quebec used two different data collection periods to create the sample of three months.

Ottawa: Public Health Agency of Canada, Government of Canada, 2005.

5 Canada. Statistics Canada. Census of Canada, 2001: Aboriginal Identity Population, Registered Indian Status, Age Groups, Sex and Area of Resident for Population, for Canada, Provinces and Territories, 2001 Census – 20% Sample Data [computer file]. Ottawa: Ont.: Statistics Canada [producer and distributor], October 22, 2002 (97F0011XCB01005).

6a. Information was not collected on whether Aboriginal children resided on or off reserve. This information was collected for Aboriginal caregivers and thus, categories were derived from caregiver variables.

6b To avoid having weights inflate the Chi-squares, the weighted estimates were weighted down to the original sample size.

7 Some CIS reports only use the primary category, in this report primary and secondary categories are counted.

8 Instances in which children were displaying severe emotional problems requiring treatment and parents refused or did not cooperate with offered treatment were classified as neglect cases under failure to provide treatment.

9A Number of child functioning measures with established norms exist; however, these are not consistently used in child welfare settings and could not be feasibly used in the context of the CIS.

10 Although child welfare workers assess the safety of children, they do not routinely conduct a detailed assessment of child functioning. Items on the checklist included only issues that workers happened to become aware of during their investigation. A more systematic assessment would therefore likely lead to the identification of more issues than noted by workers during the CIS.

11 This report refers to both confirmed and suspected problems as "indicated".

12 The two-caregiver limit was required to accommodate the form length restrictions set for the Household Information Sheet. The caregiver information usually corresponded to the parents and/or step-parent living in the home; if there was only one caregiver living in the home and a second living outside the home, information was gathered on both of these, but is not reported here.

13 This compromise was needed because the Household Information Sheet served as a common information source for all the children in the family. A much more extensive set of questions would have been required had the CIS-2003 gathered child-specific caregiver information, leading to a significantly longer form. Child-specific information on the caregiver-child relationship is available for caregivers who were investigated as alleged

perpetrators (see chapter 4).

14 Most items were rated on a 4-point scale differentiating "confirmed", "suspected", "no" and "unknown" caregiver functioning issues. A caregiver functioning or family stressor was classified as confirmed if a problem had been diagnosed, observed by the investigating worker or another worker, or disclosed by the caregiver. An issue was classified as suspected if investigating workers` suspicions were sufficient to include the concern in their written assessment of the family or in transfer summary to a colleague. For the purposes of the present report, the categories of confirmed and suspected have been collapsed. A comparison of the ratings will be completed in subsequent analyses.

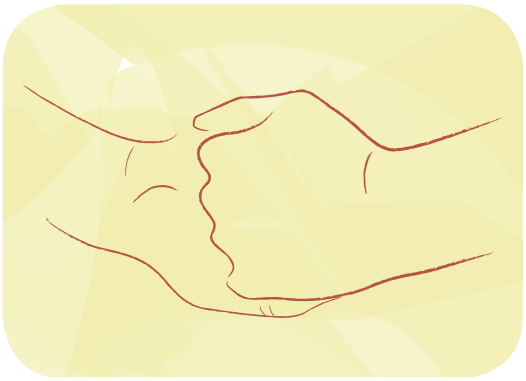
Jordan's Principle: A Child First Approach to Jurisdictional Issues



CHAPTER 3

Prepared on behalf of:
First Nations Child & Family Caring Society Canada

Written by:
Kelly A. MacDonald, B.A., LL.B., LL.M.
Kylie Walman, B.A., University of B.C. Law Student (year two)

March, 2005

I. INTRODUCTION

As the federal and provincial/territorial governments sort out their respective jurisdictional and funding responsibilities, the urgent needs of children and families are falling through government jurisdictional cracks. This is particularly the case for families that move on and off reserve, who and [sic] experience dramatic changes in the range and access to culturally based services. Funding formulas and jurisdictional arrangements must put the needs of children and families first. [1]

This research paper was contracted by the First Nations Child and Family Caring Society of Canada, to examine:

a) The implications of laws pertinent to child welfare and law relevant to jurisdictional disputes between federal government departments and between provinces and the federal government for the development of policy/procedure to manage jurisdictional disputes in First Nations Child Welfare.

b) The legal considerations in developing processes to resolve jurisdictional disputes (with a particular focus on whether or not the current approach of having no uniform process for resolving such disputes is acceptable).

A comprehensive review of literature and case law was completed. As well, approximately 20 key informants were interviewed, in order to assess the current state of First Nations child and family service delivery with regards to jurisdiction. Please note that the names of key informants are not noted in order to ensure confidentiality.

This paper is organised beginning with an overview of jurisdictional issues – including (Section II) an examination of federal/provincial/territorial and inter-ministerial (federal) jurisdictional issues. A case law review and analysis is provided, with a synopsis of the international rights of children. In addition, a discussion of the Social Union Framework Agreement is included.

Section III provides a discussion of dispute mechanisms and Section IV sets out recommendations culled from the literature and developed for the purposes of this paper.

The issues surrounding jurisdictional responsibilities and funding for First Nations Child and Family Services have been long-standing. This paper contributes to the work of the First Nations Child and Family Caring Society of Canada (FNCFCS) in seeking some positive resolution to these issues. The FNCFCS is committed to working with other stakeholder groups in order to ensure that First Nations children receive the care that they require and that they are entitled to. Developing mechanisms to resolve the "adult"/government issues that affect First Nations children, and in many cases disadvantage them, are of an urgent and pressing concern. Our children are our future.

II. JURISDICTIONAL OVERVIEW

…special status of Indian people has been used as a justification for providing them with services inferior to those available to Whites who established residence in this country, which was once theirs.[2]

As identified by Hawthorne (above) almost 40 years ago, the "jurisdictional dispute" between the federal and provincial/territorial governments, regarding who has the ultimate legislative, constitutional, fiscal, and moral responsibility for First Nations people (children) has had an impact on the availability of services and programs for First Nations children.

Despite the breadth of research and literature concerning the impact of this "dispute" on services for Aboriginal children and despite the federal government's own expressions of commitment to this issue, the jurisdictional debate continues. The literature canvassed highlights the impact of this dispute, not only on child and family services but also on the delivery of other social services such as health. Moreover, the discussion has expanded to include concerns and problems/issues with inter-ministerial jurisdictional disputes.

An *ad hoc* coalition comprised of: the Atlantic Policy Congress of First Nations Chiefs, the Commission on Peace and Justice (Canadian Council of Churches), First Nations Child and Family Caring Society of Canada, KAIROS (Canadian Ecumenical Justice Initiative) and the Southern Chiefs Organisation (Manitoba) – expressed concern, in their NGO submission to the United Nations, in relation to the impact of jurisdictional disputes:

> …Canada is not, based on its second report to the UN sufficiently aware of the deficiencies inherent in existing initiatives and funding practices. Too often, current programs targeted at Aboriginal peoples respond to immediate needs, without focusing on the undercurrents that shaped them. Child maltreatment is one example.[3]

This continual jurisdictional wrangling results in program fragmentation, problems with co-ordinating programs and reporting mechanisms, gaps in service delivery - thereby leaving First Nations children to fall through the cracks. In short, neither the federal or provincial/territorial governments have effectively addressed the community needs of First Nations despite awareness of the impact of "policies of avoidance". Proper consultation with First Nations and co-operation on initiatives such as the National Policy Review and this project will hopefully assist in alleviating some of these problems.

Clearly something needs to be done to resolve this situation and to bring the standards of care for First Nations children up to internationally acceptable levels. The reality is that:

> The average Canadian gets services from federal, provincial and municipal governments at an amount that is almost two-and-a-half times greater than that received by First Nations citizens. [4]

> Adding additional resources and providing flexibility in funding to ensure our most vulnerable are provided with the services they require should not be barred due to fiscal concerns. As pointed out by British Columbia's former Children's Commissioner:

> The federal and provincial governments and bands do not yet share a clear vision of how best to meet the needs of Aboriginal children on and off reserve…. in the meantime funding formulas and lack of clarity about roles and responsibilities, continue to place Aboriginal children at risk on reserves. **Only when communities are given adequate resources for health, education and child welfare supports will we see healthier and safer Aboriginal children… This must be top priority of all governments and child serving agencies in the years to come.** [5] [*emphasis added*]

1. Federal/Provincial Jurisdiction

Compared with other jurisdictions, services and infrastructure provided on reserve are substandard by almost every measurable outcome. No government appears to want to be accountable for this. At present, reserves are so under-financed that virtually every dollar received must be used to meet pressing social needs.[6]

The federal/provincial/territorial "dispute" can be summarised as follows. The federal government's position is that the provincial government has constitutional authority, pursuant to section 92 of the *Constitution Act, 1867*[7] for the delivery of child and family services under the headings "property and civil rights" and "all matters of a local or private nature". The federal government funds on-reserve child and family service agencies pursuant to a policy directive (20.1) – not, according to them, as a result of a fiduciary obligation but as a matter of administration. Steadfast in their claims, the federal Government asserts that their provision of programs and services to First Nations, whether on or off reserve, is discretionary.[8] Specifically the Department of Indian and Northern Affairs (DIAND) has stated that:

> DIAND's perspective is that provinces delegate authority to agencies and are thus responsible to ensure that the agency operates pursuant to the established standards. Where deficiencies are observed it is the role of the province, as the substantive legislative

> authority for Child and Family Services, to work with the agency to address the needed improvements. The department's role is limited to funding the provision of services delivered by agencies authorised by the province. [9]

The provincial government contends that the federal government is responsible for "Indians" on reserve pursuant to section 91(24) of the *Constitution Act*, which they argue includes the delivery of child welfare services to ""Indians"". The provincial and territorial governments have expressed concern regarding the federal off-loading of responsibility for Aboriginal peoples and argue:

> …that the federal government has a constitutional, historical, fiduciary and Treaty responsibility for/and to Aboriginal peoples, both on reserve and off. [10]

The lack of services, opportunities and deplorable living conditions characterizing many of Canada's reserves has led to mass urbanization of Aboriginal peoples. The provinces claim that federally imposed limitations on the provision of services on reserve has led to urbanization and has transferred the "economic and social costs of inadequate on-reserve conditions to other levels of government".[11] Some provincial governments point out that as far back as the *Penner Report*[12] it was recognized that the federal government remains responsible for Aboriginal peoples living off-reserve and rights to special federal programs must be accorded to those living both on and off reserve. However, 22 years later there continues to be a lack of clarity and, as articulated in a Provincial/Territorial options paper:

- Aboriginal peoples and the provincial and territorial governments regard the federal government as responsible.
- Aboriginal peoples suffer from the lack of clear and consistent federal responsibility and accountability.
- The federal government's practice of withdrawing funding has meant reductions in services for Aboriginal peoples and increasing costs for provincial and territorial governments.[13]

The position of First Nations is set out clearly in the following guiding principle, endorsed by resolution, by the Chiefs in Assembly:

> The federal government must maintain its trust responsibility and fiduciary obligation to First Nations including, child, family and community services.[14]

Chiefs have drawn a link between the federal government's fiduciary responsibility to ""Indians"" and their financial responsibility:

> An issue clearly linked to funding is the fiduciary responsibilities of the federal government toward the First Nations.[15]

The responsibility of the Federal government has been argued at various times from a constitutional, treaty and fiduciary standpoint. [16] Similar to the argument put forth by the provinces, First Nations have asserted that the federal government's obligation to provide adequate funding for child welfare arises from ss. 91(24) and 35 of the *Constitution*; and that the federal government's fiduciary responsibility extends to child welfare and obliges the federal government to ensure the well-being and health of First Nations children.

With regard to s.35, the federal government argues that the right to funding for child welfare services is not an aboriginal right protected under s.35 and therefore the fiduciary relationship is not engaged. The possibility of a fiduciary obligation will be discussed further in relation to case law. Treaty arguments have likewise been rejected by the federal government. Unfortunately treaties have not been clear as to specific obligations in the area of social programs and services and therefore the dispute is left to differences of interpretation.[17] Although First Nations maintain that child welfare is a treaty right this ambiguity would make litigation, on this basis, difficult.

a) Funding

First Nations have made a direct connection between the state of children's health and the colonization and attempted assimilation of Aboriginal peoples:

- The legacy of dependency, cultural and language impotence, dispossession and helplessness created by residential schools and **poorly thought out federal policies** continue to have a lasting effect.
- Substandard infrastructure and **services have been made worse by federal-provincial disagreements over responsibility.**[18] [*emphasis added*]

The most profound impact of the lack of clarity relating to jurisdiction results in what many commentators have suggested are gaps in services and funding –resulting in the suffering of First Nations children. As articulated by McDonald and Ladd in their comprehensive Joint Policy Review (prepared for the Assembly of First Nations and DIAND):

> First Nations agencies are expected through their delegation of authority from the provinces, the expectation of their communities, and by DIAND, to provide a comparable range of services on reserve with the funding they receive through Directive 20.1. The formula, however, provides the same level of funding to agencies regardless of how broad, intense or costly, the range of services is. [19]

This is further underscored in the recent Manitoba Aboriginal Justice Implementation Commission, which summarised a number of problems inherent with the delivery of First Nations child and family service delivery, notably [from the relevant literature]:

> Aboriginal agencies have had to operate with inadequate financial resources even when compared to non-Aboriginal agencies. They have had to do more with less money. This has meant that essential services have consumed the bulk of available resources and that other areas such as prevention and public education have received a low priority. In addition some Aboriginal agencies have experienced serious backlogs in key program areas such as foster and adoption placements.[20]

The federal funding formula provides for two categories of funding; operations and maintenance. Agencies receive operations funds based on the number of children within the agency's jurisdiction. Alternatively, maintenance funds are intended to cover the cost of maintenance for each child. These funds, however, are only provided for **children in care**. Small agencies, therefore, have difficulty finding funding for family assistance or prevention services. The result is that children have been placed in care simply to receive funding. [21]

A comment that was consistently repeated by First Nations Child and Family Service [FNCFS] providers and highlighted by the National Policy Review is the lack of focus, within the current funding formula, on the diverse needs of FNCFS agencies. An example of where this creates great difficulty is with FNCFS agencies located in rural locations. Service providers in these agencies are required to do a great deal of travelling, however, travel costs are only provided for **children in care**. Therefore, small agencies receiving minimal operational funds are hard pressed to cover travel costs needed to visit families who require assistance to ensure the continued health and safety of their children.

These comments are directly related to the most common issue that has been raised in regard to the funding of FNCFS agencies, the lack of funding for preventative services. Despite the fact that preventative services are provided for in most provincial child and family statutes, under which mandated FNCFS agencies operate, they are not funded adequately by Indian and Northern Affairs Canada [INAC]. For example, a FN agency key informant, noted that ss.5 and 14 of the *Child and Family Services Act* [22] provide for family services to enable agencies to assist families and keep children with their parents. However, FNCFS agencies in Saskatchewan are unable to provide these legislatively mandated services due to the removal of funding for preventative care.

These difficulties are felt in most provinces, however, the unfortunate result of having to place children in care in order to receive funding is further complicated in some provinces where the funded care options are limited. For example, B.C.'s *Child, Family and Community Services Act*[23] provides for numerous out of care options such as kith and kin agreements, assisted adoption and transfer of custody. These options, however, are not funded under directive 20-1 and therefore Aboriginal children may be denied options which are provided to other non-Aboriginal children or off-reserve. As pointed out by a First Nations agency director:

> Flexible funding does provide for agencies to meet the criteria to fund children in these types of placements [out of care]. However, the formula is still based on numbers of children in care and the fear is that at the end of the 5 year block there could be significant cuts to funding if children have been placed through an out of care option. [24]

The result is that agencies are forced to effectively ignore the best interests of the child in order to ensure continued funding.

A similar situation exists in Saskatchewan where recent amendments to *The Child and Family Services Act* [25] have been introduced to ensure that the first placement option is with the child's extended family or friends. The funding formula, however, does not allow FNCFS to fully implement these options in First Nations communities. [26] Therefore, children under the care of a FNCFS agency are not given the same level of service as children under provincial jurisdiction.

The difficult decisions made by agencies in order to ensure continued funding are further exacerbated by the fact that agencies must maintain both provincial and their own Nation's standards. An informant commented on the absurdity of criteria put in place by INAC.[27] For instance, one Aboriginal child and family service agency reports that INAC advised them that they would only be funded for one hour of service per child. The agency currently employs two social workers, each of whom carry approximately 65 files, more than doubling the provincial standard of 24. These social workers frequently travel long distances to visit clients, making it impossible to maintain a one hour per child standard.

Moreover, the informant pointed out that the agencies not only have to meet provincial standards to ensure continued operation, but also the standards of their own communities. She stated that often these community standards are far stricter than those of the provinces or the federal government and require a level of attention to the best interests of the child physically, spiritually and culturally that is often not possible due to the funding limitations. This issue was also raised by a review panel, established to inquire into services provided to an Aboriginal infant in Saskatchewan.[28] In their report, the panel noted that:

> …FNCFS agencies are expected to provide services according to Provincial legislation and program standards with funding criteria that does not recognize all of the provisions in the *The Child and Family Services Act* or its accompanying program standards. [29]

In addition, in her report on the funding of FNCFS agencies, Elsie Flette notes that:

> The requirement to use provincial/territorial child welfare statutes poses a significant challenge for First Nation agencies which must try to adapt to expectations of First Nation governments whose services reflect the holistic, interdependent and communal rights framework of the cultural communities they serve with the individual rights based child welfare statutes. [30]

A final issue that was repeated by service providers is the lack of funding for legal services. Approximately two years ago the federal government halted payment of legal fees under maintenance funding.[31] Therefore, small agencies with limited operational funds are again forced to either deny service or transfer cases to other jurisdictions. In either scenario, costs are likely to be offloaded to the province and children are moved from agency to agency and social worker to social worker with their best interests lost in fiscal conservatism.

The issues raised by FNCFS providers demonstrate the tangible effects of funding limitations on the ability of agencies to address the needs of children. Without funding for provision of preventative services many children are not given the service they require or are unnecessarily removed from their homes and families. In some provinces the option of removal is even more drastic as children are not funded if placed in the care of family members. The limitations placed on agencies quite clearly jeopardize the well-being of their clients, Aboriginal children and families. As a society we have become increasingly aware of the social devastation of First Nations communities and have discussed at length the importance of healing and cultural revitalization. Despite this knowledge, however, we maintain policies which perpetuate the suffering of First Nations communities and greatly disadvantage the ability of the next generation to effect the necessary change.

2. Case Law Review

There is a paucity of case law specifically on the issue of jurisdiction and child and family services, and very little on jurisdiction generally, *vis-a-vis* social service delivery. No case law was found challenging various inter-ministerial (federal departments) jurisdictional responsibilities.

A review of the case law is set out below beginning with a discussion of federal/provincial jurisdictional issues and fiduciary responsibility. In addition a review of section 35 of the *Constitution*, section 15 and 7 of the *Charter* and international law is provided.

In summary the state of the law is uncertain. Although there are strong arguments to be made, no decisions have yet been rendered on the obligations of the Crown to provide adequate and equal funding for child welfare, as either a constitutional or fiduciary obligation.

a) Federal/Provincial

In a 1997 decision the Manitoba Queens Bench cast doubt on the argument that Canada's decision to unilaterally discontinue discretionary funding for preventative services was a breach of their fiduciary obligation. In his judgement, MacInnes J. stated that:

> In my view, there is nothing that obligates Canada to provide services to family funding. There is no aboriginal or treaty right which so provides. While clearly there is a fiduciary relationship between Canada and aboriginal people which creates certain obligations upon Canada with respect to Indian children and families, this fiduciary relationship does not obligate Canada to pay any specific amount of funding for any specific purposes. [32]

MacInnes J.'s decision in *Southeast* suggests that although there is a general fiduciary relationship between the federal government and Aboriginal peoples [children] it is unlikely that this relationship equates to a fiduciary duty to provide funding for child welfare services. The scope of the Crown's fiduciary obligation in relation to its dealings with First Nations is a relatively new area of law and therefore it is difficult to assess the probability of success with this type of argument. However, the following provides a brief discussion of recent case law with regard to the Crown's fiduciary duty.

In *Wewaykum Indian Band v. Canada*[33], Binnie J., for the court, held that the fiduciary duty is not a general concept and doesn't cover all aspects of the fiduciary relationship[34]. Therefore, not all dealings between parties to a fiduciary relationship will give rise to a fiduciary obligation.

> It is necessary then to focus on the particular obligation or interest that is the subject matter of the particular dispute and whether or not the Crown had assumed discretionary control in relation thereto, sufficient to ground a fiduciary obligation. [35]

The courts have repeatedly stated that a fiduciary duty will not generally attach to a public law duty. In *Squamish Indian Band v. Canada* [36] the court held that in matters of public law the Crown is not acting with the benefit of one party in mind, therefore, Crown discretion and vulnerability of those to whom the Crown maintains a fiduciary relationship can exist "without triggering a

fiduciary standard"[37]. Similarly in *Guerin v. Canada*[38] Dickson C.J. stated that:

> Public law duties, the performance of which requires the exercise of discretion, do not typically give rise to a fiduciary relationship. The Crown is not normally viewed as a fiduciary in the exercise of its legislative or administrative function.[39]

However, it was further noted by Binnie J. in *Wewaykum* that a public law duty does not necessarily negate the possibility of a fiduciary relationship.

> The latter depends on identification of a cognizable Indian interest and the Crown's undertaking of discretionary control in relation thereto in a way that invokes responsibility "in the nature of a private law duty." [40]

Moreover, Binnie J. held that the fiduciary duty:

> …where it exists, is called into existence to facilitate supervision of the high degree of discretionary control gradually assumed by the Crown over the lives of Aboriginal peoples. [41]

Finally, in *R. v. Adams*[42], Lamer C.J. for the majority, warned against the implementation of "unstructured discretionary administrative regimes" [43] and stated:

> In light of the Crown's fiduciary obligations towards Aboriginal peoples Parliament may not simply adopt an unstructured discretionary administrative regime which risks infringing aboriginal rights in a substantial number of applications in the absence of some explicit guidance.[44]

Therefore, the existence of a fiduciary duty seems to hinge on the type of interest in question and whether due to the sui generis nature of the relationship between the Crown and Aboriginal peoples, a traditional public law duty will be subject to a fiduciary duty. An example of where a fiduciary obligation was found to exist in what would generally be deemed a public law area is provided by the Ontario Court of Appeal in *Bonaparte v. Canada (Attorney General)*.[45] The court held that the federal government, in implementing residential school policy, "assumed a duty to act in a fiduciary capacity with respect to the education of Aboriginal peoples." [46]

The appellants in *Bonaparte* were the descendants of residential school survivors and claimed that they had been denied transmission of their culture and "the opportunity to achieve a full and normal family, social and economic life" [47] due to the imposition of the residential school system. Unfortunately, the issue of whether the fiduciary duty had been breached was not decided at either the trial or appeal level. The claim was struck out at the trial level on the grounds that descendants of victims are not owed a fiduciary duty and although the court of appeal ruled that this was an error, the primary issue of breach was not decided.

Nonetheless, the fact that a fiduciary obligation was found to exist in relation to the administration of education significantly strengthens the argument that the same obligation should be extended to other social services, such as child welfare.

With regard to the obligation of the provincial government to step in and provide services, where federal funding is lacking, a Manitoba Provincial Court Judge held that the province has a legal obligation to ensure that First Nations have comparable services to those off-reserve:

> … irrespective of any views, that the provincial government may have as to the historical, political, financial or moral responsibility of the federal government to provincial health and social care, it is now absolutely clear that it is the legal responsibility and duty of the province to supply child welfare services in accordance with the *Child Welfare Act* [48]

In some cases provinces have provided piece-meal funding. For instance in B.C. the Squamish First Nation was provided with funding for a cultural worker. This was done after the Nation brought a complaint to the former Children's Tribunal alleging that Squamish children were being denied their right to receive guidance and encouragement to maintain their cultural heritage pursuant to section 70 of the *British Columbia Child, Family and*

Community Services Act. They argued, successfully, that the federal funding, pursuant to Directive 20.1, was inadequate to comply with the changes to the provincial legislation (specifically s. 70 – rights of children in care).

Unfortunately, the law remains unclear. The *Director of Manitoba v. B* was decided by a lower court, never appealed, and is now almost 25 years old. Much has changed since then (and much has stayed the same). Moreover, there has yet to be a clear decision on whether the Crown could be held to a fiduciary obligation to provide child welfare services. *Southeast* was unsuccessful on appeal and the primary issue, regarding the existence of a fiduciary obligation to provide funding for preventative services, has yet to be argued. Therefore in the absence of any further judicial inquiries, the state of the law is as set out in *Southeast* – in short, the jurisdictional conundrum continues.

b) Section 35

Aboriginal peoples have been recognised in *Constitution Act, 1982,*[49] pursuant to section 35, which reads as follows:

> *s. 35 (1) The existing aboriginal and treaty rights of the aboriginal peoples of Canada are hereby recognised and affirmed.*

Case law to date has not recognised the governance of child and family services as an Aboriginal right. For example, a lower court in British Columbia found that section 35 did not include the right to govern child and family services, in *Re Child and Family Services Act of B.C.*:

> Within any society there can be only one source of ultimate power or authority. Within modern democracies that is the properly constituted government. The right to determine if children are abandoned, or neglected or abused to the extent of being in need of protection, and the power to implement the appropriate remedies is an authority vested in every viable society. It is not something exclusive to aboriginal in general or to aboriginal of Canada in particular. Being a feature common to all

> viable societies, I am satisfied it is not an aboriginal right as referred to in section 35 of *Constitution Act*, 1982[50]

In contrast, the B.C. Court of Appeal held in *Casimel*,[51] that customary adoption is a right protected by section 35 of the *Constitution*. Thus embracing the notion that the traditional practices of caring for children by extended family and other community members is an inherent right. By analogy, and logical extension, section 35 should apply to First Nations child and family services. If accepted as a right under s.35, the case law would suggest that a fiduciary duty argument would be significantly strengthened and it could be argued that the federal government has a fiduciary responsibility to ensure that the right is not extinguished by provincial laws of general application.

c) Charter

The Canadian *Charter of Rights and Freedoms* outlines, in section 15, that:

> *Every individual is equal before and under the law and has the right to the equal protection and benefit of the law without discrimination and, in particular, without discrimination based on race, national or ethnic origin, colour, religion, sex, age or mental or physical disability.*

The provincial and federal government's jurisdictional debate could be characterised as a shirking of responsibilities that amounts to inequitable treatment of First Nations and is therefore in violation of section 15 of the *Charter*. Arguably child protection laws are applied differently on reserve (due to lack of adequate

funding) than off which constitutes inequitable treatment based on race and residence. On its face, this amounts to a denial of equality before the law (equality of application) and equal benefit (unequal provision of generally available services). The Supreme Court of Canada held in *Eldridge v. British Columbia* [52] that once a state provides a benefit, it must do so in a non-discriminatory manner, and must take special measures to ensure that disadvantaged groups are able to benefit equally from government services.

In *Corbiere*[53], the Supreme Court of Canada unanimously held that "Aboriginality-residence" is an analogous ground of discrimination under s.15[54]. McLachlin and Bastarache JJ., for the majority, held that distinctions based on reserve residency touch on personal, immutable characteristics and are therefore automatically suspect of being discriminatory. The reasoning of the court was based on the fact that living on or off reserve may not involve choice for many, and for others is a very personal decision.

> The ordinary "residence" decisions faced by the average Canadians should not be confused with the profound decisions Aboriginal band members make to live on or off their reserves, assuming choice is possible. The reality of their situation is unique and complex.

An alternative argument is that the inequalities in child welfare funding are based on race. This argument is bolstered by the fact that services are not only unavailable on reserve but may also be denied off reserve due to jurisdictional disputes. Therefore, a government argument based on the proposition that the inequality arises out of the difficulty of providing and funding services in remote communities [on-reserve] would be unconvincing. The lack of services off-reserve or the unwillingness of the federal government to provide for services off-reserve, lends credibility to the argument that the inequality is based on race (as well as residence).

It may also be argued that the lack of adequate funding and resources on reserve constitutes a breach of s.7 of the *Charter*. s. 7 provides that:

> *Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice.*

The lack of adequate funding and resources on-reserve has led to the placement of children in care and removal of children from reserves. It could be asserted that this is a clear infringement of children's right to liberty in relation to the ability to remain in their homes and communities. In *Godbout v. Longueuil*, La Forest J. held that:

> …the autonomy protected by the s. 7 right to liberty encompasses only those matters that can properly be characterized as fundamentally or inherently personal such that, by their very nature, they implicate basic choices going to the core of what it means to enjoy individual dignity and independence… choosing where to establish one's home is, likewise, a quintessentially private decision going to the very heart of personal or individual autonomy. [57]

Although the liberty to choose where one resides is clearly not an inalienable right, it may be considered a strong argument that children should only be forced to leave their family homes in the most extreme circumstances. This is not the case here as Aboriginal children are removed from their homes in far greater numbers than non-Aboriginal children for the purposes of receiving services.

Alternatively, it may be argued that placement of children in care, due to lack of services, amounts to an infringement of the parent's right to security of the person, under s.7. According to the Supreme Court of Canada in *New Brunswick v. G.(J.)* [58] the right to security of the person encompasses psychological integrity and may be infringed by state action which causes significant emotional distress. Moreover, it was held that the loss of a child constitutes the kind of psychological harm which may found a claim for breach of s.7. Lamer J., for the majority, held:

> I have little doubt that state removal of a child from parental custody pursuant to the state's parens patriae jurisdiction constitutes a serious interference with the psychological

> integrity of the parent…As an individual's status as a parent is often fundamental to personal identity, the stigma and distress resulting from a loss of parental status is a particularly serious consequence of the state's conduct.[59]

The court went on to state that there are circumstances where loss of a child will not found a prima facie breach of s.7, including when a child is sent to prison or conscripted into the army. [60] Clearly, these circumstances can be distinguished from the removal of a child from his/her home due to the government's failure to provide adequate funding and services.

The federal funding formula, directive 20-1, impacts a very vulnerable segment of our society, Aboriginal children. The protection of these children from state action, infringing on their most fundamental rights and freedoms, is clearly in line with the spirit of ss.7 and 15 of the Charter. Research conducted on the issue of child welfare plainly shows differentiation in the quality of services provided on and off reserve and to aboriginal and non-aboriginal children. This type of differentiation is unacceptable in a society that prides itself on protection of the vulnerable.

d) International

In 1990, Canada signed on, as a signatory, to the United Nations *Convention on the Rights of the Child* [61]. The Convention sets out the rights of children and the corresponding responsibilities of state governments. In particular, the *Convention* includes:

> Article 23 – Right of a child with a disability to special care and assistance – ***which may be violated due to lack of funding as a result of jurisdictional issues.***
>
> Article 24 – Right to highest attainable standard of health – ***which may be violated due to lack of funding as a result of jurisdictional issues.***

As a means to honour the *Convention*, Canada has set out an "Action Plan" in response to the 2002 United Nations Special Session on Children. Canada's Action Plan commits to the following:

> No. 44: The Government of Canada is working together with Aboriginal communities, leaders and Elders, as well as provincial and territorial governments **to improve the health and well-being of Aboriginal children and their families**.
>
> No. 83: **Canadians believe that children with disabilities should have equality of access to programs and services** that allow them to reach their full potential and participate as they wish in society… [*emphasis added*]

Arguably, in light of the continued "jurisdictional disputes" Canada is in breach of their international obligations, pursuant to the *Covenant*, in particular Articles 23 and 24. Canada's commitments in their Action Plan (especially 44 and 83) are compromised by the continued failure of all governments to effect adequate dispute mechanisms that would place First Nations children at the centre of the 'dispute', as opposed to "falling through the cracks" because of gaps in services created by the continuing lack of clarity. Although the Convention does not contain any specific remedies for a breach of the Convention – International attention regarding continued violation of the convention would not be looked favourably upon by the international community.

3. Inter-Jurisdictional

> *Despite persistent pleas from Aboriginal people that their interdependent needs be served by holistic services, the service environment continues to be fragmented between federal and provincial levels of government, between departments and ministries, and among service agencies in community.* [63]

The vision document *A National Children's Agenda: Developing a Shared Vision* sets out four goals for a National Children's Agenda:

- Healthy physically and emotionally,
- Safe and secure,
- Successful at learning, and
- Socially engaged and responsible.[64]

Aboriginal children fair poorly in meeting any of the goals presented in the National Children's Agenda (or Canada's Action Plan). As discussed previously (above) and reiterated in a report on *The National Child Benefit*[65] many Aboriginal children live in poverty and suffer because of the lack of clarity around jurisdictional roles and responsibilities not only of the of the Federal/Provincial/Territorial governments, but also between ministries/departments (inter-jurisdictional):

> Another barrier to the provision of holistic services is the lack of integration between government departments, programs and agencies. Communities that are trying to develop new strategies are overwhelmed and frustrated by having to deal with far too many different government departments. Others indicated that there was more rhetoric than reality about partnership building. [66]

The Aboriginal Nurses Association of Canada poignantly illustrate how this impacts on their work with Aboriginal people:

> Aboriginal nurses see the jurisdictional problems between the federal, provincial/territorial, and First Nations governments and agencies from a clients perspective. They spend many hours attempting to explain the complexity and the relevant policies and procedures to clients and their family members that require access to the wide array of programs and services offered at the various levels of government and non-government agencies.

Following is a specific example of problems that arise for children with special needs/disabilities.

a) Children with Disabilities/Special Needs

> Aboriginal people receive health services through a unique combination of federal, provincial and Aboriginal-run services, as well as other programs and services. Responsibility for delivery of health care to Aboriginal people in Canada has been the subject of considerable debate regarding jurisdictional responsibility. For many years, the lack of co-ordination between various levels of government and Aboriginal community agencies has resulted in fragmented services or a lack of services for Aboriginal people… Historically the federal government of Canada has recognised that a special relationship exists between it and Status "Indians" with respect to the provision of health care. However this responsibility is largely defined as a matter of policy and goodwill and is not considered by the courts to be a legal obligation.[68]

The Assembly of First Nations, in a recent newsletter, highlighted the circumstances of the case of four year old Jordan, a First Nations boy in Winnipeg as a poignant and sad example of how First Nations children fall through the cracks as a result of federal/provincial/territorial and inter-ministerial jurisdictional squabbles.[69] Jordan was removed from his home at birth and placed in hospital under the care of a FNCFS agency. The agency developed a plan to place the child in a foster home with the necessary support for his medical condition. However, implementation of the plan has been impossible, as INAC, Health Canada and the provincial government are not willing to take responsibility for the costs involved in moving the child from hospital. The newsletter states:

> *This is unnecessary. This situation is unacceptable and it is a violation of this child's basic human rights. Every child has the right to be raised in a family, to have their needs met and to receive quality care. And sadly, this young boy is only one example.*[70]

As the article points out, Jordan's experience is but one example. According to statistics:

> Almost one-third of Aboriginal Canadians age 15 and over reported having a disability in 1991 – more than double the national rate (15%). The difference was particularly pronounced among younger age groups, where Aboriginal people were three times as likely to have a disability. [71]

A key informant offered numerous examples of children with complex medical needs, suffering on-reserve due to the lack of resources. However, she/he quickly noted that those who are transferred

off reserve, for provision of services, do not have a much brighter future. Children who are removed from their homes are primarily transferred to hospitals and institutions where it is cheaper to meet their needs. Therefore, due to jurisdictional disputes, Aboriginal children with special medical needs are not only taken out of their own homes but are rarely ever offered the chance to once again live in a family environment.[72]

She/he also noted that INAC recently discontinued the funding of travel costs for parents to visit their children in hospital. Although INAC still covers the cost of travel for a child to return home for a visit, due their unique medical needs, these children are generally not able to travel. [73] Therefore, in light of the poverty suffered by many of the families involved with child welfare system, INAC's policy essentially keeps these families from maintaining contact.

Inadequate funding and poor inter-jurisdictional cooperation has resulted in a situation where children with complex medical needs are either left to suffer on reserve, without the proper resources, or alternatively are institutionalized with little likelihood of ever having the opportunity to live in a home environment. Surely neither of these options can be seen to be in the best interests of the child.

Great concern has also arisen in relation to children who have special medical and emotional needs but do not require the type of equipment and resources as those who are institutionalized, for example, children with FAS/FAE. Unfortunately, these concerns have largely been brought to public attention through extensive inquests into the circumstances of the deaths of children in care.

Two recent inquests out of Manitoba underscore the impact of inadequate funding and the lack of cooperation and communication between the different levels of government and agencies.[74] Both children, Patrick Norman Redhead and Susan Redhead (unrelated), committed suicide by hanging after being bounced from home to home and institution to institution. Both children had emotional and behavioural issues that were left unaddressed and likely suffered from FAS/FAE although neither was ever officially diagnosed.

The inquest into the death of Patrick Norman Redhead was held by Provincial Court Justice Geisbrecht and lasted over thirty days. A number of recommendations were produced in regard to the care of children with special needs. Giesbrecht J. particularly noted that jurisdictional issues have resulted in children being "moved or pushed from one agency to another for purely economic reasons"[75] resulting in a disconnect between the needs of the child and what occurs due to fiscal restraints. Moreover, Geisbrecht J. focused a great deal on the impact of the virtual absence of funding for preventative programming:

> It is self-evident in my view that at this time existing resources cannot be diverted from the high-needs children who are currently in the system. . . At the same time if funding at the front end of the system is not increased, if we do not become proactive rather than reactive than we are simply creating greater and ultimately much more expensive problems down the road.[76]

In her testimony before the Inquest, Janet Mirwaldt, Manitoba Child Advocate, discussed the possibility of a multi-disciplinary approach to provide adequate services for high-needs children. In commenting on the policies of avoidance, practiced by both the federal and provincial governments, she stated:

> Even in a world of limited resources the narrow approach should be avoided…More resources might be found, not by creating new resources but by sharing existing resources…Resources can be developed interdepartmentally within those limited resources.[77]

The recommendations set out by Geisbrecht J. in relation to resource and funding issues are reproduced in Section IV, of this report.

The inquests of both Patrick Redhead and Susan Redhead paid additional attention to the lack of training for service and foster care providers regarding the needs of children with FAS/FAE. Again this was linked to a lack of funding for preventative services and programs.

Recommendations for improvement in training are also reproduced later in this report.

This, therefore, raises a systemic issue that arguably has not, but must be, addressed:

> Lack of disability-related services available on-reserve often forces Aboriginal peoples to abandon their communities in search of supports. Once off-reserve, Aboriginal peoples face jurisdictional barriers in accessing these supports and services. This sub-committee also heard that many Aboriginal children with disabilities are placed in child welfare services in order to access supports which are not available to their biological families.[78]

A similar refrain was articulated, on March 30, 2001, by the Social Services Ministers, who released *In Unison 2000: Persons with Disabilities in Canada*[79]. This paper included input from Aboriginal peoples and provided a profile of Aboriginal Canadians with disabilities. One of the main concerns raised regarding Aboriginal peoples, was the jurisdictional debate/conundrum that enters almost any discussion about Aboriginal peoples (children) and social policy:

> The lack of disability-related services available on reserve often forces Aboriginal peoples to abandon their communities in search of these supports; however, once off-reserve, Aboriginal peoples with disabilities face jurisdictional barriers in accessing these supports and services. [80]

The report outlined actions to be taken which included the establishment of an Aboriginal Technical Committee on Social Policy.

Finally, Commissioner Roy Romanow, in his *Interim Report* on health care in Canada, underscored that the responsibility for Aboriginal health and health care programs demands resolution.

> … is an area surrounded by uncertainties that have had serious consequences to the health and health care of Aboriginal peoples. [read children] [81]

This issue is currently under review by both Health Canada and INAC. According to an informant from the First Nations and Inuit Health Branch, the two federal departments are in discussions regarding who will fund the necessary services for Aboriginal children with complex medical needs. She/he acknowledged that there was significant concern in regard to the gaps in service for these children and the consequences of ongoing jurisdictional disputes.

Another informant agreed that the present situation is intolerable. However, she/he stated that the current situation is due primarily to Health Canada's refusal to cover the medical costs of children in care under non-insured health benefits. She/he stated that Health Canada has signed numerous agreements with various FNCFS agencies promising to provide funding for children with special medical needs. She/he stated that these agreements have rarely been upheld and Health Canada has cited interpretational misunderstandings as the reason to pull out of agreements. The existence of these agreements was not confirmed by Health Canada.

While the discussions are ongoing between federal departments some provinces are taking independent action. For example, Alberta has recently enacted new legislation, *The Family Support for Children With Disabilities Act*[82], which extends services to children with disabilities on reserve. Unfortunately, it seems that most First Nations children will be unable to take advantage of this program. As pointed out by an informant, the new legislation consists of a reimbursement program and the majority of First Nations families on reserve will be unable to pay for services upfront[83]. Therefore, the same situation arises where families are forced to put their children into care in order to ensure funding.

4. SUFA

The Social Union Framework Agreement (SUFA) was entered into, in 1999, between the Federal/Provincial/Territorial governments. SUFA sets out some broad principles for a new era of social policy and co-operation in the areas of health, children, post-secondary education and other social programs. In particular the agreement

is aimed at enabling the Federal/Provincial/Territorial governments to work together:

> … and with Canadians, to strengthen our health care system, eliminate barriers to mobility for Canadians, involve Canadians in the development of social programs, and strengthen partnership among governments.[84]

The general principles outlined in the agreement, to guide social programs for Canadians, were identified as:

- Equality of opportunity;
- Access to all Canadians to comparable programs;
- Medicare principles;
- Help for those in need.[85]

The government of Quebec did not sign the agreement, nor were Aboriginal peoples included as signatories to the agreement. National Chief of the Assembly of First Nations, Chief Phil Fontaine, prior to the signing of SUFA, recommended the inclusion of First Nations as full and equal partners in the Social Union process and urged the Prime Minister to "enfold the First Peoples of Canada in this historic process of nation-building" [86]. Yet leaders from National Aboriginal Organisations (NAO's) were not direct parties to the negotiations.[87] Fontaine underscored the importance of Aboriginal involvement in light of the unique relationship of First Nations with the federal government and the fact that:

> Social Union reform directly affects the **jurisdictions** of First Nations' governments, the current and future relationships between First Nations and the federal and provincial/territorial governments **and the nature and quality of social programs** available to First Nations citizens. [88] *[emphasis added]*

SUFA does, however, include a provision which states that:

> Governments will work with the Aboriginal peoples of Canada to find practical solutions to address their pressing needs.[89]

Although the SUFA agreement acknowledges Aboriginal peoples it does not, by implication, recognise them as contemporaries to the other signatories. One commentator has suggested that the exclusion of Aboriginal peoples as signatories would suggest:

> … that they are analogous to municipal governments, which are also bystanders to the SUFA process. This could be seen as a further retreat from the 1992 high-water mark of Aboriginal influence, when the text of the Charlottetown Accord wove a significant Aboriginal presence into virtually every institutional warp and woof of the Canadian federal state.[90]

Unfortunately, the rationale provided to justify Aboriginal exclusion was, as identified by Prince, a Professor at the University of Victoria, because the agreement dealt with "administrative matters":

> The reasons given for the exclusion of Aboriginal national leaders were that the talks involved administrative arrangements, not constitutional proposals, and that the delivery of social programs continues to be a provincial responsibility.[91]

First Nations are, unfortunately, all too aware of the fact that because of jurisdictional issues, and other matters of pressing urgency, SUFA represented not merely the negotiation of "administrative arrangements" but enfolded discussions regarding matters that relate to their very survival – access to social programs i.e. especially with regards children and youth.

Furthermore, Professor Margot Young argues that the text of SUFA seems to support a notion of formal rather than substantive equality. [92]As illustrated by Young, substantive equality takes into account individual or group differences in recognition of the fact that "same treatment is not always equal treatment"[93]. This is of special concern for Aboriginal people [read children] who are historically disadvantaged because of their race and often times due to their place of residence. As Young points out, the difference between models of substantive and formal equality can be very important:

> Without consideration of individual's real social and economic conditions and absent program design that addresses systemic

> inequalities, state action will do little to effect substantive amelioration of the pre-existing conditions of deprivation and disadvantage that currently deny social citizenship to large groups of Canadians.[94]

One of the areas highlighted in the SUFA agreement is "Funding Predictability". This section is meant to provide direction for the funding relationship between the Federal/Provincial/Territorial governments - but has obvious far-reaching implications for Aboriginal peoples. Jurisdictional "issues", have yet to be reconciled and clearly affects "funding predictability". Aboriginal peoples survive, in many cases, on piece-meal or inadequate funding for necessary social services. SUFA does nothing to address this far-reaching problem in particular with Aboriginal peoples. One of the goals of SUFA should be funding predictability for Aboriginal peoples, Aboriginal Nations, governments, and National Aboriginal representative groups.

In a Treasury Board, SUFA analysis of the First Nations Child and Family Services programs they note that there are no "residency-based barriers in this program"[95]. Furthermore, the Social Union web-site notes that:

> There was a broad consensus between the signatory governments that the first priorities should be children in poverty and persons with disabilities[96].

Clearly there are residence-based barriers and clearly if the first priority of the SUFA signatories is children living in poverty and people with disabilities – issues affecting access to services for First Nations children with special needs/disabilities must be given the greatest priority.

5. Summary

Jurisdictional issues remain the subject of lively debate. Case law does not provide much guidance in clarifying the issue. Complicating the "debate" are the jurisdictional issues that manifest inter-ministerially, in addition to the federal/provincial/territorial conundrum.

One avenue that could have ameliorated and potentially have assisted stakeholders would have been the inclusion of First Nations as full and equal partners in the negotiation, signing, and discussions of SUFA.

In the interim, as a result of the lack of clarity in the law and policy it is important that dispute mechanisms be designed to ensure that First Nations children are provided with the services that best meet their needs and that Canada has committed to providing in order to meet their international obligations pursuant to the *Convention on the Rights of the Child*.

Following is an examination of dispute mechanisms.

III. DISPUTE MECHANISMS

> *No. 18: Under Canada's Constitution, federal, provincial and territorial governments are responsible for many areas that touch on the lives of children. It is clear that if children are to benefit co-operation among jurisdictions is essential. Federal, provincial and territorial co-operation with respect to children has been significantly enhanced over the past decade…*[97]

McDonald and Ladd, in their comprehensive policy review of First Nations Child and Family Services provide an overview of Dispute Mechanisms as of March 31, 2000, which set out arrangements to resolve differences in interpretation and legislation and standards between provinces, DIAND, and First Nations Child and Family Services (FNCFS). As McDonald and Ladd point out, in nearly all cases there are no formal mechanisms in place resulting in informal methods being deployed to address various contentious issues. This was identified in 1995 by INAC, despite the fact that Directive 20.1 requires the establishment of tri-partite panels/committees:

All regions have created tripartite mechanisms, though not always a formal panel or committee. These mechanisms have been useful, but their effectiveness tends to depend on the relationship developed between the parties and their intended purpose.

McDonald and Ladd proposed the following recommendation:

> Recommendation 5: **A national framework is needed** that includes fundamental principles of supporting FNCFS agencies, that is sensitive to provincial/territorial variances, and has mechanisms to ensure communications, accountability and dispute resolution mechanisms. This will include evaluation of the roles and capacities of all parties. [100] *[emphasis added]*

As well they recommended:

> **A regional table process** is needed to discuss this issue and come up with an action plan. [101] *[emphasis added]*

It seems clear, from the previous discussion in this paper that the development of dispute mechanisms are of paramount importance to ensure that everyone keeps their commitments to protect and provide services to the most vulnerable of our population – First Nations children and youth.

The inability of FNCFS agencies to utilize the processes put in place was noted by the Saskatchewan review panel in the *Baby Andy Report*. According to the panel, agreements between FNCFS agencies and INAC provide for a forum to discuss and analyse mutual program and policy concerns. However, the capacity of agencies to further this agenda is/limited by experience, financial resources and systematic supports. [102]

The panel suggested a starting point for cooperation:

> In order to proceed to the next level of FNCFS agency development, a focused and systematic framework for joint service improvement and accountability is required. This level of development requires a comprehensive plan that includes FNCFS agencies, the Department and INAC.[103]

The Nova Scotia government provides one example of a "dispute resolution" mechanism designed to enhance services to children, however, it is not clear whether First Nations are involved in this process. The province has set up a Child and Youth Action Committee that works as an inter-departmental working group of senior officials for co-ordination of cross-jurisdictional initiatives affecting children and youth.[104]

The Provincial/Territorial governments put forward a number of options to attempt to address this problem. One of the approaches enunciated in a 1997 paper, was described as the "comprehensive approach" which would be a cross-sector action plan to identify strategic ways of improving the social, economic and environmental conditions for Aboriginal peoples. [105] That was 7 years ago?

In the 2001 *Progress Report to Premiers No. 6* a number of recommendations are set out, including:

- Premiers called on the federal government to recognise its treaty, fiduciary, and constitutional responsibilities for the health, education, and well-being of Aboriginal Canadians and to work with provinces, territories and Aboriginal peoples on more effective delivery and financing of health, education and social services for Aboriginal peoples;
- Premiers stressed the importance of continued Aboriginal involvement to ensure that the needs of Aboriginal children are a priority as work on the National Children's Agenda proceeds.
- Premiers encouraged continued co-operation between governments and Aboriginal organisations toward addressing the education, skills development and labour market needs of Aboriginal people. [106]

Where dispute resolution processes are unavailable or ineffective decisions are being made without any recourse or involvement - negative feelings and backlash can occur between the parties involved. Arguably, this is the current situation between First Nations agencies and INAC. Service providers stressed the difficulty in achieving direct communication with INAC. Communication between the two parties generally occurs through letters; a number of agencies reported having made numerous attempts to set up meetings, with no success. [107] Anecdotally, it could be argued that agencies generally feel that INAC is

in a defensive position and that communication is strained.

Current communications between the provincial and federal governments, inter-departmentally and with the agencies seem to be grounded in a power or rights-based approach as opposed to an interests-based approach. In their study of dispute resolution systems, the Institute on Governance notes that:

> Benefits for reducing the reliance on power and rights based approaches include reduced costs; better quality decisions; greater satisfaction levels among disputants and the preservation of long-term relationships. There appears to be considerable convergence in the literature on Aboriginal justice to move in a similar direction, that is, to place greater reliance on interest-based approaches, often referred to as alternative dispute resolution (ADR).[108]

The federal and provincial governments' present approach of jurisdictional finger-pointing and avoidance has cost a great deal for all involved – especially children. The current state of First Nations Child and Family services is creating a myriad of related problems in the health and well-being of Aboriginal peoples [read children] which clearly affects all areas of social policy. Therefore, it is obviously in the interest of both the federal and provincial governments to work together with First Nations agencies to create an effective funding arrangement.

In their report, the Institute on Governance discussed possible models for a successful dispute resolution process as a component of a new inter-governmental fiscal relationship between the Federation of Saskatchewan Indian Nations, the Government of Canada and the Government of Saskatchewan. The report notes that the central issue facing First Nations, in fiscal negotiations with government, is how to avoid a sovereignty based approach on the part of government. The report notes that governments are reluctant to allow a third party to act in the role of mediator, as this negates their ability to determine budget allocation. Although a third party mediator may not be necessary, it is crucial that the government is aware of the fiscal consequences of inaction and the importance of cooperation between the levels of government, the agencies and inter-departmentally.

FNCFS providers expressed great frustration at the lack of processes in place for the resolution of issues. Suggestions made by providers as to effective processes for the future, were as diverse as the issues they face. However, a common thread throughout the responses was the concept of putting a small cross-sectional group in place to deal with the issues of FNCFS agencies. A key informant suggested that a standing committee be established, comprised of representatives of the province, INAC, FNCFS agencies and AFN. She/he noted that "in B.C. with the number of agencies and their varied size it is difficult to meet effectively as a larger group to conduct business. This was reiterated by another informant, who further stated that the process undertaken by any specified body should reflect cultural values. She noted that:

> The process may be a circle as it embodies the cyclical nature of life and has become an acceptable means of resolving disputes in this province. Regardless of the actual resolution process chosen, the critical elements of the process are respect for treaty, respect for differences and inclusiveness. [109]

This sentiment was reiterated by MacDonald and Sayers:

> The understanding of culture in the development of dispute resolution process is key to successful outcomes. Any examination of First Nations issues in Canada has to respect the cultural diversity that exists within First Nations.[110]

Moreover, a standing committee, apprised of the current issues facing FNCFS agencies and comprised of representatives from the various Stakeholders, may circumvent the government's reluctance regarding the use of a third party mediation process and yet achieve the same results. Any process, however, must be grounded in the idea that:

> …no one jurisdiction – let alone one federal department – can control decisions, resources and activities. Success depends on developing and sustaining a common vision of outcomes, objectives and lines of accountability.[111]

IV. RECOMMENDATIONS

A myriad of recommendations can be found in the literature. The 17 recommendations found in the Joint Policy Review are the most contemporary and provide a call for clarifying the jurisdictional issues:

> Recommendation 4: DIAND, Health Canada, the provinces/territories and First Nation agencies must give priority to clarifying jurisdiction and resourcing issues related to responsibility for programming and funding for children with complex needs, such as handicapped children and children with emotional and/or medical needs. Services provided to these children must incorporate the importance of cultural heritage and identity.[112]

The Ad Hoc Coalition in their submission to the United Nations recommended that:

> Recommendation 10: In the short term, implement recommendations of the Joint Policy Review on First Nations Child and Family Services, and launch a review of off-reserve funding methodologies, to ensure equitable access to sustained and culturally –based targeted prevention services.113

In order to achieve Canada's commitment, as articulated in their *Action Plan*, to honour the international rights of children – jurisdictional issues need to be remedied and/or dispute mechanisms need to be developed in order to make the following a reality:

> No. 82: Together we will strive to build supportive environments to improve the healthy development of Aboriginal children through safe, affordable housing, access to quality and culturally specific health services, child care and schools, as well as improved supports for parents, families and communities… Continued efforts should be directed at toward the development of partnerships and co-ordination among all sectors to promote and support indigenous, holistic responses. [114]

Geisbrecht J., in the inquiry into the death of Patrick Norman Redhead, provided the following recommendations in relation to funding and resource provision:

- **It is recommended that the parties** to the AJI-CWI [Aboriginal Justice Inquiry-Child Welfare Initiative] ensure that adequate funding and resources are provided in the restructured child and family services system for early intervention and preventive programming.
- It is recommended that in providing funding to child and family services agencies the provincial and federal governments specifically allocate separate funds for prevention programs and initiatives.
- It is recommended that adequate funding for professional training and development be built into the funding formulas of family services agencies.
- It is recommended that funding formulas for family services agencies not be based on population but on a model that reflects the needs and capacities of particular communities.
- It is recommended that additional specialized group homes and foster homes be developed in the province to ensure that all children who require such level 4 and level 5 resources need not wait for months for an appropriate placement.
- It is recommended that agencies be encouraged to develop specialized foster placements and residential care facilities in communities in northern Manitoba

> so that children from those areas need not be removed from their home communities in order to have their needs addressed.[115]

Further recommendations were provided in the inquest into the death of Susan Redhead, in relation to the lack of funding for adequate training of service and foster care providers:

- Based on the above recommendations, it is of critical importance that adequate funding for professional training and development be built into the funding provided to a child care agency.
- There should not only be funding provided to the Agency for training itself, but there should be provision to access provincial programs which have the expertise and are already in place to provide the kind of training required.
- There must be a rationalization of the method of funding to the Agency in order to allow for services to families and prevention programs.[116]

In summary, it is of the utmost importance that all stakeholders, provincial, federal, and First Nations governments/departments/ministries must find some way to resolve the long-standing jurisdictional disputes that have caused and continue to cause such unnecessary harm to First Nations children and youth.

V. CONCLUSION

> *It seems inconsistent with a modern Western industrial democracy that the welfare of hundreds of thousands of people is a matter of intergovernmental avoidance.* [117]

The impact of ongoing jurisdictional disputes on Aboriginal children has been well documented. Both the federal and provincial governments are aware of the effects of policies of avoidance and yet cooperation has yet to occur, and the current situation persists.

The federal government persistently contends that the provision of social services is within provincial jurisdiction and therefore any federal services and programmes are merely provided on a humanitarian basis.

> The federal approach is a defensive one, predicated on the notion that Parliament cannot be compelled to legislatively take responsibility, even if not doing so causes Indians harm. [118]

Alternatively, the provincial government and First Nations assert that the federal government has a constitutional, treaty and fiduciary obligation to provide adequate social services, including child welfare, to Aboriginal peoples in Canada.

Clarification of jurisdictional authority may be attempted through litigation. This, however, would be a long and costly process during which the pressing needs of Aboriginal children would continue to be unmet. The needs of these children cannot be placed on a shelf while the various levels of government and departments argue over budgetary constraints and differences in the interpretation of existing agreements.

There are no legal jurisdictional issues that bar governments from working together to improve the services and programs provided to First Nations children. The only bar appears to be that governments are more willing to dig in their heels, as a means of protecting their budgets, than to recognize and move forward in finding a solution to the appalling state of First Nations children.

Lack of will to find solutions is exacerbated by the lack of processes to discuss, analyze and resolve the issues. FNCFS agencies are faced daily with the effects of inadequate funding and resources and are deprived of a forum for expressing their frustrations. Effective and accessible dispute resolution processes are critical to the resolution of issues in First Nations child welfare. Any changes to the current funding formula will undoubtedly raise new issues and concerns for FNCFS agencies and the ability to express these concerns and find solutions will be crucial to the success of a new fiscal relationship.

The success of any dispute resolution process hinges on the recognition, by all parties involved, of the commonality of interests. Governments, ministries and FNCFS agencies must realize that improving/enhancing the health and well-being of First Nations children is in the interest of every Canadian. Further, it must be recognized that neither the simple addition of funds nor a simple change of policy will resolve the issues faced by FNCFS agencies. What we do know to be true is that this debate has gone on for too long and as a result First Nations children have and continue to suffer. It is of paramount importance that dispute mechanisms be implemented as soon as possible. Our children are our future.

In keeping with the United Nations Convention on the Rights of the Child, we recommend that a child first principle be adopted in the resolution of inter-governmental jurisdictional disputes. Under this procedure the government (provincial or federal) that first receives a request to pay for services for a Status Indian child where that service is available to other children, the government will pay for the service without delay or disruption. The paying party then has the option to refer the matter to a jurisdictional dispute resolution table. In this way the rights of the child come first whilst still allowing for the resolution of jurisdictional issues. In honor and memory of Jordan we recommend the child first principle to resolving jurisdictional disputes be termed Jordan's principle and be implemented without delay.

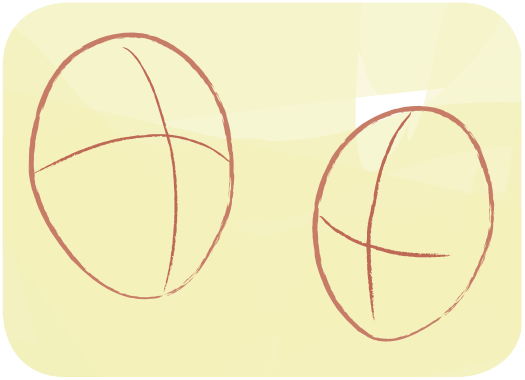
Promoting Community & Family Wellness

Least Disruptive Measures and Prevention



CHAPTER 4

Prepared on behalf of:
First Nations Child & Family Caring Society Canada

Written by:
Dr. John Loxley and Linda Deriviere

July 2005

THE COST OF DOING NOTHING

Recent economic analyses on the costs of child abuse offer much evidence that the fiscal and societal outcomes of child maltreatment are staggering. Bowlus et al. (2002) calculate that $15.7 billion in societal costs can be avoided by preventing abuse and by allowing children to reach their full potential as contributors to society (p.104). The relationship between child abuse and later involvement with the justice system has also been captured by Hepworth (2001) in ***Jack's Troubled Career: The Costs to Society of a Young Person in Trouble***. The analyst has estimated the intergenerational effects of child abuse on the criminal justice system and other social services at roughly $511,500 per child. Other analysis has been conducted in the area of the health outcomes related to child abuse. A Saskatoon study found that adult female survivors of sexual abuse used 4.1 times more costly health services than the average population (Burgess et al. 2003). These are only a few of the fiscal and social consequences that make the rationale for prevention evident.

Analysts argue that the solution to mediating the incidence of child maltreatment lies partly in tackling the dire economic state of First Nations communities. Socio-economic factors, such as poverty, create many stressors in daily life that lead to family violence, addictions and youth detachments from formal schooling. The Royal Commission on Aboriginal Peoples (RCAP 1996) estimated that the lost productivity to aboriginal people in terms of unemployment and forgone earnings, in part from lack of education, as well as lower wages relative to other Canadians, totaled $2.9 billion in 1996 dollars. Another $4.6 billion was lost to the government from forgone tax revenues and other direct fiscal expenditures[1] above the average for the general population. Analysts calculated that "the cost of the status quo will rise from $7.5 billion in 1996 to $11.0 billion in 2016" (cited in McCallum 1999:124), a 47% increase.

These studies illustrate that the case for setting priorities in prevention is convincing, as it is not only fiscally prudent, but it is a humanitarian approach to averting child maltreatment. There is plenty of evidence that the fiscal commitment towards direct child protection will continue to rise in future if policymakers and society in general choose not to address these issues. In this chapter we present further compelling evidence, which illustrates that the costs of preventive interventions are minimal in comparison with the limitless costs of the alternative – doing nothing.

To begin with, the present funding formula provides more incentives for taking children into care than it provides support for preventive, early intervention and least intrusive measures. The 1998 Canadian Incidence Study of Reported Child Maltreatment (CIS-98) has documented an overrepresentation of Aboriginal children in foster care placements and other institutional settings compared to non-Aboriginal children. Socio-economic hardships, such as poverty and substandard housing, intergenerational child maltreatment, as well as addictions are key contributors to this phenomenon (Trocme, Knoke and Blackstock 2004). However, funding arrangements may also create perverse incentive effects that work against family-based approaches, which may be in the best interests of a child's well-being. Flette (2004) argues:

> "Current funding of FNCFS provides money for children only when they are in foster care or group care. No money is available for services to neglected and/or abused children in their own home. Services/funding to work with families to return children home have come under attack and are no longer available. In the mid 90's, DIAND eliminated completely the funding to agencies in Manitoba for Services to Families. This remains a service that agencies are required to provide in legislation, and the Province provides funding for this service to its agencies, separate and apart from Operations. DIAND policies result in on reserve children who are suffering from abuse and neglect not having access to comparable services in their own homes" (p.3).

In addition, though Aboriginal youth represent

a high proportion of Canadian children in care, the funding that is committed to this group is disproportionately lower than what is allocated to non-Aboriginal children (Flette 2004). It is estimated that, of the Canadian children living in out-of-home placements, 30-40% is Aboriginal children (Blackstock et al. 2004), while only 5.6% of children in the Canadian population are Aboriginal (Statistics Canada: Census 2001) [2]. Over the period 1995-2001, out-of-home placements for registered Indian children on reserve increased by 71.5% at a national level (McKenzie 2002), yet the latter's population (below age 15 and between 1996-2001) fell by 1% (Statistics Canada 2001, cited in Blackstock et al. 2004: 157). It is also known that welfare costs are rising at a rate of 6% per annum, while additional funding directed to Aboriginal children is not forthcoming[3]. Moreover, DIAND's financial support to First Nations child and family services agencies is roughly 22% lower than the average provincial funding (based on 1999 dollars) (National Policy Review June 2000, cited in Blackstock et al. 2004; Flette 2004).

The purpose of this chapter is to identify what is best practice in this area, for the information of agencies, but also in order to document the case for a change in the national funding formula. We also want to determine how a more preventive family well-being model should be included in the funding formula, as well as what the net cost implications would be. The latter involves not only estimating the costs of preventive measures, but also the savings that might accrue through limiting or reducing the number of out-of-home placements, as a result of alternative measures being undertaken. An estimate can be derived by examining the experience of agencies that have made the transition to emphasizing more preventive measures, such as the West Region Child and Family Services agency.

This chapter summarizes how a strengthened prevention agenda can be used to generate social and economic change in First Nations communities. The structure of information gathering for this project involved addressing three key components, including:

1. A review of the relevant literature and participants' feedback from a workshop on prevention informed the question of what is best practice as it pertains to preventive and least disruptive measures in primary, secondary and tertiary prevention.
2. An economic cost-benefit analysis addressed the question of what are the realistic fiscal savings that could be expected by reducing the numbers of children in care.
3. Gaps in the current national funding formula are identified. Recommendations are put forth on new areas of required programming and different possible approaches to funding them. We address the question of how a funding formula might incorporate this range of services, but at this stage, cost implications are dealt with only in a very preliminary fashion.

LITERATURE REVIEW

To begin with, the review of a significant child welfare literature informed the process by identifying what is deemed to be the best practices in primary, secondary and tertiary prevention work, including least disruptive measures (see Appendix 1). There is general consensus that the traditional practice of placing greater emphasis on child protection through the removal of children from their home or the cultural environment of a kinship system is immobilizing, in terms of building healthy First Nations communities. Many authors point out that such practices often result in a revolving door between foster care placements and returning home. Not only does this process endanger the child's sense of well-being, but it is more costly from a fiscal viewpoint, as the child's needs become even more complex. Indeed, the risks of child maltreatment are not necessarily reduced from a placement strategy outside the child's cultural setting[4]. The traditional approach to custodial care often defeats the intended purpose of a child well-being model of service delivery.

In contrast, a family-centered and family-preserving approach within a community-building framework and with much cultural content is perceived as a high-need area in the efforts related

to child protection. Many analysts propose that a prevention agenda, which keeps children in their home or, in more complex cases, within the kinship system is seen as integral to the child protection function. Family functioning itself needs mending with cultural healing strategies, in contrast to a heavy reliance on external custodial care. There is general consensus that incorporating a more proactive family-centered component to a child well-being model requires more appropriate levels of financial resources to carry out this work. But the current measures lean heavily toward a reactive level of tertiary intervention only. The major work that needs to be done in First Nations communities is in the area of primary and secondary level strategies in order to reduce the enormity of crisis-related interventions that emerge from a lack of services to begin with.

From this viewpoint, analysts in the field suggest that the solution is partly in a diversity of primary and secondary prevention services, which would redress some of the systemic or socio-economic issues in these communities. A comprehensive inventory of such services is listed in the appended literature review. The current situation is that these services, if offered at all, are often fragmented and poorly funded. They do not always serve the complexities of a family's dynamics very well. Thus, a general lack of proactive and multi-faceted preventive programs can be endangering to child and family outcomes.

Though the analysis in the literature review conceptualizes prevention in terms of primary, secondary and tertiary classifications, to some extent, this is incongruent with the notion of holism in Aboriginal terms. Program strategies often entail a continuum of overlapping and interlocking child welfare services that comprise all three levels of prevention. As described in the literature, preventive actions are often effective on several levels. The demarcation into separate levels of prevention stems from a public health model of prevention, in which such categorizations are distinguished by the level of risk exposure for the child or family. In some ways, this is in contrast to the meaning of prevention within a social work context.

Nevertheless, a regimented distinction between the different categorizations of preventive activities does permit the conduct of a review of the multi-level range of potential preventive services compared to the current services under the existing funding arrangements. It also allows us to identify the new financial commitments, which would appropriately serve families in First Nations communities. In other words, through such distinctions, the financial needs can be tied to specific preventive services. Consequently, the demarcation into various levels of prevention is not intended to create fragmented and inflexible services where it concerns program development and delivery.

To sum, the current reality is that many First Nations Child and Family Services agencies deal with high-risk families in which services typically fall into the category of tertiary intervention or, at a minimum, secondary prevention in terms of risk intensity. But current funding levels need to be reworked in order to make funding resources available so that agencies can address the issues of family dysfunction long before high-risk conflict situations surface. Funding is also needed to begin the process of strengthening social capital in these communities, which has potential for improving the chances of fostering First Nations independence. An appropriate response requires a multi-faceted approach in contrast to the current situation in which programs often deal with a narrow range of child protection issues only.

CONSULTATIONS WITH SERVICE PROVIDERS

The range of preventive programs identified in the literature review were also confirmed via a consultation process with analysts and service providers in the area of child welfare who were brought together in a one-day workshop on April 29 2005, at the Fort Garry Hotel in Winnipeg. Participants came to share their thoughts and experiences on child welfare issues and outcomes. Presentations by the workshop participants illuminated a variety of perspectives on the meaning of prevention in child and family

services. From the discussions, we assembled a list of challenges and program needs that were identified during the workshop. The meeting also drew on notes on an earlier consultation with representatives of the West Region Child and Family Services agency and a consultant with extensive experience in this area.

There was general consensus that the current funding arrangement works against having a comprehensive preventive agenda in First Nations Child and Family Services agencies. Heavy emphasis must be directed at a traditional or cultural component to family healing. More sustained funding is required in order to maintain the few existing preventive programs, in contrast to the current practice of relying heavily on grant dollars. Presenters spoke about the fact that there is room to do alternative programming given the current child welfare legislation, but the problem is with freeing up the funding in order to do this programming appropriately.

During the workshop, seven major highlights were identified by the presenters:

1. **Prevention is an investment in people upfront.** Legislation and the consequent funding arrangements must be prevention-oriented. There is critical need in the area of prevention, as only this type of approach permits the incorporation of Aboriginal values of holism. How much the government invests in families upfront, via primary and secondary prevention, is a good indicator of how many families and children will end up at a tertiary or reactive intervention level. The damaging effects from many children's past negative experiences in foster care placements provides evidence that agencies must be involved with families long before crisis ensues.

The current problem is one of access to a 'seamless continuum of care' in preventive services in order to decrease the number of children from entering formal care situations. Prevention involves plenty of focus on parenting capacity and other services that are likely to lead to purposive changes, but a key theme is that agencies can not always fit people into preventive models. Conversely, programming models have to fit to people's needs. Therefore, multifaceted and flexible interventions are needed in First Nations communities.

2. **A multidisciplinary and collaborating model of intervention is needed.** Service provision to children and their families should reflect a coordinated approach to better deal with many co-existing risk factors. For instance, the child and family services team must have the ability to collaborate with schools and other organizations, such as Child Find, on personal safety issues. Agencies need to partner with employers in the area and the leadership in the community via community task forces. For example, task forces could deal with issues of violence, sports and recreation for young people, as well as parental involvement in behavioral issues. Agencies need to work collaboratively with the health sector, other community-based organizations, and the kinship system.

A multidisciplinary service approach is critically important to prevention in child welfare outcomes, since there is evidence that the physical and mental health issues of Aboriginal children can be very complex. Child welfare agencies can not be self-sustaining, and they must use the human resource base of the community.

3. **Environmental issues – poverty, substandard housing and sanitation, and low educational and employment status –** matters very much where it concerns addictions, abuse and intergenerational family dysfunction. Current strategies are equally lacking the necessary preventive work from a community economic development approach. Indeed, the experience of daily living with these socio-economic issues and all of their consequent problems has left a legacy of developmental disarray in First Nations communities. For example, the literature review indicated that First Nations communities are beset by high suicide rates among youth, as well as disturbing levels of drug and alcohol misuse. Such phenomena are symptomatic of the multitude of stressors that young people encounter on a daily basis, and which are rooted in a very alarming rate of developmental erosion. There are enormous risks associated with the

expansion of child welfare services without allocating financial resources to some of the bigger developmental issues.

4. **Flexibility in funding to do multi-dimensional or multi-faceted programming** is viewed as being a best practice in preventive work. Curriculum-based programming has proven effective in many initiatives (e.g. Vision Seekers in the Skownan First Nation), but this is not necessarily the experience of all participants. Not all individuals can fit into a particular curriculum. For instance, two people may be affected differently by the same parental training program, with one individual needing a more intense intervention. Programs must bend in many directions to serve the needs of particular individuals and family healing strategies. Home visitation programs may involve lower caseloads for social workers and other agency service providers. Indeed, the challenge is for funding levels to adequately meet the enormity of this task.

A human development perspective to meeting the needs of children means that specific community problems are approached with a customized service delivery model from a variety of overlapping perspectives. Multi-generational family dysfunction means that multifaceted interventions are needed. These issues are not solvable with single dimensional program provision. It requires a different way of thinking around programming, such as restoring the relationship between child and community. The workshop participants pointed out that programming can always be done differently, that is, with flexibility as a key component. One size fits all types of services are not always proven effective.

5. **Service infrastructures are lacking in remote communities.** There is a need to secure adequate levels of funding, which will allow remote communities to build up their physical infrastructures, as well as the capacity of human expertise internally. This would permit more services to be offered within isolated communities as opposed to sending people outside the community, in particular, as it relates to youth with disabilities or special needs. There is a lack of physical resources and respite services needed to keep special needs children at home in such communities. This is a big issue in the North. Agencies can not continue to rely on outside expertise brought into the community, as it creates discontinuity in service provision from the comings and goings of professional staff. There needs to be a base of case workers with internal obligations or connections to these communities so that they can establish trusting relationships and continuity with families.

Funders also have to recognize that it may be less expensive to pay a psychiatric nurse to go into the home and to spend time there than to take the family out of the community to receive services in a larger center. Developing the human resource base of professionally trained people is important in terms of staff understanding the internal dynamics of a community, that is, how the community perceives and internalizes the healing process, as opposed to imposing it from the outside.

6. **Building a human resource base and community volunteer capacity** in First Nations communities must be a priority. Agency staff must be trained to take a broader community development perspective. The issues extend well beyond simply training professionals via a university degree. A trait of flexibility in prevention workers is an essential component of the work. Approaches that help to build social capital include:

   - A holistic outlook to community roles and responsibilities by building a volunteer base of peer support. Community volunteerism must be the new way of thinking. For example, a community mentoring program could place individuals who have successes as parents in a mentoring role to other families with parenting challenges;
   - Intensive training for foster parents; - A supervisor training program within agencies in order to foster a preventive mindset;
   - Training specialized staff to work in rural areas through the Bachelor of Social Work (BSW) training program;
   - Developing agency staff's skill set in order

to expand their comfort level with adult education, teaching and group facilitation.

7. **Capital investments are lacking in First Nations communities.** In most First Nations communities, there is also a need for a comprehensive plan relating to the capital requirements that would build up the physical infrastructure. Funding needs to address the ability of agencies to secure buildings and facilities and to have control over them. For example, internally-managed therapeutic foster care treatment units are crucial capital investments that will ensure stability and consistency for long-term placements, such as high needs/high medical needs children in foster care. Maintaining residential programs is essential to ensuring an Aboriginal content to programming.

From the presentations and the literature review, we devise specific recommendations for a revised funding formula. But first, we summarize the results of our investigation into the potential cost savings from a variety of alternative preventive strategies.

COST-BENEFIT ANALYSIS

In the current analysis, we were also asked to focus on answering a further question, as follows: **What are the realistic savings that can be expected by reducing the numbers of children in care?**

A brief economic cost-benefit study of a handful of the West Region Child and Family Services agency's programs, in the Province of Manitoba, informs the analysis with plenty of tangible evidence that the monetary cost savings and cost avoidance from prevention are substantial. Though this agency could rely on a substantive human resource base and an operational infrastructure in place, which allowed the staff to implement such programs, most agencies do not have the capacity to carry out such preventive initiatives within their existing funding levels. Nevertheless, the calculations demonstrate a critical need to re-direct policy costs in favor of primary and secondary

preventive services as a principal component of the casework model, while still adequately reacting to more complex cases of high-risk family conflicts. The highlights of the cost-benefit calculations for only a few programs offered by one community-based child and family services agency are summarized in the following:

- The fiscal savings from the Vision Seekers program, which has been operating in the Skownan First Nation Community in Manitoba for around five years, totals in excess **$25 million**. The program takes a human development approach to its residents' needs on the matter of education and employment. It offers life skills workshops, adult education, a community-centered therapy program, a career-trek program for young adolescents and their parents, all from a holistic Aboriginal family and community healing perspective. This is a fine example of preventive work that fully engages a community at all levels – children, adolescents, youth, parents and Elders. It appears to return $6.2 in savings in present value terms to the WRCFS for every $1 spent. When savings to other agencies are include, notably social assistance savings, a benefit to cost ratio of 16.5 appears to be returned, which is huge.
- The Gaa Gii Kweng (GGK) therapeutic foster care program has also demonstrated substantial economic cost savings for twenty-five special needs children in the federal children in care program. The net present value of the cost savings in custodial care for these 25 children

(in 2005 dollars) from internally-managing a therapeutic foster care service totals **$2.0 million**. At times, for more complex and high-needs child welfare cases, out-of-home 24-hour care is absolutely required. However, this comparative review with other residential care facilities located within the mainstream system has illustrated that First Nations Child and Family Services agencies need to ensure that therapeutic support services are provided within their own communities so that they can guarantee an appropriate cultural component.

- The Reclaiming Our Voices Project involves a three-day retreat for individuals who have significant issues with addictions and maintaining sobriety. Roughly 900 participants over a six-year period have received services from this initiative. Over this period of time, the savings in foster care from preventing children from entering formal care, as well as returning some children home, have exceeded **$14 million**. Furthermore, another **$63 million** in savings is expected to materialize in future from the prevention of FAS/E afflicted children, due to their mothers' maintaining sobriety during a pregnancy. The intergenerational outcomes and costs savings, though difficult to measure, are expected to be substantial. In short, this program appears to return $60 in present value terms to WRCFS for every dollar spent by the agency.
- The Treatment Support Unit, which involves intensive family preservation and reunification services, has prevented roughly 212 medium-to-high risk children from entering formal care. The net savings in foster care over a nine-month period exceed **$2.9 million or $3.9 million over a full year.** Keeping children in their homes, or at the very least within their kinship system in the community, is not only a preferred alternative which is best practice from a least disruptive approach, but the cost avoidance effects prove it to be cost efficient and effective, as well. Theis project appears to yield $12.8 in benefits to WRCFS (in present value terms) for every dollar expended.

While one should be cautious in using these ratios of benefit to cost, the bottom line is that returns to spending on prevention are huge and hence spending more on prevention makes sound fiscal sense.

Another way of approaching the issue is to take an aggregate view of the dollars saved by WRCFS by investing in prevention, in terms of NOT putting children into care. Estimates are over $1.5 million per annum after allowing for the cost of prevention programs. The case for paying more attention to prevention is, therefore, an extremely strong one, not just in human terms (which, after all, is really what counts), but also in fiscal terms.

No one questions that there is a need to sustain the existing reactive or tertiary system, which addresses high-risk family environments in which children face a high probability of abusive situations. The cost-benefit analysis illustrates, however, that a shift in focus must be directed to family preservation and reunification whenever possible. A key component in this is that agencies may be able to better provide their own therapeutic foster care residential facilities. Further, community capacity building efforts, such as the Vision Seekers and Reclaiming Our Voices projects, demonstrate that there are substantial fiscal benefits to providing First Nations agencies the adequate resources so that they can offer a continuum of high-quality primary and secondary preventive services. There is a high probability that such services will consistently meet the challenge of optimizing the government's investment dollars in fiscally sound ways.

THE UNDERFUNDING OF PREVENTION AND MAINTENANCE IN THE CURRENT FEDERAL FUNDING FORMULA

The final question is posed: **How should a funding formula incorporate this range of services and at what cost?** Put differently, what amount of funding would adequately equip First Nations communities with the vital financial resources needed to carry out the prevention task in order to respond to their needs of their residents? The starting point is that the current INAC funding formula for Operations makes inadequate provision for prevention services.

Since the early 1990s, the INAC formula has been based on child population figures (0-18 years). Analysts and service providers in the field generally agree that most First Nations Child and Family Services agencies are precluded from implementing prevention programs due to a lack of funding within the current formula. More dollars would reduce the current heavy workload situation, and it would release some staff time so that they can focus on a preventive agenda. In this section, we identify gaps in the current federal formula based on the general philosophy of care in First Nations communities, which involves an ecological or holistic approach. In this general overview, we also include a discussion of the treatment of prevention in the current funding formula.

The existing Operations Funding Formula of INAC is discussed at length elsewhere in this report. In essence, operations funding is driven by two main variables and a few other less important variables. The main variables are the number of children in the 0-18 age group and a fixed amount per child, $727. These account for by far the greatest proportion of funding. In addition, there is a fixed amount per agency, which also depends upon number of children in the population being served, and which can reach a maximum of $143,000 and a fixed amount per band of $10,700. The three fixed amounts (per child, per agency and per band) are then adjusted by the INAC remoteness factor. These are the only variables determining funding.

In notes accompanying the formula, INAC explains that the fixed amount per agency is intended to cover the cost of a Director's salary, benefits and travel; a secretary, a financial officer, audit, evaluation, legal costs, ongoing organizational development and training of placement resources.

The fixed amount per band is intended to cover the costs of boards of directors, and of local and elders' committees, including travel and training.

The amount per child is intended to cover the costs of direct protection, resource development and prevention services, professional supervision, special services purchases, off-hours services, staff salaries, benefits and travel and overheads (rent, telephone, office supplies and utilities).

The formula is said to be based on the following assumptions: 20% of families need services; 6% of children are in care; the need for core positions in all agencies; supervisors at a rate of 1 to 5 staff; child care workers and family support workers at a ratio of 1:20 children: support staff workers at a ratio of 1:5 workers: wages based on average salary scales in Manitoba and Ontario.

The basic problem with the formula is that there is no periodic reconciliation between the amount of money calculated under the formula and the cost of the services those funds are supposed to purchase. It is not clear, therefore, that agencies can actually purchase the services they are supposed to. In fact, there is very good reason to suppose that in many cases, they cannot. Thus, there has been no adjustment for salary increases or other increases in the cost of purchasing services since the formula was introduced some 15 years ago. Any increase in funding has come, therefore, from increases in the number of children. In the circumstances, **either** the quality of services must have declined if child and family needs grew proportionately with population **or,** increases in costs of services can have been covered, if at all, only from a reduction in the proportion of children or families receiving services.

The consensus among First Nation agencies is that the funding formula makes inadequate provision not only for inflation but also for travel, legal costs, insurance, front-line workers, staff benefits, program evaluation, accounting and janitorial staff, staff meetings, Health and Safety Committee meetings, security systems, human resource staff for large agencies, quality assurance specialists and management information systems. Funding has not reflected the significant technology changes in computer hardware and software. Liability insurance premiums have increased substancially over the past decade. Agencies are expected to allocate these costs to the operational funding category ($143,000), which has not kept pace with inflation since the mid 1990s. Regional Tables were formed across Canada in response to the National Policy Review in 2002. The Manitoba Regional Table (MRST 2002) participants have argued, "If agencies are unable to purchase liability insurance, they are in breach of their legislative responsibility" (p.6). And if they do find the money for the liability insurance, from which other operating item will it come?

There are also a number of expenditures currently charged to the Operating Budget which might be better charged to the Maintenance Budget. The Manitoba Regional Table (MRST 2002) has identified a number of concerns relating to expenditure categories, which INAC considers as falling within the operating budget, when in fact these costs are directed associated with child protection activities [5]. These include:

- The operational budget base of $143,000 is inadequate to cover the high legal costs for bringing children into care, such as attending court proceedings and preparing case plans for the courts. These and other extraordinary or unavoidable expenditures, such as the costs of inquests and medical examiner's recommendations, can easily consume a large portion of the operational budget in any given year. Frequently, these items are directly associated with having the child in care.
- Psychological assessments, subsidized adoptions, repatriation and unification costs (in-home support services when a child has been reunited with their family), and homemaker services are all related to providing for the needs of a child. There is also government funding disputes with respect to mental health therapies for children, which can be disruptive to a child's emotional well-being. Operational funds should not have to accommodate these costs.
- Some travel costs should also be billable under the maintenance budget, for example, if a worker has to escort a child to a major centre to receive services. From a service perspective, it is less traumatizing to a child if a worker who is familiar with the child accompanies him/her to a major centre in the situation where psychological or treatment services are not accessible in a community. However, travel costs that are not recoverable through FNIHB should be billable under maintenance, since they are directly associated with having the child in care.

These are only some of the purchased services that are directly related to the child care function. But agencies are mandated to offer such services under provincial legislative statutes. Hence, all these costs should be billable under maintenance budgets. They do not belong in an operations formula, since the expenditures are directly associated with child protection activities.

Often the issue is one of disallowed expenditures, which surfaces during the periodic compliance reviews. Consequently, maintenance billings are disqualified due to mismatched policy interpretations. For example, INAC is known to disqualify emergency services on reserve (INAC 2003). Flette (2004) argues "DIAND maintains that money for services to abused and neglected children in their own homes is found in agency operations budgets while at the same time they acknowledge that these are unfunded items in the operations budget" (p.3). Thus, there are plenty of inconsistencies in approved funding, which do not reflect the agencies' legal obligations under provincial legislative statutes. At other times, expenditures are disqualified due to jurisdictional payment disputes, as INAC argues that it is not the "first payer" for certain costs. An example involves government jurisdictional disputes with respect to providing services to children with complex medical needs.

More importantly, for the purposes of the issue under discussion, the formula provides insufficiently for prevention services. This shortfall has a number of dimensions. Firstly, if overall funding is inadequate, direct front-line services to children and families will receive priority and preventive services will be neglected, simply because of the urgency factor. Secondly, while the $727 per child notionally includes funding for two prevention workers per agency, provision for one prevention worker per band might be more reasonable. Moreover, remote communities may need more prevention workers. West Region Child and Family Services agency in Manitoba would argue that the number of child care workers and the number of Family Support/Protection workers should both be increased from 1 to every 20 children in care to 1 to every 15. The $727 also provides for one resource worker per agency, but again, WRCFS argues this should be increased to 1 for every 20 foster homes. If all these adjustments were to be made, WRCFS would need an additional 17 staff to undertake prevention work appropriately, at a cost of approximately $1 million, or of about 45% of its existing INAC budget. The main drivers here are the additional prevention staff per band and the additional Resource Workers.

Access to prevention funding is also undermined by jurisdictional payment disputes. For instance, INAC does not pay for day care services to foster children on reserve, which is known to promote healthy child development in the early formative years (MRST 2002). The CFS Act requires First Nations child welfare agencies to provide such services. To date, HRDC has been providing minimal funding for day cares on reserve and, consequently, there are a limited number of spaces available.

Much of what WRCFS has achieved in the area of prevention has been funded not through the Operations Budget, but through the Maintenance Budget, via the block funding or Flexible Funding Option for Maintenance (FFOM) approach (previously known as block funding). Though FFOM does provide a solution that has achieved some successes in various agencies, the workshop participants pointed out that there are many reservations associated with block funding, including:

- Such a funding arrangement may not be suitable for all agencies, since it requires a level of management maturity and sophistication.
- The West Region Child and Family Services agency currently runs a deficit under the flexible funding option for the reasons that were discussed earlier (funding levels not keeping pace with inflation, etc.). While there is much emphasis on WRCFS as a model of flexibility in the use of funded dollars, this detracts from the key problem that there are too few dollars being allocated to agencies. It is imperative that the initial funding level for a FFOM be appropriate and that cost of living increases for prevention programs be included in the adjustment factors.
- Furthermore, a flexible funding option must be truly flexible on the programming side if services are to be tailored to specific community needs. Agencies should not have restrictions placed on the type of child welfare delivery model that they can offer in their respective communities.
- A flexible funding agreement must allow for unforeseen circumstances since certain crises or emergencies may cause maintenance costs to increase substantially. This would force an agency to reallocate basic maintenance dollars that were initially targeted to prevention initiatives. There is an exceptional circumstance review process within the existing policy; however, it has many gaps.

The consensus was that too much uncertainty is generated when an agency has to rely on their block maintenance budget to do preventive work. The effects can be devastating if things go wrong. Cash flow problems are immediate if an agency has one high medical needs child that comes into care unexpectedly. So there is a need to investigate other solutions to the funding of prevention programs.

Finally, it is also noted that the issue of compulsory services under provincial statutes versus discretionary programming needs to be addressed further. Although direct child

protection expenditures are mandated under provincial legislation, there are several other categories of discretionary costs that should be provided by law in order to maintain consistency with Aboriginal values. For example, many preventive community development expenditures do not fall under the statutory legislative standards, even though these items contribute to family healing strategies, which should be funded.

As a further example, in all provinces, child welfare agencies are required to remove children from the home only after initial attempts are made toward family preservation with least disruptive measures (i.e. keeping the child at home) [6]. But according to the Joint National Policy Review, this legislative standard is not funded consistently from one province to the next (Blackstock et al. 2004: 167-8). The fact that the groups of services which constitute the different levels of prevention/ least disruptive measures are not always clearly defined in the CFS legislation, and thus they are not necessarily funded, also undermines the ability of FNCFS agencies to provide appropriate programming (Shangreaux 2004). There needs to be more discussion about the levels of prevention – primary, secondary and tertiary – that could be legislated consistently across jurisdictions, as well as funded universally, in order to ensure that programs are based on a more holistic community development social planning process.

Blackstock et al. (2004) have argued a "disconnect between the funding and the jurisdiction as resulting in inequity of services to Status Indian children in Canada" (p.160). The Auditor General of Canada (1998) has stated:

> "14.76 Arrangements [funding arrangements] vary by province, and in some provinces Indians are not entitled to a whole range of services that may be available to Indians in another province. In Saskatchewan, for example, no preventive services, which Indians view as the most valuable, are available to Indians because they are not part of that province's service package. This is a direct result of federal recognition of provincial jurisdiction and of adhering to provincial standards for child welfare. In addition, because child welfare agreements with individual bands within a province vary, all bands in that province may not be entitled to the same range of services or the same level of funding" (Auditor General of Canada, 1998: Section 14.76 cited in Blackstock et al. 2004).

To conclude this discussion, there is little uniformity between the federal policies versus provincial standards around child maintenance funds, which is discriminatory. For instance, the Manitoba provincial legislation provides for three additional years of extended care to permanent wards beyond their 18th birthday, particularly, if the youth is participating in an education and training program. The same policy is not applied to federal children in care, as it is assumed that they will be covered under adult services. However, adult services are generally absent on reserve. Flette (2004) argues that the current practice of the treasury board authorities is to flag these funding disputes as "anomalies" to "bring agencies in line with Dir 20-1, rather than moving ahead to implement the NPR [National Policy Review] recommendations" (p.4) [7]. It has the effect of "creating a discriminatory two tier system for First Nation children and families, when compared to provincial systems" (ibid, p.4). Funding gaps lead to a lower standard of service in First Nations communities.

FUNDING RECOMMENDATIONS

This final section presents broad funding recommendations, which characterize a shift of emphasis to preventive and intensive family work. The workshop participants identified three broad funding options. Ongoing cost of living adjustment would be incorporated into all three approaches. In addition, as an interim measure, funding formulas could be adjusted to the current levels in terms of salary and benefits adjustments. This option would suffice as a temporary solution.

The goal of all three options is to eventually have a lower proportion of funding allocated to

maintenance costs for children in care, and a much higher percentage of the funding formula being given to preventive programs and community development or family healing initiatives. In other words, the shift in emphasis is from out-of-home child protection to intensive family services, as well as primary and secondary prevention.

Option #1 A Multidisciplinary Team Approach to Funding.

For instance, for every 'X' number of statutory workers, the team must include 'X' funded prevention or community development worker positions. Staffing can be broken down into various groupings. This is a multidisciplinary team approach. The prevention worker must be offered a similar salary scale to other professional staff on the team. Finally, a funding formula has to consider that a multidisciplinary team approach takes up more staff time to get the job done, due to ongoing collaboration.

This approach would include the following budget categories:

(1) **A maintenance line.** This would not differ substantially from the current practice, though its funding levels should recognize provincial legislative differences in programming, as opposed to trying create national uniformity in its funding practices. The problems identified above with respect to billable direct child protection expenditures should be addressed (legal, travel, homemakers, psychological, counseling, etc.). Presumably, as a shift takes place towards fewer out-of-home placements from the traditional child protection function, the required funding in this budget category should decline over time.

(2) **An operating line,** which could depend on the number of staff, as opposed to a population formula. Nevertheless, this line should include the appropriate adjustments for salaries (with inflation adjustments) and benefits (an increase to 15%), adjustments for high insurance costs and other identified gaps and inequities in the earlier discussion. The resource worker who recruits and support placement resources (foster care component) is included under this budget line.

(3) **A prevention line** tied into the number of staff or some notion of children in care/ family files opened. These would be specific positions, such as prevention and community development workers (1 per band suggested earlier to focus on primary and secondary level strategies), child care workers at the rate of one for every 15 children in care in order to provide intensive family support (tertiary level intervention), family support/protection workers (i.e. in home visitation) also at the rate of one for every 15 multi-problem families (tertiary level intervention). In addition, there also has to be specific positions to do outreach, advocacy and funding proposals (1 position for each agency).

Operating costs and staffing must also increase as the maintenance and prevention budget lines increase (i.e. accounting staff, administrative support). Moreover, for every five supervisors or administrative office staff, there should be one additional manager added to oversee their activities.

Teams would have to work with communities to design prevention programs appropriate to the ability of the agency to implement them and according to the absorptive capacity of the community being served.

Option #2 – Link Prevention Funding to Children in Care and/or Families Receiving Services.

The idea is that funding for prevention should be based explicitly on in-care days, families receiving services or some notion of the caseload. Prevention would be built into the caseload formula. This would borrow some of the features of those Provincial Funding Formulae which are driven by service rather than by number of children in the community. There would be a separate budget line for prevention, arrived at by applying a formula,

perhaps along the lines suggested earlier; viz, 1 prevention worker per band above a certain size, depending also on remoteness; 1 Family Support/ Protection worker and 1 child care worker to every 15 children in care; and 1 resource worker for every 20 foster homes. This budget would be separate from and in addition to the Operating Budget.

A variation on this would be would be to base the provision for prevention only on the number of families receiving services, on the grounds that working with families is the way to prevent having to take children into care.

In either case, the proposal deals only with a way of determining funding. Staff and the communities concerned would need to determine how that funding is used, although the successful practical experiences outlined earlier might act as a guide..

Option #3 – Link Prevention to an Accreditation System

This funding arrangement is based on an incentive system. It also integrates a system of accountability and transparency at different stages of capacity or levels of funding. Concerning the base funding to agencies, INAC's current funding formula would be applied in principle at all levels of capacity, but it would be enhanced (or replaced) to account for some of the concerns expressed in the earlier section and elsewhere on existing gaps in current financing. However, the government would also invest developmental dollars for preventive programming, but they would only be required to sustain the funding if tangible (and intangible) outcomes were achieved. The formula is expected to be more complex, but it permits the development of an array of diversified and flexible services that are tailored to the specific needs of child and family services agencies across Canada.. Funding would be tied to four levels in terms of "capacity to implement". There would be national overview of the program, but it would be managed by existing local authorities that set their own standards.

Under this program, First Nations Child and Welfare Services agencies are given funding options, as follows:

Level One: Agencies have the opportunity to apply for special developmental funds in order to complete a needs assessment in their communities, and to prepare a strategic plan and budget around the different levels of preventive programming. Staff at the local managing authority would assist in giving advice during the planning process, as well as providing some training of the workforce in order to implement a preventive agenda. Non-participating agencies remain at Level One, but they would be encouraged to raise their capacity level. Scale of operations is also a significant concern. Even with the financial incentive of developmental funds, some agencies with smaller scale operations will have difficulty in moving forward to the next capacity level of implementing preventive programs. These agencies will likely require extra funding, which is specifically dedicated to improving their scale capacity.

Level Two: Following the use of a developmental grant, the agency receives additional pilot funding, which makes possible the implementation of the preventive services and programs that were outlined in the strategic plan. Agencies would not be required to implement programs all at once. Pilot funding could be allocated incrementally based on a priority list of service needs, as outlined in the strategic plan. This recognizes that agencies have diverse needs in terms of programming, as well as priorities in execution. Implementation would have to be successfully achieved before receiving sustained program funding. For instance, is the agency doing what it said it would do? A quick evaluation by staff at the managing authority could determine whether the agency has earned the next stage of sustained funding for the implemented programs. Subsequently, formal evaluations would take place every 3-5 years, as is the current practice.

Level Three: The agency receives a sustained increase in their funding level based on preventive programming initiatives that were implemented in Level Two and as proposed in the strategic plan. The preventive services are funded over and above the minimum statutory services in the funding formula. Presumably, the maintenance

budget should be declining for agencies that operate at Level Three. In addition, there is an option to access further developmental funding for any innovative projects that the agency wishes to explore. This would be done through a similar proposal process and pilot funding.

Level Four: An exceptional amount of programs/services are provided in First Nations communities, based on a five-year plan. A type of award system, with financial compensation or non-pecuniary rewards to management and staff would be implemented for those agencies who achieve a Level Four capacity to implement.

While this option is less easily translated into a dollar figure for prevention, the idea is that different bundles of prevention programs would be accessed by agencies at different development levels. If there were interest in this approach, the bundles could be more clearly specified and dollar amounts attached.

CONCLUDING REMARKS

Drawing on the above, we can make the following statements;

1. There is a strong case for putting resources into prevention
2. There is a significant literature on the types of preventive measures that have been attempted and there is knowledge of what might or might not work in different circumstances.
3. The returns to successful prevention programs are huge, both in terms of savings in agency costs but also in terms of broader societal savings.
4. The current INAC approach to funding does not adequately provide for prevention and, may even systematically discourage it by underfunding basic operational activities.
5. Some First Nations agencies have, nonetheless, managed to implement a variety of preventive programs with remarkable success. Sometimes this has been accomplished through the diversion of Maintenance dollars under a block funding arrangement.
6. The use of maintenance dollars for this purpose is subject to uncertainty, and block funding is, as well, not for all agencies.
7. Separate provision should be made for prevention funding.
8. This could be based on a team building approach, linked to children in care and/or families receiving treatment, or it could be based on a progressive accreditation process using the services of the First Nations Child and Family Caring Society or some other First Nation central agency set up for this purpose.
9. Whatever the funding approach, prevention activities must be encouraged and there is much successful First Nation experience to draw upon.

[3] Flette (2004) has reported that, in Manitoba, 2004-5 funding cuts to FNCFS are roughly 8%, which amounts to a loss of one month's worth of funding, even though the number of children entering formal care is on the rise. The analyst proposes that the occurrence of reduced funding to First Nations agencies is a countrywide phenomenon (p.4).

[4] Placements are generally made based on mainstream rules and requirements as determined by provincial legislation.

[5] Many of these issues were also raised in the minutes of the meeting (entitled "Parking Lot Issues") of Executive Directors at First Nations Child and Family Services agencies in Manitoba, in September 2002. Flette (2004) also identified several of these funding challenges, which are often based on narrow interpretations of the treasury board authorities, as to which costs are considered "anomalies" from the approved expenditures in the policy manual. A further source is the "Overview of Social Anomalies", which is prepared by the treasury board authorities of Indian and Northern Affairs Canada (INAC 2003).

[6] See Shangreaux (2004) for a comprehensive discussion of least disruptive measures statements that are found in Provincial and Territorial Legislation. The analyst states, "The concept of "least disruptive measures" not only reflects best practice in social work it is also embedded in provincial and territorial child welfare legislation". However, the types of services constituting least disruptive measures are not always clearly identified in the various provincial legislations.

[7] The treasury board authorities keep track of expenditure variances between the national policy manual and actual agency practices, but to date such anomalies have not been funded.

APPENDIX A: DEFINITIONS OF COST-BENEFIT TERMS

Cost-benefit analysis (CBA) has been a widely utilized evaluative tool for a variety of public projects. In Canada, the first cost-benefit guide was developed for the government in 1961[1]. Later, a revised Treasury Board publication outlined the principles of CBA in the following:

"Benefit-cost analysis is a method of evaluating the relative merits of alternative public investment projects in order to achieve efficient allocation of resources. It is a way of identifying, portraying and assessing the factors which need to be considered in making rational economic choices. It is not a new technique. In principle, it entails little more than adjusting conventional business profit-and-loss calculations to reflect social instead of private objectives, criteria and constraints in evaluating investment projects" (Canada, Treasury Board, Benefit-Cost Analysis Guide, March 1976).

There have been several approaches to CBA in recent decades, from both program evaluation and countrywide societal perspectives. One of the major differences in the many published cost-benefit studies is how they vary in their points of view for placing money values on society's resources. Some studies estimate exclusively the fiscal impact to the government or, alternatively, the private costs to individuals. Other studies examine costs to the whole of society, including those costs that are imposed on the community. The current analysis considers the impact of a variety of program alternatives on fiscal expenditures. Therefore, it takes a program evaluation perspective.

The underlying principle in cost-benefit analysis is the notion of economic costs as opportunity costs. All of society's resources may be used in other most highly valued alternative ways. When society makes a choice about the uses of its scarce resources or its delivery of services, it also sacrifices the positive benefits or opportunities obtained by using the resources in some other way. For example, society's expenditures on police investigations and law enforcement, including human efforts in these activities, pulls resources away from preventive activities, such public education about drinking and driving or speeding. The latter alternatives may have resulted in other valuable and gainful societal outcomes. This notion of giving up one thing to get something else underlies economic cost analysis and, in economic terms, it is defined as an 'opportunity cost' (Levin and McEwan 2001).

Inflation, Net Present Value and the Discount Rate

Inflation factor: this is an adjusting factor to economic cost analysis because the value of money fluctuates over time due to increases (and sometimes decreases) in the general price level of goods and services in the economy, as well as wages in the labour force. These periodic adjustments to the value of money are referred to as nominal dollar changes (i.e. costs unadjusted for inflation). An inflation adjustment removes the price level effects by converting economic values into real dollar units, in other words, constant purchasing power over time. The costs of all future years are adjusted to the price level of a specific base year. The most widely used measure of inflation is the Consumer Price Index (CPI) (Levin and McEwan 2001).

Net Present Value (NPV): when comparing costs versus benefits over a period of time, a dollar's worth of expenditures today is worth more than the value of a dollar at some future date. This is because an invested dollar today will earn interest income. Put differently, any deferred program costs to future years involves lower real resource costs to society. If the costs and benefits extend over a number of years, the time value of money is adjusted together with the inflation factor (constant purchasing power). A present value calculation accomplishes this task by using a discount rate. It converts the value of program benefits and costs in the future to a present value, in order to compare them to the current or present costs (Levin and McEwan 2001; Nas 1996).

Discount rate: this is a type of interest rate that is used for the net present value calculation, and its value depends on the viewpoint under examination. For private outcomes, a standard approach is to use the market interest rate because it reflects a return to private savings or a bank loan, in other words, the consumer's opportunity costs of consumption versus

savings. From the state's narrow viewpoint, the cost of government borrowing is an appropriate discount rate. Broader societal effects are adjusted using a social discount rate which, in Canada, has been specified by the government's Treasury Board to be approximately 10%, a rate that reflects private firms' opportunity costs of investment (Levin and McEwan 2001; Canada: Treasury Board of Canada 1998).

APPENDIX 1

Best Practices In Primary, Secondary And Tertiary Prevention Work (Including Least Disruptive Measures)

Introduction

This paper reviews the literature on best practices in primary, secondary and tertiary prevention work, including least disruptive measures in preventing a child from coming into formal care. Much of the existing body of Canadian research in the area of child welfare proposes that First Nations Child and Family Services agencies are increasingly aware of a need for alternative ways of conceptualizing the delivery of services to families in their communities. For instance, more holistic, family-centered and family-preserving approaches within a community-building framework and which protect the integrity of cultural traditions are seen as integral to the provision of child welfare services (McKenzie and Flette 2003; Blackstock 2003).

Despite these common understandings, First Nations communities encounter significant challenges in supporting family-centered approaches, as well as targeting proactive preventive initiatives, in the face of substantial inequities in access to the critical financial resources which would redress a multitude of issues in service delivery needs (Blackstock 2003; Shangreaux 2004). The relevance of inadequate funding is that programming practices in child welfare are often informed by reactive policy responses to an enormity of crises-related interventions and, thus, reflect incongruency with the key goals of redressing some of the systemic issues. This includes the need for early intervention and preventive measures, the lack of which thwarts capacity building and family wellness in First Nations communities (Kufeldt 2003; McKenzie 2002; Shangreaux 2004). Consequently, most of the research included in this review identifies glaring gaps in proactive preventive service provision within the majority of First Nations communities.

Primary, Secondary and Tertiary Prevention

Analysts generally concede that the notion of prevention implies a continuum of child welfare services that promote healthy community living and, ultimately, fewer children from coming into formal care. However, the continuum of care is formally defined as falling into the three broad classifications of prevention: primary, secondary and tertiary. Preventive measures can include participation from the community (Elders), institutional (medical or educational systems) or social strategies involving family and individual, or any blend of these approaches. For example, a program aimed at decreasing the risk of FAS/E for the children of pregnant adolescents who smoke, drink or engage in substance misuse might combine medical services, health education in a school program, elder counseling, and participation in a support group (Health Canada 1997).

Prevention actions are often effective on several levels. For instance, consider the case of family training in behavioural management techniques for a special needs child in the home. The tools acquired by parents will likely apply to other children in the family. There may be intergenerational effects, as older adolescent children learn how to deal with the behavioural and learning issues of younger siblings, thus providing them general parenting tools to deal with their own children in future. In this way, a secondary prevention effort that is dealing with a specific risk factor overlaps with a primary prevention effort aimed at future generations.

Though there is interplay of the various types of prevention and the members of the population who benefit from such strategies, the current review is framed in terms of delineating into separate classifications the primary, secondary and tertiary prevention initiatives that are given attention in the literature.

There is also much discussion in the research regarding a "resource gap" in the area of prevention (McKenzie 2002). However, it is also proposed that none of the three levels of prevention can achieve maximum effectiveness unless key social issues are addressed through development-enhancing programming and funding directed at strengthening the physical and social infrastructures of the First Nations Child and Family Services agencies and their communities (Shangreaux 2004). Only through adequate financial resources and a community-building approach can general developmental strategies dealing with poverty, inadequate housing, addictions and violence be redressed.

The current literature review is structured to provide discussion of the range of prevention services that are considered necessary by service providers and other analysts in the social work field, in terms of best practices from a least disruptive measures approach. Tables 1-4 summarize an array of program categories that are aspired to in the current research within four broad classifications – primary, secondary and tertiary prevention initiatives, as well as general developmental strategies. Several of the programs listed in these tables, which range from an emphasis on wellness at one end to intervention measures for existing child maltreatment at the other end, have been proven effective in some First Nations communities and, thus, constitute best practices in child welfare service delivery (McKenzie and Flette 2003; MacLeod and Nelson 2003).

Primary Prevention

Primary prevention, sometimes referred to as "universal prevention", is delivered to the general population as opposed to an identified high risk group. As a proactive measure, it is focused on lessening the incidence of child abuse in a society by preventing risk factors which bring about family violence to begin with (MacLeod and Nelson 2003; Shangreaux 2004). Progress in primary prevention initiatives would include the substantial reduction or the eradication of the significant factors that lead to child maltreatment.

A program that is directed at preventing prenatal alcohol consumption is an example of primary prevention and it substantially reduces or eliminates any risk of birth effects, such as FAS/E. As further example of primary prevention from a culturally-based perspective, previous research has observed that what is considered necessary in

family wellness initiatives is a focus on teaching traditional parenting styles within a culturally-appropriate framework (which may also vary by band/tribe) (Cross 1986; Coleman et al 2001), in particular, as it pertains to the engagement of Elders in the process, the oral tradition and the use of the medicine wheel. Parents who are offered such services would learn what their culture tells them about how to be an effective parent. Examples may include a non-coercive styles and little emphasis on developmental timing. Traditional practices often avoid physical punishment and domineering or "take charge" parenting styles, which are superceded by hugging, praising and being emotionally available to the children (Coleman et al. 2001; Cross 1986).

Table 1 lists a review of various literature sources in the child welfare research, which identify recurring themes in what are best practices in primary prevention, as well as some of the existing innovative initiatives in community-based strategies.

**All of the literature emphasizes that such programming, which supplements the child welfare system, must integrate cultural practices and collaborative working relationships with the communities.*

Table 1: Literature Review of Best Practices in Primary Prevention

Type of Primary Prevention Program* *(proactive support, education and resources directed at the general population)*	**Literature Sources or Existing Programs** *(which are considered effective as best practices)*
Building parenting capacity: Public education campaigns that promote effective parenting, healthy pregnancies (avoiding alcohol, etc.); use media interventions, speaking engagements; **Resource materials development related to parenting:** Newsletters promoting Aboriginal spirituality and an oral tradition in child-rearing practices;	Blackstock (2003); Cross (1986); Kufeldt (2003); MacLeod and Nelson (2003); McKenzie and Flette (2003): medicine wheel framework; Resource example: *Parents* magazine; Shangreaux (2004);
Outreach and prevention services related to parenting capacity: Parent education programs and support groups; family planning programs; referral services; prenatal classes and home visits; Developing parenting training methods on the basis of traditional practices and using Elders in these processes of "self-conscious traditionalism";	Blackstock (2003); Brown et al. (2002); Cross (1986); Fairholm (1997): Canadian Red Cross workshop -- "Walking the Prevention Circle"; McKenzie (2002); MacLeod and Nelson (2003) – emphasis on multi-component programming; Shangreaux (2004); WRCFS 2005-6 Service Plan: Welcome Baby Programs;
Males and parenting: Programs that engage males in the parenting process e.g. group therapy interventions that incorporate traditional Aboriginal practices, ceremonies and, in particular, child-rearing values; Elder involvement;	Dion Stout (1997); Dion Stout and Kipling (1999); McTimoney (1993);
Public awareness campaigns – FAS prevention: Fetal Alcohol Effects/Syndrome (FAE/FAS) prevention using an integrated approach which also addresses some of the social issues in the communities;	Bennett (2002); Dion Stout (1997); Health Canada (1997); McKenzie (2002); WRCFS 2005-6 Service Plan: Addictions Education Workshops;

Table 1: Literature Review of Best Practices in Primary Prevention

Public awareness campaigns – How to report suspected child abuse/neglect; Public awareness re: domestic violence; Awareness around risk factors re: child offending behaviors; Child abuse and neglect awareness;	Dion (1999); Health Canada and Assembly of First Nations (2003); Longclaws et al. (1994); Shangreaux (2004); WRCFS 2005-6 Service Plan: Family Violence Education Workshops; Child Abuse and Neglect Awareness Week activities;
Public awareness: Community meetings; workshops on community needs (this overlaps with a developmental strategy);	McKenzie (2002);
Resource materials development: Relating to suicide prevention; Culturally sensitive resources re: FAS/E	Royal Commission on Aboriginal Peoples (1995); Health Canada and Assembly of First Nations (2003): suicide prevention; Health Canada (1997) – FAS/E;
Family Support Initiatives: Family resource centers intended to strengthen the ability of families to access existing supports and resources; life skills (budgeting, taking care of a home, self-care, etc.); marriage preparation workshops; family activity nights; family camps;	Shangreaux (2004); WRCFS: 2005-6 Service Plan;
Family Support Initiatives - **Education:** School-based prevention efforts around child maltreatment; Availability of pre-school programs and resources; **Parents:** Engaging parents in the education system and prevention issues early in the formative years (e.g. parent volunteer initiatives) re: substance/alcohol use; **Children:** Prevention/intervention in the primary school years (the formative years) re: substance abuse, sexual abuse, self-esteem/confidence building, etc.; Babysitting training courses for adolescents;	Budgell and Robertson (2003): Aboriginal Head Start Program; First Nations Education Steering Committee (2001): "A Handbook for Parents" resource; Gfellner (1991); MacLeod and Nelson (2003); Pancer et al. (2003): Highfield Community Enrichment Program in Ontario (includes a home visiting program) – annual per child cost $1,300; Resolve and CS/Resors (2004): Ndaawin coloring and activity book as a resource for the prevention of sexual abuse;
Nutrition programs in which traditional foods are included; **Smoking Cessation** programs;	Wright et al (2005)
Building youth capacity through prevention efforts targeting children and adolescents (healthy activities): Recreation programs, summer programs, sports, camps, etc. for children, including those with special needs; "Back to the Land" outings; Culture and language programs; life skills;	First Nations Center (2004); Durst et al.(1995); Trocme et al. (1998); Shangreaux (2004); Wright et al. (2005); WRCFS: 2005-6 Service Plan: Summer Program for Youth (workshop and activity-based);
Culture: programs related to the development of cultural identity, also taking account of the diversity in Aboriginal culture; youth awareness of traditional values;	Wright et al. (2005);

Secondary Prevention

Secondary prevention, often referred to as "selective prevention", is also a proactive strategy which more selectively targets an existing risk factor or high-risk families, and it takes measures to lessen the threats of child maltreatment with early intervention. Such initiatives are focused on bringing under control any harm or distress that may have been done before the secondary intervention started, thus, the onset of any negative effects may be reduced rather than being completely prevented (MacLeod and Nelson 2003; Shangreaux 2004).

For instance, a child who at risk for neglect or abuse can go to a neighborhood drop-in center and have access to an individualized support network of youth workers, in particular, given her dysfunctional home circumstances. Aside from being a safe place to go, the idea behind the prevention agenda (i.e. the drop-in center) is to change the youth's reference group, to provide positive role modeling and to deal with the social circumstances that make the youth more apt to eventually engage in drug and alcohol misuse or to become an offender (Resolve and CS/Resors 2004).

Other proactive secondary level strategies that have been proven effective include home visitation, which begins in the prenatal period or at birth. In their study, McLeod and Nelson (2003) found encouraging results from this type of early intervention, the positive effects of which superseded other crisis-focused intensive home-based programs that intervene in existing child

Table 2: Literature Review of Best Practices in Secondary Prevention

Type of Secondary Prevention Program* (resources, support and education directed at high-risk families and youth*)	Literature Sources or Existing Programs (which are considered effective as best practices)
Building parenting capacity: parent education programs/ workshops and support groups for at-risk groups: e.g. adolescent lone-parent mothers in high schools or in addictions treatment programs; **Programs for parents with special needs children;** **Smoking cessation programs;** **Family strengthening** programs that deal with challenges of parenting: parent education workshops to develop skills around the needs of their children; **Household management** workshops;	Bopp (1985); Public Health Agency of Canada -- Nobody's Perfect Program & Resource Kit; Shangreaux (2004); Wright et al. (2005); WRCFS 2005-6 Service Plan: Teen Parenting courses; Early Identification, intervention and support for pregnant women who are affected by alcohol or family violence; Parenting Training programs (Positive Indian Parenting; How to Talk So Kids Will Listen); Child Development Training Workshops; Household Management Skills Training;
Family support: Day Care, Parent aide, respite services to families at risk (lone-parents, multiple children, etc.); Support groups for men and women (co-ed adult groups);	WRCFS 2005-6 Service Plan: Healing and Sharing Circles; Women's Circles: Survivors of Sexual Abuse;
Family support: Resource centers where information is disseminated: families can access books, pamphlets, videos on family issues, etc.; **Community drop-in centers** for families where they can engage in healthy family activities; **Ongoing seminars/workshops** on issues, such as child abuse, sexual abuse, historical grief; colonization and residential schools, family violence;	Shangreaux (2004); WRCFS: 2005-6 Service Plan: 12-week healing program for women who were child victims;

* *All of the literature emphasizes that such programming, which supplements the child welfare system, must integrate cultural practices and collaborative working relationships with the communities.*

Table 2: Literature Review of Best Practices in Secondary Prevention

Type of Secondary Prevention Program* (resources, support and education directed at high-risk families and youth*)	Literature Sources or Existing Programs (which are considered effective as best practices)
Home visiting programs for families with children at risk: Support and assistance to women in the pre-and-postnatal periods; prenatal nutrition; in-home support for children and other family members;	MacLeod and Nelson (2003); Shangreaux (2004); WRCFS: 2005-6 Service Plan;
FASD prevention for at risk women/teens	Health Canada (1997); WRCFS: 2005-6 Service Plan: Reclaiming our Voices Project and Annual Conference (Health Canada);
FASD intervention: Early diagnosis and intervention services as it pertains to child developmental issues (special needs; FAE, etc.)	Bennett (2002); Health Canada (1997); Wright et al. (2005); WRCFS: 2005-6 Service Plan;
Support for children with special needs (FASD intervention): **Respite and other child care services**, as well as better financial support for families, including foster families with special needs children (recreation, lessons); (E.g. behavioral and learning disabilities; FAS); **Community-based therapeutic services** (child development counselors, etc.) **Specialized resources for youth with greater needs;** training sessions for teachers and other community helpers;	Dion Stout (1997); Health Canada (1997); McKenzie (2002); Shangreaux (2004); WRCFS: 2005-6 Service Plan: Training sessions for teachers with FAS/E children in the classroom; training for community helpers; Wright et al. (2005);
Intervention services for youth with disabilities (special needs) or complex needs when they reach adulthood;	Health Canada (1997); Wright et al. (2005);
Building youth capacity: Neighborhood drop-in centers where children can go when home circumstances are difficult; children's groups; **Pre-school programs** for at risk children; training teachers in schools;	Budgell and Robertson (2003): Aboriginal Head Start Initiative; Second Step Program (training for teachers and parents); Resolve and CS/Resors (2004) – Ndaawin Program, Winnipeg; WRCFS: 2005-6 Service Plan: Children's Group;
Support to girls who have been sexually abused; Suicide prevention;	Health Canada and Assembly of First Nations (2003); Royal Commission on Aboriginal Peoples (1995); WRCFS: 2005-6 Service Plan: 13-week adolescent girls – survivors of sexual abuse group; Suicide Prevention Workshops for Teens;
Youth employment and life skills programs	WRCFS: 2005-6 Service Plan: Vision Seekers (for youth – ages 19-25);
Anger management workshops for youth	WRCFS: 2005-6 Service Plan: Anger Management Training for Teens;
Risk assessment tools development re: suicide prevention for youth;	Health Canada and Assembly of First Nations (2003); Royal Commission on Aboriginal Peoples (1995);

* *All of the literature emphasizes that such programming, which supplements the child welfare system, must integrate cultural practices and collaborative working relationships with the communities.*

maltreatment cases (i.e. tertiary prevention). Their results suggested that, while tertiary prevention is a crucial service, "the earlier the intervention the better" as it pertains to positive child outcomes (p.141).

A further secondary prevention example of family support and parenting education measures for at-risk families is the Nobody's Perfect Program, a Health Canada developed and funded parenting program (usually 5-6 weeks long) and resource series for parents of children from birth to five years of age. The program is also offered on an individualized basis. The resource kit of five user friendly books -- Safety, Parents, Behavior, Body, Mind -- covers family violence and abuse related topics, such as children's behavioral issues, parent's self-care and injury prevention. This resource is distributed through an array of other community-based programs, such as the Aboriginal Head Start Programs. This strategy's effectiveness as a best practice in prevention is evident in evaluation and impact studies, as well as the continuing high demand for the program and its resources since its inception in 1987 (Public Health Agency of Canada: Online. Available at: www.phac-aspc.gc.ca).

Tertiary Prevention

Tertiary services in a least disruptive framework, often referred to as "indicated prevention", encompass family support and family preservation or rehabilitative services that enable at risk children to remain at home (Trocme et al. 1998; Shangreaux 2004). Tertiary prevention is implemented when the conditions of child maltreatment already exist (i.e. there is demonstrated evidence), therefore, such interventions are viewed as reactive measures (MacLeod and Nelson 2003; Shangreaux 2004). The idea is to minimize the adverse conditions of serious harm to the child while stressing the preservation of the family. Heavy emphasis is placed on tertiary prevention services in most of the literature. For example, tertiary intervention in the case of a maltreated special needs child

Table 3: Literature Review of Best Practices in Tertiary Prevention –

In the context of family-centered preservation and stabilizing services, such as the Homebuilders (HB) and Wrap-Around Models (WA)

Type of Tertiary Prevention Program* *(this often involves rehabilitative services directed at families where maltreatment has occurred: case management, counseling, education, etc.)*	**Literature Sources or Existing Programs** *(which are considered effective as best practices)*
HB: Home-based intensive support services: Shorter term intensive family preservation and stabilization protective services with 24-hour availability of trained mental health staff; crisis counseling services; Multidisciplinary case planning/assessments with the family, including regular visitation programs; **A coordinated team approach** to service provision through integrated services, including after hour services, in more complex cases when the removal of a child is possible – a network of services: social workers, foster parents, health professionals, teachers, kinship system, etc.;	Blackstock (2003); MacLeod and Nelson (2003); McKenzie (2002); Shangreaux (2004); Trocme et al. (1998); WRCFS: 2005-6 Service Plan: Homemaker and Parent Aide Services; case planning with families; McKenzie and Flette (2003); Kufeldt (2003): the idea of "corporate parenting" – *Looking After Children* was designed in this way.
HB: Rehabilitative services that build parenting capacity: More highly intensive parental support – in-home, groups and training that focuses on alternative techniques from current negative practices for effective parenting; child management skills, etc.	Blackstock (2003); Coleman et al. (2001); MacLeod and Nelson (2003); Shangreaux (2004); Trocme et al. (1998);
HB: Rehabilitative services: Parent mentor programs, e.g. non-abusive families could act as role models and provide support (community helpers social support system); family violence treatment programs;	Flette (1999); Green (1996); MacLeod and Nelson (2003); McTimoney (1993); Shangreaux (2004);

Table 3: Literature Review of Best Practices in Tertiary Prevention –

In the context of family-centered preservation and stabilizing services, such as the Homebuilders (HB) and Wrap-Around Models (WA)

HB: Rehabilitative services: Family supervision services; mental health intervention services for children who have been abused, instilling cultural and spiritual practices;	Blackstock (2003); Shangreaux (2004); Trocme et al. (1998); Wright et al. (2005); New Directions, Winnipeg: Families Affected by Sexual Assault Program (FASA);
Respite services (child care) to reduce family stress; emergency care; recreational support;	Shangreaux (2004); Wright et al. (2005); WRCFS: 2005-6 Service Plan;
WA: Family reunification services: Strengthen the wider family network (grandparents, non-relative community helpers, etc.); keep children in their own communities and culture approach; support to children who are reuniting with extended family; Preventing discontinuity in placements and workers assigned to cases; Intensive and long-term support to families/children that are reuniting after children have been placed in care;	Blackstock (2003); Brown et al. (2002); Fox-Decent (1993); Jones (2003); Kufeldt (2003) – notion of a "seamless continuum and continuity of care"; McKenzie (1999); Shangreaux (2004); Trocme et al. (1998); WRCFS: 2005-6 Service Plan: comprehensive transition case planning (team approach), in-home family/individual counseling; one-to-one parental skill development, etc. Elder services to youth returning to their kinship systems;
Family Support: Services that help remove an abusing parent from the home (and support them in other ways, e.g. addictions services), not the child, in particular, if there is a non-abusing parent in the home; Drug and alcohol treatment referral; Treatment Support Services: individual, family, group counseling and family conferencing; life skills training; (wo)men's/co-ed groups dealing with family stressors; post-treatment support; Programs in dealing with sexual abuse (holistic healing models); women's support groups;	Blackstock (2003): Hollow Water First Nation; McKenzie (2002): Miikanaa Centre for male sexual offenders; Daily (1987): Awareness Wheel approach for victims and perpetrators of sexual abuse; Green (1996) ; McKenzie and Flette (2003); WRCFS: 2005-6 Service Plan: Men's Group to deal with issues of family violence (26-week program for men who batter); Anger Management workshops; Men's Healing Circle; Women's Sharing Circle; Survivors of Sexual Abuse/Domestic Violence groups;
Culturally specific addictions recovery programs for parents, including residential treatment and post treatment support (e.g. treatment for men who batter);	Wright et al. (2005); WRCFS: 2005-6 Service Plan: Women and Addictions recovery circles; Mandatory treatment for men who batter;
Youth Services	
Treatment centers or special schooling programs for children with behavioural issues, also located in the local communities;	Health Canada (1997); Wright et al. (2005);
School partnerships: in-school counseling support for at risk children; Programs dealing with child sexual abuse; anger management; treatment for adolescent boys who are at risk for sexually offending;	WRCFS: 2005-6 Service Plan: 13-week adolescent girls – survivors of sexual abuse group; Anger Management Training for Teens; Miikaana program (sexually offenders);
Services relating to out-of-home placements: wrap around perspective involving extended family, elders, leaders and other community members; loss and grief counseling; access to trained counselors for child and foster families;	Brown et al. (2002); Carrier-Laboucan (1997); Cross (1986); McKenzie (2002); WRCFS: 2005-6 Service Plan;

Table 3: Literature Review of Best Practices in Tertiary Prevention –

In the context of family-centered preservation and stabilizing services, such as the Homebuilders (HB) and Wrap-Around Models (WA)

Therapeutic Foster Home Program	WRCFS: 2005-6 Service Plan: GGK program;
Residential prenatal and postnatal programs for adolescent mothers; adolescent pregnancy supports; short-term emergency receiving services on reserve (placement beds, etc);	Ma Mawi Wi Chi Itata Centre (Winnipeg): residential program for teens; McKenzie (2002) & WRCFS: 2005-6 Service Plan: Oshki-ikwe facility; Piikaanijii home;
Independent living programs for youth leaving care (> age 18), i.e. transition services related to life skills; employment counseling; training; support to prevent youth from becoming offenders; healthy recreation opportunities;	Biehal et al. (1995) study in England of treatment and control groups showed mixed results in terms of differences in the outcomes for the youth (cited in Davies 2003); Kufeldt (2003); McKenzie (1999);
Programs dealing with youth addictions	WRCFS: 2005-6 Service Plan: Youth Addictions – Co-ed Gym nights;

* *All of the literature emphasizes that such programming must integrate cultural practices and collaborative working relationships with the communities and kinship systems.*

would entail a range of overlapping services to help minimize the adverse effects of these circumstances. Programs may include medical procedures, social supports for the child and guardians, as well as educational efforts.

The most cited example of family-centered tertiary services is the Homebuilders' Model, which is the main family preservation approach, as it pertains to mainstream approaches. Such a model targets families in which the children are at risk of being placed in formal care arrangements, and it tailors home-based services to their specific needs. Traditionally, in this model, social workers and family support workers have smaller but more intensive caseloads (Shangreaux 2004; MacLeod and Nelson 2003). However, this model is not without criticisms in the literature (Kufeldt 2003: 276-7), and Coleman et al. (2001) propose that Aboriginal ways of helping can remedy several of the issues that result in the diminished effectiveness of these programs as it pertains to evaluative outcomes.

For instance, the concept of a normal and healthy family in Aboriginal culture, which includes a support network of extended family and community members, is inherently incompatible with the mainstream paradigm of the nuclear family structure (Blackstock 2003; Cross 1986). Coleman et al. (2001) argue that, in Aboriginal culture, the notion of an in-law may be nonexistent and elders or neighbors might be considered a part of one's family (p.55). Likewise, a child whose biological parents die is not perceived as an orphan (Cross 1986). Thus, family-centered services when seeking options in child placements entail working with relatives who have had successes as parents (i.e. aunties or grandparents) and who parent from a cultural appropriate perspective (Coleman et al. 2001).

There are also many tensions resulting from the fast-moving pace of Homebuilders programming as it pertains to expectations of results from the intervention. Brown et al. (2002) refers to this as a "drive-through" approach (p.143). One suggested remedy is that funding has to be adapted to looser time constraints, in other words, slowed down and focused on building relationships from a client-directed perspective. In their meta-analysis of child welfare programs, MacLeod and Nelson (2003) argue that "program intensity and longer program duration" are key success factors in home visitation programs (p.141).

Hence, from this viewpoint, agency workers should not be expected to enter a home and

resolve the family's issues in any meaningful way within one month's time. Services must be slower-paced, client-directed and flexible to building relationships, as well as not interfering in a huge way in order to ensure congruency with the family's culture and belief system (MacLeod and Nelson 2003). One cited example of family empowerment in the literature is that culture may determine how a family resolves its disagreements; hence, respect must be given to these traditions (Coleman et al. 2001).

Since children are viewed as a gift to the community, as opposed to individuals or couples, the literature emphasizes the notion of forming a circle around the family in case planning, which includes relatives in foster care placements, Elders and other community members (Blackstock 2003; Coleman et al. 2001; Cross 1986). One example of a natural helping system which must be reflected in programming initiatives is the Wrap Around model, in which a multidisciplinary team approach to problem-solving combines formal and informal services, including collaborative "community-based services; individualized services; cultural respect; families are partners; flexibility in funding…" (Shangreaux 2004: 18). Coleman et al. (2001) argues that the "helping process involves multiple layers" of working relationships (p.65), with a key objective being to enhance the capacity of a natural helping mechanism or network. There is much emphasis in the community-based research that a continuum of services, as opposed to a single-worker approach, is considered necessary to carry out a family centered services approach with a least disruptive measures perspective (Coleman et al. 2001; Shangreaux 2004), Coleman et al. (2001) also propose that programs offered must involve spirituality interventions, such as sweats, smudges and pipe ceremonies, as a few examples.

In sum, there is general consensus in the research that family preservation services can only really work effectively as a collaborative effort between formal services and community partners: Aboriginal healers, Elders, other community-based services and extended family. The single-worker approach within rigid time frames simply does not work (Brown et al. 2002).

Table 4: Developmental programming directed at strengthening the infrastructure of the First Nations Child and Family Services agencies and their communities (i.e. a community-building approach)	**Literature Sources or Existing Programs**
Socio-economic issues around income and employment and the future of the youth: Community economic development projects to combat poverty; Life-skills training for at-risk children; vocational assessments; Create part-time jobs and job placement training for at-risk adolescents in order to nurture connections to the labour market/schooling; Work towards a long-term goal of training youth in various professions, such as psychology, speech therapy, family violence support workers, social work, etc.	Chapman (1991): family violence worker training program at the Vancouver Native Education Centre; Early labour market connections programming, such as the Urban Green Team, in Winnipeg (which is a culturally-based strategy); Charter et al. (1994): Career counseling for Aboriginal youth pilot program; Durst et al.(1995); McKenzie and Flette (2003): Vision Seekers Program; the Mino-Bimaadizi Project; McLeod and Nelson (2003); Wright et al. (2005);
An ecological approach, which considers other socio-economic issues that create stressors in family functioning – lack of housing and overcrowding in existing housing; lack of food banks; addictions; Unsafe drinking water and sewage treatment; Lack of women's shelters, culturally-based domestic violence counseling and victim/perpetrator support programs; need for better policies re: domestic violence that acknowledge the issues and integrate men in proactive initiatives;	Aboriginal Justice Implementation Commission (2001); Chapman (1991); Dion Stout and Kipling (1999); Dion Stout (1997); Health Canada (1997); Durst et al.(1995); Kufeldt (2003); Longclaws et al. (1994); McTimoney (1993); Canadian Incidence Study on Reported Child Abuse and Neglect (Trocme et al. 1998, p.41); Wright et al. (2005);
Cost-of-living recovery on expenditures which targets the problem that some goods and services may be more expensive to transport into remote communities	Blackstock (2003); Wright et al. (2005);
Developmental approach/resources to address the need for better service infrastructures and relevant programming in First Nations communities/remote areas: Create advisory committees, which would form community-based linkages in terms of the voluntary sector; emphasizing a collaborative service provision focus that builds local capacity and support networks – working with health services, band controlled programs, local schools, etc. (idea is to keep youth in the community); Special focus on the problems of isolation of reserve communities from outside community-based services and coordinating/networking of service provision;	Blackstock (2003); Coleman et al. (2001); Irvine (2004); McKenzie and Flette (2003); McKenzie (2002); Nadjiwan and Blackstock (2003); Wright et al. (2005);
Developmental approach/resources for youth capacity building: Create advisory committees of Elders and young members of the community, which would develop strategies to involve youth in working on solutions to broader social issues in their communities – adolescent drug and alcohol misuse, community-driven approaches to suicide prevention; ways of implementing traditional teachings, healing, ceremonies, drumming, etc.; mentoring programs; healthy recreation activities; Coordinated community responses to child maltreatment issues;	Bennett (2002); Bopp (1985); Coleman et al. (2001); Durst (2000); Durst et al.(1995); Health Canada and the Assembly of First Nations (2003): suicide prevention; Royal Commission on Aboriginal Peoples (1995): suicide prevention; Shangreaux (2004); WRCFS: 2005-6 Service Plan;

Developmental approach/resources to build volunteer capacity in communities: Ongoing work on expanding a community-based volunteer sector within reserve communities, perhaps even promoting youth and parents' participation in local capacity building, community helpers volunteer initiatives, etc., also taking account of geographic isolation;	McKenzie (2002);
Developmental approach/resources for internal agency infrastructure: User-friendly training manuals; ongoing funds for staff training and professional development so that an adequate human resource base of culturally-sensitive staff can be realized/maintained; Ongoing re-evaluation of casework techniques and case loads, i.e. planning/assessments/consultation; Training of more specialized social workers (emphasizing a collaborative approach) and focused training for families/foster families in childhood cognitive learning disabilities and behavioral issues (FAS/E issues);	Caring for First Nations Children Society (2002); Cross (1986); Green (1996); McKenzie (2002, 1999); McKenzie and Flette (2003): Children with Special Needs Coordinator position developed a parent support network, educational resources, etc.; WRCFS: 2005-6 Service Plan; Wright et al. (2005);
Adequate resources allocated to the supervision and ongoing support of front-line staff: Parent aides, child support workers, community helpers, teaching homemakers, etc. **Bureaucratic systems:** findings ways to reduce the front-line staff's paperwork needed to fulfill the obligations under the Child and Family Services Act, which create times pressures with regards to casework;	Coleman et al. (2001); WRCFS: 2005-6 Service Plan: sharing circles for community helpers; specialized training for caregivers; Caring for Caregiver Training; Training community helpers to facilitate groups; Training support and respite workers; volunteer recognition activities; McKenzie (1999);
Physical infrastructure issues: wheelchair accessibility; Equipment and supplies for children with disabilities;	Wright et al. (2005); WRCFS: 2005-6 Service Plan;
Targeted funds for the management and administrative structures to support primary, secondary and tertiary prevention initiatives, e.g. MIS systems to reduce staff workloads and expedite information sharing; agency governance issues, such as strategic planning of priorities and regular service plans that involve the community;	Bennett (2002); Durst (2000): Kahnawake Shakotiia'takehnhas (PQ) & Nog-Da-Win-Da-Min Family (Ont.) and Community Services: community consultation projects for social service delivery; Flette (1995); McKenzie and Flette (2003); McKenzie (2002, 1999); WRCFS: 2005-6 Service Plan;
Developing **clear definitions of disability**, for example to include behavioral issues and cognitive learning disabilities; Develop a culturally sensitive resource base and public awareness around issues of disabilities (FAS/E, etc.).	Health Canada (1997); Wright et al. (2005);
Funding research advisory groups and ongoing research, which helps to inform evidence-based policy and practices around prevention (e.g. with a child outcomes focus); Policy development: e.g. take measures to create consistency/coordination in the practices of FNCFS agencies (within reasonable parameters since activities/teams are decentralized); Standardized data collection (comparative statistics) and reporting for research and evaluation purposes;	Davies (2003) – research that is linked into the policy process (p.384); Fox-Decent (1993); Jones (2003) – Looking After Children Model in England – policy rooted in evidence drives and supports the required changes in practices (p.374); McKenzie (1999); Nutter et al. (1995);

Developmental Programming

Best practices in developmental programming would support the design and service delivery (and evaluation) of community-based healing strategies, also tailored to the specific needs and cultural heterogeneity or identity of each community (McKenzie and Flette 2003; Shangreaux 2004; Durst et al. 1995). The basis for this model of practice is the notion that residents in the communities are in the best position to actively participate in dialogue on which solutions are in the best interests of their own communities (Brown et al. 2002; Fox-Decent 1993: 72).

Moreover, analysts argue that many underlying social issues in Aboriginal communities must be addressed on several levels if any type of prevention initiative relating children coming into care is expected to be effective (Shangreaux 2004; Kufeldt 2003; MacLeod and Nelson 2003). The underlying principle in developmental programming is to reinstate natural systems by developing culturally relevant practices in seeking to protect children with a further goal of strengthening the infrastructure of First Nations communities (Blackstock 2003; Cross 1986). Cross (1986) argues that formal child welfare services, including tertiary prevention services, have become the primary model of practice only because "natural systems became less able to protect children" over time (p.286). Development strategies would also improve income and social status by taking account of the wider systemic issues in the community at large.

The types of developmental strategies listed Table 4 are fuelled by deeper and more complex social issues – poverty, unemployment, racism, violence, sexual abuse, addictions and the growing prevalence of fetal alcohol birth effects. Combating many of these systemic issues which impact the entire community is apt to have a more positive impact on prevention strategies, but the enormity of the task is costly to implement and vulnerable to unsustainable financing from government sources.

Conclusion

This paper reviewed the literature on best practices in prevention work, from a standpoint of least disruptive measures in preventing a child from coming into formal care. At the risk of oversimplifying the multifaceted continuum of care in child welfare service delivery, in this analysis, prevention initiatives are distinguished separately into four classifications: Primary, Secondary and Tertiary prevention, as well as Developmental Strategies. Though there has been action on a variety of preventive initiatives within several First Nations Child and Family Services agencies, the glaring obstacle is that financial resources are rarely made available to develop an appropriate inventory of services. Such strategies would better match the philosophy of service delivery which puts the responsibility back on the community by emphasizing intensive family support and cultural connections.

Furthermore, this literature review investigates a range of critical developmental issues in First Nations communities, which are at the core of much child maltreatment – poverty, unemployment, racism, violence, sexual abuse, addictions and the growing prevalence of fetal alcohol birth effects. It highlights the issue that families in distress, as well as the consequent intergenerational outcomes and costs to society, ought to make prevention measures a concern for all Canadians, and not just the responsibility of the First Nations Child and Family Services agencies acting in isolation. In light of these issues, a recurring theme in the literature is that, while reactive or tertiary prevention programs are absolutely needed for families who are presently in distress, it is of paramount importance that the question of sustained financial support be addressed so that proactive primary and second preventive activities, as well as community development initiatives are undertaken in First Nations communities.

CHAPTER 5

Prepared on behalf of:
First Nations Child & Family Caring Society Canada

Written by: Stanley Loo

April 25, 2005

Background

This review of information systems used by FNCFSAs (First Nations Child and Family Service Agencies) is part of the funding formula development project. Costs related to acquiring and maintaining information systems can be substantial and are important data needed for testing the three funding formula options identified in Phase One of the project. It should also be recognized that since information systems cannot be implemented without a viable technological infrastructure in place, accurate cost estimates must be based on all aspects of technology deployed, not just those specific to information systems or databases.

Although FNCFAs vary in their present levels of use of computer technology and information systems, they, like all other organizations across Canada mandated to deliver child protection services, must ultimately have a uniform capability, by means of appropriate computer technology, to operate efficiently, manage and monitor delivery of child protection services, report on service or program outcomes, facilitate service planning, and meet various accountability expectations and standards.[1] Specifically, they must strive to use technology to achieve the following core functions of child welfare agencies:

1. Managing day-to-day office operation, e.g., word processing, accounting, payrolls, newsletters, etc.
2. Managing caseloads, service delivery, and resources.
3. Meeting performance expectations and legislated requirements for accountability management, i.e., ability to quickly generate accurate and current financial reports, caseload reports, and other types of status or ad hoc statistical reports for government departments or regional authorities.
4. Producing performance feedback information for management, and contributing child protection outcomes data to the national project currently underway.[2]
5. Exchanging electronic datasets with external

organizations, such as university research centers, government agencies, and the proposed First Nations Statistical Institute.

The Auditor General of Canada usefully pointed out in their December 2002 report[3] that deploying appropriate computer technology is the only way for First Nations organizations to meet the demanding reporting requirements imposed by federal government departments and to ensure that the data is accurate. Authors of the report were "concerned about the burden associated with the federal reporting requirements." In reviewing the experiences of four First Nations and two tribal councils in Saskatchewan, the report authors estimated that the total number of financial and non-financial reports that a community was required to compile annually for INAC, Health Canada, HRDC and CMHC was between 168 and 202. The federal government acknowledged that the current reporting requirements must be made less cumbersome and less excessive. Among the strategies proposed to streamline reporting requirements were:

- "…make full and efficient use of available technology".
- Building on the positive results of the Government on Line (GOL) initiative, "promote electronic data exchange as a way of doing business with First Nations".

Purpose of Review

This review aims to answer the four questions pertaining to information systems listed in the project proposal, and they are:

1. "What kinds of MIS systems are currently in use by FNCFSA and how do they compare with provincial systems?"
2. "What kind of MIS system is required to meet agency requirements and ensure adequate interfaces with provincial and national data systems?"
3. "What are the costs of developing and maintaining such a system?"
4. "What are the implications for funding formula budget?"

In order to identify practicable computer technology options that would allow FNCFSAs to build the kinds of operational and data capability described above, and to estimate costs, we need to know the present situations, efforts, and technology deployment plans in the agencies. In addition, since FNCFSAs are accountable to their respective provincial governments for service delivery as per provincial child welfare legislation, policies and standards, and, as part of this legislative arrangement, are required to use or contribute case data to provincial information systems, it is equally important to understand the kinds of provincial-agency arrangement in place and the extent to which such arrangements help FNCFSAs to meet their day-to-day operational and management needs. Recommendations regarding suitable information systems must be made on the basis of a balanced understanding of specific situations, needs, issues, and the larger context in which agencies operate.

Methodology

Scope of the Review

Currently there are 119 FNCFSAs in nine Canadian provinces[4], according to FNCCSC (First Nations Child and Caring Society of Canada). Since the 11 Ontario agencies are not included in this project due to a different funding arrangement the Ontario government has with First Nations agencies in that province, a total of 108 FNCFSAs constituted the population for this review. However, we knew that time and budget limitations would not allow us to interview too many agencies. It was therefore concluded that, given the specific purpose and focus of this review, our data collection priority should be to include those agencies that have their own information system. Should resources allow, we would also interview agencies that use provincial systems exclusively as well as those that wanted to contribute information or discuss operational or funding issues related to office automation or information systems. We also decided that, to the extent possible, information should be collected from all nine target provinces so that we would have a more complete picture of issues across Canada.

Data Collection

The following data gathering approach was adopted for this review:

1. FNCCSC identified agencies that used a uniform computerized information system and invited them to participate in the review.[5]
2. The researcher called the designated contact, explained the purpose of the interview, named the types of information to be collected,[6] and set up a time for the interview. Email confirmations were sent out.
3. The researcher conducted phone interviews with the designated persons(s)[7] at the pre-arranged time.
4. At the end of the interview, the researcher asked, where warranted, for the name of the system developer and/or the name of a provincial contact for information on the provincial system.
5. Where more information needed to be collected from the system developer or the provincial contact, steps 2 and 3 were followed. On a number of occasions, additional provincial officials had to be identified and interviewed because the original contact did not have full answers to our questions, and steps 2 and 3 were repeated. HRDC also gave us with the names of provincial officials who were members of the National Child Protection Outcomes Working Group, and encouraged us to contact them where needed.

Information was collected from agencies, government officials, and/or system developers in all eight target provinces. Specifically, eleven agency officials representing eight FNCFSAs were interviewed. Detailed technical information was gathered from three external consultants or technology suppliers related to systems installed in three of the agencies. We also interviewed ten provincial officials having direct knowledge of or responsibility for implementing provincial systems. The following table provides the breakdown.

Number of People Interviewed

Province	Agency Officials (FNCFSAs)	Provincial Government Officials	Developers /System Suppliers
British Columbia	2+ (2 agencies)	0	0
Alberta	0	3	0
Saskatchewan	2 (2 agencies)	1	2
Manitoba ++	3 (1 agency)	3	0
Quebec	1 (1 agency)	0	0
New Brunswick +++	2 (1 agency)	1	1++++
Nova Scotia	1 (1 agency)	1	0
Newfoundland and Labrador	0	1	0
Total	11 (8 agencies)	10	3

\+ 1 was an in-house developer

++ 1 manager in a First Nations regional authority became unavailable at the prearranged interview time, and did not return phone message.

+++ 1 technical manager became unavailable at the prearranged interview time, and did not return phone message.

++++ Same person who supplied the same system to the Quebec agency interviewed.

The researcher received very good cooperation from all respondents, and successfully completed all interviews, despite their lengths. The interviews, guided by a set of standard questions, were conversational in style and exhaustive in nature, involving frequent probing for details. All respondents provided frank, factual and useful information. The average time to complete a phone interview was 1 hour and 30 minutes. Two agencies also shared materials or reports with the researcher as supplementary information. A number of respondents were re-contacted for additional information.

Types Of Information Collected

Depending on the role of the respondent, the kinds of questions varied.

The main emphasis in interviewing government officials was on understanding the current features of the provincial information system, including specific technical changes made to the system since the nationwide review conducted in 2001-2002, availability of child protection outcomes data in the current system, and arrangement between the government and FNCFSAs regarding use of the provincial system.

Interviews with FNCFSA officials and their technology suppliers focused on the following areas:

- Types of technology deployed
- Technical features of agency information system or database
- Data sharing capacity
- Interface with provincial system
- Ability to generate reports for INAC and government departments
- Availability of child protection outcomes data
- Arrangement with province regarding using the provincial system
- Technical support
- Technology costs
- Technology funding
- Future plans

The timeframe and budget of this project did not allow site visits or hands-on verification of the information provided. For example, we did not have an opportunity to extract data from agency databases for testing.[8] Probing for technical details during the interviews was the only way to allow us to assess the technical capability of an information system.

Findings

This review of office automation and information systems used in FNCFSAs employs a case study approach, arguably the most appropriate one given the purpose of the review and the complex issues involved. The nationwide scope, inclusion of all major types of organizations, collection of detailed information from the most knowledgeable respondents,[9] and vigorous efforts to gather frank and accurate information from both agency and government sources allow us to form a good and balanced understanding of specific situations, needs, issues, and the larger context in which agencies operate. The findings of the review, issues identified, suggested solutions, and costs are presented in the following sections.

Using Provincial Child Protection Information Systems

In the majority of provinces, most, but not all, FNCFAs have some sort of computer technology, and many of them are connected to the respective provincial information systems in one way or another.[10] As provincially mandated child welfare organizations, all FNCFSAs are required to contribute to the provincial system information or data pertaining to all off-reserve cases (on-reserve cases as well in some provinces) they serve. Agencies do so by means of an online system, paper reports, or document/spreadsheet files. Other than this requirement, the government does not stipulate the kinds of systems agencies must use to manage their day-to-day operation, including service delivery.

Although very few FNCFSAs outside Ontario[11] have their own child protection information system, it appears that the majority do use computers for basic office functions. Those agencies without their own information system use either the provincial system or a paper file system to manage service delivery. It also seems that all provinces prefer FNCFSAs to use some aspects of the government system, and some have rolled out a deliberate plan to sign up agencies. Provincial recruitment strategies typically involve offer of free ISP service. One province also gives out free computer hardware and installation service if the agency does not have and cannot afford suitable computer equipment. Building a province-wide broadband infrastructure of fiber optic lines to allow remote agencies to have high speed connection to the provincial system is a

project underway in one province. At least two are considering using satellite ISP service to speed up data transfer for remote locations where dialup connection is currently the only option. At the same time, it is interesting to note that, according to one agency, they have to pay the government $4,000 a month for using the provincial system. All other provinces offer free access to the government information system.

Provinces seem to vary not only in terms of level of enthusiasm and strategies with respect to signing up FNCFSAs for the provincial information system; how an agency accesses the government system is also different. Depending on the provincial plan, there are generally two different ways. One setup involves installing thin client remote access and security software on the computer of each worker mandated by the province to provide child protection service. [12] (Note: non-mandated workers are not allowed to use the provincial system.) The other arrangement is for the province to install in the agency a "provincial" computer and a printer dedicated to the government information system. Only the provincial worker on location or a government-authorized agency employee is allowed to operate the equipment. It should also be noted that access by agency staff to the provincial system is restricted to certain service delivery and management modules only. Financial modules are, without exception, not available to agency users. Security concern is the reason cited for restricted access.[13]

Private Information Systems Installed

Outside Ontario, there are at least four different private systems in use by a handful of FNCFSAs in Canada. The following paragraphs summarize their features and capacity, as per information provided by their respective respondents.[14]

What appears to be the most advanced system of the four is a Sybase client/server application produced with PowerBuilder. It was first developed in 1995. The main modules include Basic Case Management, Payment, Support, Prevention, and Outside Service. A noteworthy feature of this particular system is a case audit module developed to meet government audit standards. According to the respondent, this system is properly designed, incorporating adequate data integrity enforcement features, and has the ability to store various types of historical data and to output electronic data files. However, only a limited set of data needed for the national child protection outcomes measurement project is currently available. Enhancement plan includes incorporating a case tracking capability among agencies. Six or seven agencies in the province are also using this system under a lease agreement.

The second private system is a SQL Server client/server application being written in Visual Basic. Mainly for reasons of lack of sustainable funding, this system is still under development after 10 years.[15] According to agency respondents, this system, when completed, will allow them to easily manipulate data to meet various statistical reporting requirements, to exchange data with other agencies, to interface with government systems, to contribute to internal and external planning and evaluation processes, to efficiently manage service delivery and human resources, and to achieve a high level of operational and financial accountability. This system will also have program performance indicators for inputs, outputs and outcomes, a recommendation or requirement under INAC's new Results-Based Management and Accountability Framework. The types of information available will include: core information on child-in-care and protection cases, information on foster parents, homemakers and parent aides workers/supervisors, financial information to facilitate payments to foster parents and service providers, and police and Abuse Registry Information. A cursory review of the work produced to-date suggests that this project has the potential to evolve into a comprehensive and capable system, if the database structure is properly designed and the application competently written to take care of complex data linking, among other technical challenges. The agency producing the system has been using Excel to manage service delivery. Because of incongruence in structure between their Excel spreadsheets and the SQL Server database under development, most of the existing data cannot be salvaged. However,

being a system under development, opportunities to include historical outcomes data should be reasonably good.

The third private system, installed in two agencies in two different provinces, is supplied by a firm in Toronto, Ontario. It is a 4th Dimension client/server database application probably written in Visual Basic. The modules available are Agency Resources, Clients (demographics, education, employment, etc.), Cases (intake, placements, and services provided), and Payment. According to the company's technical salesperson, the database design, including data integrity enforcement, is adequate and the database has all sorts of historical data that can be unloaded for external use. We were also told that all the data needed to measure child protection outcomes are available. Each module can be customized for or by the client. Features customizable include pick lists, reports, data extraction, and other things. This application seems to rely extensively on templates to achieve customization. Service planning is a main feature: it allows the worker to pick service objectives and associated outcome indicators, identify service providers (workers/agencies), set target dates, review results, etc. Built into this system are the standard assessment tools used in the agency's province. The two agencies that have this system also use AccPac for accounting functions, but software interface between this system and AccPac is not available, according to one of the respondents.

The fourth private information system, reported by one FNCFSA included in this review, is actually an off-the-shelf contact management software package customized for that agency. This package is a Pervasive SQL database application, but it is unclear which language is used to develop it. Although this system is not a specially developed database application in the traditional sense, its usefulness might still be appreciated by the user because the supplier is able to customize, within limits of the database structure, to suit existing, new or changed requirements. According to the supplier of this system, producing reports for INAC is not a problem. Most of the data needed for child protection outcomes measurement is not in the system, likely due to the particular original purpose and database structure of this software package.

Computer Equipment Deployed

FNCFSAs that have computers use various versions of Microsoft operating systems, enabling system software, and office suites. Microsoft Publisher, Project and Visio are also used by at least one agency. PCAnywhere and NetSupport Manager are the most popular remote support tools, which, along with Citrix, are also used for remote access to database servers. In addition, many of the agencies, whether they use a private information system or the provincial system, also use an off-the-shelf accounting software package, and AccPac is the dominant choice in this category. However, in all situations, because of absence of software to connect the accounting package to either the provincial or the private information system, staff needs to enter data twice. A common practice is to enter data into one system first, print out a hard copy of the information, and manually key the copy data into the second system.

In terms of computer hardware in use, there is an even greater variety, perhaps a reflection of different affordability levels and history. Computers range from Pentium I or II workstations with 64MB RAM running Windows 95 to dual-Xeon class server computers powered by Microsoft Server 2003. While all the agencies interviewed have a Windows local area network in place (some also implement messaging function), we are certain that workstations in many of the small agencies not interviewed are mostly older standalone computers.[16] Depending on the operating system of the provincial information system, the workstations of mandated workers permitted to access the government system may or may not have 3270 emulation software installed.

Remote access is mainly via broadband or dialup connection. However, satellite is being considered by a large agency as a substitute for the much slower dialup option. Thin client remote access software and firewall software are often used. VPNs are also deployed to achieve secure communications for remote users who

directly connect to agency networks or servers. Generally, both governments and agencies have a similar setup for remote access, although it is most likely that government systems deploy more functionality servers, enforce stronger firewalls, and implement tightly coded secure services portals.

Technical support in the largest agencies is provided onsite typically by agency staff along with offsite consultants. Small agencies rely on offsite support personnel. Government technical support is available only to agencies that have a direct connection to the provincial system.

Mainly because of lack of money, many agencies are still using computer equipment that should have been retired years ago. For example, two provincial sources mentioned that they had come across agencies still using very old and slow computers running Windows 95. We assume they were referring to Pentium I, 486 or even 386 computers. Using obsolete hardware and operating systems usually gives rise to the following problems:

- Efficiency is compromised due to inability to deploy newer software that is not only easier to use but also has better features. In addition, older equipment takes more time to process commands, and cannot use new hardware devices due to lack of software drivers.
- Networking older computers running obsolete versions of Windows or DOS is always technically difficult. The operation is slow, and unstable or failed performance is a common complaint.
- It is expensive to maintain old equipment because it has a higher than normal rate of hardware failure. Certain replacement parts are sometimes hard to find and costly.
- Downtime due to hardware problems further reduces worker efficiency. Need to redo things because of lost or damaged work also directly wastes staff time and causes frustration.
- Information systems cannot be deployed using obsolete or inadequate hardware and software. (Details are presented in later sections of this report.)

In the case of one agency, old technology has already created problem for them to work or liaise with the government. They have had difficulty exchanging electronic files with the province since the time the government upgraded their operating system and office software. According to the respondents, they need to upgrade their office automation software from Microsoft Office 97 to Office 2003 and the operating system to Windows XP Professional in order to comply with the current software standards of the province. Software upgrades often entail hardware upgrades too which, in this case, mainly involve, fortunately, installing more main memory in the computers.

Provincial Child Protection Information Systems[17]

Since the time the characteristics and capacity[18] of provincial/territorial child protection information systems were assessed in 2001-2002, improvements have been made to a number of these systems. Although reviewing government systems is not a focus for this review, it is useful to briefly mention the main characteristics of these systems, especially with respect to technology deployment and availability of data for the measurement of child protection outcomes. Both aspects have implications for technology planning on the part of FNCFSAs.

The 2001-2002 review showed that enterprise-scale client/server computing had been very widely implemented to add flexibility and power to mainframe computing. Using industrial-strength RDBMSs (Relational Database Management Systems) to develop child protection information systems across the nation was another distinct development. A number of the provinces, including a number of mainframe-centric operations, were hoping that enterprise-level applications developed with RDBMSs and deployed on a client/server computing architecture would allow them to have a unified information system for sharing data across departmental programs and services. We also noted that, although client/server computing has been very popular since early 1990s and true RDBMSs were first introduced in early 1980s, mainframe-

centric government organizations had been slow in adopting such new technology.

Four years later, both trends continue to dominate. Availability of 64-bit computing will expectedly solidify these trends and give rise to more and better design options. In addition, there is a significant emerging development: web applications. Both Nova Scotia and Manitoba have produced viable applications deployed on the Internet. The Manitoba system may also the first Linus-based child protection system in Canada. It is very likely that other provinces are also pursuing the web option, which particularly suits users with high bandwidth communication lines and equipment. Security should not be an issue with the deployment of VPN or tightly coded secure internet services portals. Despite what appears to be a rapid adoption of cutting edge technology by the majority of provinces, a small number of them are still mainframe-centric, working in a predominately UNIX environment where terminals or workstations running 3270 emulation are in widespread use.

Other than using better technology to improve performance, facilitate users anywhere to access the information system, and reduce costs, a number of provinces have also been working to enhance their data ability to support national efforts to measure child protection outcomes. Among the eight provinces included in this review, British Columbia, Alberta, Manitoba, Newfoundland and Labrador, and New Brunswick are taking a lead role in this area. In at least three provinces, data not previously available is being added to their databases. The following table summarizes progress made to-date by the eight provinces included in this review, regarding availability of data needed for outcomes measurement in their information systems.

Data Needed for Outcomes Measurement	Alberta	British Columbia +	Manitoba	New Brunswick +	Newfoundland and Labrador	Nova Scotia	Quebec /CJLPJ +	Saskatchewan +
Child's DOB	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Child's sex	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

+ Current information not collected. Most likely no change since 2002.

Information System Costs to Agencies

Office automation and information system technology can be costly to acquire, maintain, upgrade and support. This review discovered that many of the computer-using agencies have not upgraded their systems for a long time and are finding themselves having problem using newer releases of software, operating their private information systems, or even exchanging electronic files with the government. A few managed to find money in their budgets to upgrade or replace some of their computer equipment to avoid failed operation.

This review uncovered a wide range of cost figures related to technology deployment, and some of these figures, representing either an agency's current year estimates, or expenditures actually incurred in the agency's current or last fiscal year, are presented below.

The primary reason for the big variance has a lot to do with the specific needs and size of the respective agencies. A larger agency has more computers to upgrade and/or replace, and the cost is naturally much higher than that of a small agency. How much something costs also greatly depends on what is acquired or gets replaced. For example, the cost to replace a functionality

Agency	Computer Hardware (LAN included)	Computer Software	Information System	Others (Tech support, training)	Total[20]	Notes
A	$251,220	$69,375	$85,000 (System development work)		$405,595	Of this total, cost to upgrade hardware and software to allow for compliance with provincial requirements = $220,040
B	$25,000	$5,000	$48,000 (Fee paid to province for use of system)		$78,000	User of government system exclusively
C	$26,000	$3,200	$5,000 (RDBMS license fee)	$2,350	$36,550	
D	$52,500	$1,200			$53,700	User of government system exclusively
E			$41,500		$41,500	Recently acquired own information system
F	$45,000		$4,430		$49,430	¨ Need $45,000 annually to replace 25 of the 125 computers each year, but this allocation has not happened. (Expected life span of a computer is 5 years) ¨ Budget for software upgrades also does not exist
G		Will soon have to install Windows XP Professional on all 17 computers			?	No budget information was received
H	$49,000	$1,000			$50,000	¨ User of government system exclusively ¨ Agency tries to allocate $30,000 each year for office automation

server is many times more than that to replace a desktop computer. Another example: buying Microsoft Exchange Server CALs (Client Access Licenses) alone for 125 workers costs $14,000[21], whereas buying a copy of PCAnywhere only costs $200. Similarly, an agency having to replace all its 30 obsolete computers for the first time in 12 years has to pay significantly more than another same size agency just needing to add 256 MB memory in each of its 30 computers acquired, say, only three years ago. Furthermore, developing information systems is always expensive, and the costs to develop and maintain the application and to acquire the necessary hardware and system software to support the information system must be included in technology deployment planning and budgets.

Although the wide range of these cost figures is the direct result of situational and needs factors unique to the individual agencies, these figures together do give us a glimpse of certain key aspects of the reality, and they are as follows.

- Office automation and information systems can be expensive to acquire, maintain, and support.
- Computers, especially servers, in an organization need to be upgraded (where possible) or replaced every four to seven years.
- Whether an agency uses the government system or its own system, it still has to find money to buy all the hardware and software, to maintain and upgrade them, and to pay for support and training.
- A viable technological infrastructure must exist in the agency first for an information system to operate. Therefore, in estimating costs of an information system, all aspects of technology deployment in the agency, not just those specific to the information system.
- A uniform method to plan office automation and information system work is needed.

A subsequent section of this report suggests one common and equitable framework for estimating costs related to deploying office automation and information systems.

Issues Regarding Agency Use of Provincial Information Systems

As mandated provincial child protection organizations, all FNCFSAs are required to supply data concerning cases they serve to their respective provincial governments. As a result, all agencies do interface, in one way or another, with the provincial system, but it seems that a large percentage of them are reluctant to use the government system unless they feel they do not have a choice. In addition, despite invitations extended by a number of provinces to FNCFSAs to use the government system, many agencies are still using a paper file system. There are a number of reasons for this phenomenon.

Technology Funding

Although provincial governments, with the exception of one, do not require agencies to pay an access fee, using the provincial system is not really for free. Agencies must have a viable technological setup (adequate computers, current operating systems, networks, and, in many situations, useful communication links) before they can connect to the government system. Most agencies do not have the necessary technology simply because they cannot afford it. Provinces do want agencies to contribute data to and use the government system, but do not seem to want to give out or pay for the needed equipment. Since FNCFSAs are federally funded agencies performing provincially mandated reimbursable child protection services, provinces see that INAC, not them, have that direct responsibility although they all know INAC does not provide technology funding. The only kind of offer provinces are willing to consider is paying for external communication links, i.e., Internet Service Provider service charges. This combined government position has also hampered the efforts of provincial officials in charge of rolling out a provincial system.

We also know that only a handful of FNCFSAs across Canada use a private information system -- either their own creation or one leased from an external source. According to the respondents, the main reason for the paucity of FNCFSA-specific information systems is lack of funding, definitely not lack of needs. All agencies realize the importance to have a viable information system

to allow them to efficiently manage day-to-day service delivery and generate reports or information for INAC and other government departments, among other things. They also very much like to have a system that allows agencies to exchange data electronically with government departments, a direction advocated by the Attorney General of Canada. Achieving these objectives requires computer technology, but both levels of government are silent on who would pay for what.

The story of one large agency is worth noting because this is a good example of how the current funding system can directly prevent agencies from getting things done right, a real dilemma especially for accountability- and efficiency-conscious organizations. Since there was and still is no information system that can meet the needs of First Nation agencies having to satisfy the dual reporting requirements of both federal and provincial governments, this agency began to develop a database application in 1994 that would eliminate double data entries, thus resulting in saving tremendous amount of staff time and producing more accurate reports. Their goal was to have a cost-effective, user-friendly and unified data system that could interface with the provincial system and INAC for better communication and timely sharing of information, based on consistent and standardized data collection and reporting. To-date, 10 years later, work is still incomplete due to absence of INAC funding and government support. Struggling to find money outside the agency to complete the project has apparently consumed a great deal of staff time and caused much frustration over the years. Recent refusal by the province to pay for hardware and software upgrades to allow them to continue exchanging files with the provincial government has added another layer of frustration.

Absence of INAC and provincial funding for technology is a main concern among agencies across the nation. However, it appears that not all provinces are equally firm on their position with regard to paying for certain computer equipment. For example, if a province is very anxious to get agencies use a newly rolled out provincial system, it might consider exception.

However, the problem remains that there is no government policy or even a consistent and clear understanding regarding who pays for what.

Perceptions of Usefulness of Provincial Systems

Most respondents believe that the reason why the province is anxious in getting them to use the government system is because the province needs their data. A number of ways are used by agencies to supply data: facsimile reports, spreadsheet files, document files, or direct remote data entry (for agencies that have suitable equipment). Stationing a provincial worker in the agency to collect data concerning specific types of cases using dedicated provincial computer equipment is not an unusual arrangement. Some provinces collect off-reserve cases only, but others want both off- and on-reserve cases.

Most agencies on the government system are dissatisfied. A general perception is that the province wants agencies to contribute data, but in return is not interested in giving them the tools they need. Their complaints are quite consistent and some respondents said they were certain that other agencies would have shared the same views. The common reasons cited for their unhappiness are as follows:

- Use of the provincial system is presented as a condition for service agreement. Agencies are not given a choice.
- Agencies are not permitted to access the financial module of the government system, for stated security reasons. As a result, they use a separate accounting package to manage financial data. Lack of software connectivity between the accounting package and the government system requires double data entry. In addition, computing child-based or service-based cost statistics is not possible or is very difficult.
- Provincial information systems are designed for government users exclusively. There is no special version for FNCFSAs with interface features and the kinds of information they need. Another consistent main complaint is that the reports available do not meet INAC requirements, and the province has no plan

to customize any features of the government system for FNCFSAs. Agencies must compile INAC in a labour intensive way.

- A few provinces, as mentioned above, still use a UNIX system. For people familiar with the Windows environment, using a text-based information system developed long time ago is counterproductive. Finding simple information often requires extensive and tedious navigation, a difficult, time-consuming and frustrating process. The kinds of reports available are difficult to read and some span rows or screen pages.

INAC Reporting

The Auditor General of Canada report[22] identified the following financial and non-financial reports (reformatted for inclusion here) that First Nations child and family services authorities are required to submit.

Financial Reports

Indian Child and Family Services Child Specific Invoice Summary (10th day of the month for CFA)	This report is submitted to INAC by the agency providing the service to request reimbursement. It includes a summary for the month containing the following: - Child information (such as name, member number, and date of birth). - Date of admission into care, type of care, and most recent placement date. - Start and end pay date, basic maintenance total, skill fee or fee for service, special needs description, and total, and total amount invoiced.

Non-Financial Reports

Child Care Notification Form (Monthly on the 10th day for services funded by the Comprehensive Funding Arrangement)	This form is completed when a child is removed from its home and placed under child protection in alternative care facilities. It includes the following: - Child information (name, gender, birth date, address, health insurance number). - Where child was apprehended from, reason that a Notification is being completed. - Type of care being provided, type of action taken under the Child and Family Services (CFS) Act, date action was taken. - Information on both parents indicating who is the care-giving parent with Indian Status and who is the custodial parent. - Information on person providing care if the birth parent is no longer doing so, and entity that is financially responsible for the child (for example, INAC, Provincial Social Services, or provincial Justice Department).
Special Needs Greater Than $2,000 Report (Monthly on the 10th day for CFA fund)	Special Needs Greater Than $2,000 requests need approval annually by INAC and state the special need requirement for each child including estimated yearly cost over $2,000.
CFS Operational Report (Twice yearly on Oct 15 and April 15)	This report for INAC operations funding is to reflect services to residents who are normally resident on the agencies' member reserves and includes the following: - Information on Prevention Services (list of specific services provided; number of families and children served by each; number of local CFS committees active; number of elder committees; number of Public Information and Education workshops) - Information on Protection Services (list of specific services provided; numbers of families served with/without placement; number of trained/approved foster care homes and parent aides contracts; number of children placed in off-reserve resources; number of children having status under the CFS Act; and number of adoption homes)

Although the number of reports is not large, compiling the kinds of information needed for these reports can be a difficult recurrent task for agencies without an information system, and the degree of hardship is proportionate to caseload size or agency size. In addition, it is easy to introduce errors into manual reports. Since no provincial system includes INAC reports, it is not difficult to understand why all agencies want to have their own automated information system to allow them to not only handle reporting with ease, but also manage day-to-day service delivery in a way directly relevant to their particular needs, and assess performance, among many other benefits.

Performance Measurements

As mentioned before, a national child protection outcomes measurement project is underway under the auspices of HRDC. Given the significance of this concerted effort, we have included a summary of the Outcome Indicator Matrix in the appendix. For the purpose of this review, it is useful to know what data is needed to measure what outcomes as per the conceptual framework of the matrix. The following table identifies this data requirement.

Historical or time-series data is needed. All required data is deemed to be basic and should exist in provincial child protection information systems.[23]

The section on provincial child protection information systems above includes information on current availability of outcomes data in the eight provinces of interest to this review. It appears that, currently, measuring Recurrence of Maltreatment, Placement Rates, Moves in Care, Time to Achieving Permanent Placement appear to be possible. Provinces leading the national project are working hard to modify their databases to include data for as many indicators as possible. One provincial contact informed that he was confident that his province would have, within the near future, data for 8 of the 10 outcome measures. However, there is no known timeline set by the provinces for achieving this data objective.

The Ontario Incidence Study[24] and the Canadian Incidence Study[25] reveal that disproportionately large numbers of First Nations children are served in the home or in care across Canada.

Domain	Indicator	Variable
Safety	Recurrence of maltreatment (rate & incidence)	· Reopening date · Reopening closing date · Reason case reopened · Type of maltreatment · Type of substantiation
	Serious injuries/deaths (rate & incidence)	· Date of injury · Injury severity · Injury type · Injury intentionality
Well-being	Grade level/Graduation	· Date of grade level/graduation report · Grade level/graduation
	Child behaviour	· Date of child behaviour rating · Child behaviour rating
Permanence	Placement rate	· Placement date · Placement type · Discharge date · Discharge type
	Moves in care [Placement changes] (rate & incidence)	· Placement date · Placement type · Reason for move/placement
	Time to achieving permanent placement	· Placement date · Placement type · Reason for move/placement
Family & Community Support	Family moves (rate & incidence)	· Date of address · Address or Postal Code
	Parenting capacity	· Date of parenting capacity assessment · Parenting capacity assessment
	Ethno-cultural placement matching	· Date of placement · Ethno-cultural matching · Placement inclusiveness

For First Nations child protection authorities, ability to measure the complete spectrum of outcomes of child protection services and to report on outcomes periodically should be of particular importance. Unfortunately, the current provincial information systems, main sources of First Nations child protection case data in Canada, are short of this capability, and it is unclear how long it will take before we see real improvement.

According to information shared by an agency, INAC recently introduced a "Results-Based Management and Accountability Framework". One requirement under this initiative concerns program performance measurement. Indicators for resource inputs (what was spent), activities (what was done), outputs (what was produced), and outcomes (what benefits or impacts resulted) will need to be developed for each program as per its goals and objectives. A very important prerequisite for successful measurement is availability of data needed to support the various indicators. Because the measures are specific to First Nations programs, the kinds of data required mostly likely do not exist in provincial information systems. This means that First Nations agencies will have to have their own data systems to allow them to meet such emerging accountability requirements.

Implementing Information Systems in FNCFSAs

The Attorney General of Canada, focusing on the issue of federal reporting requirements, decried the situation two years ago, and concluded that First Nations agencies must have capable computerized information systems to deal with cumbersome and excessive reporting requirements. Unfortunately, due to lack of technology funding, the majority of FNCFSAs still does not have any or are not given a suitable information system. Not only do they have to continue to endure hardship in connection with reporting, they also cannot, among other things, efficiently manage service delivery, meet their accountability requirements, work collaboratively with each other and with government departments by means of data exchange, or participate in important national or regional performance measurement endeavours. In order not to remain in a helpless state, a couple of large agencies decided to develop their own systems a few years ago. We have also seen medium size agencies beginning to use a leased system, although they can barely afford it. It appears that most agencies across Canada are anxious to have a suitable information system.

Selecting an Information System

Basic Considerations

The purpose of any information system, regardless of type of organization and nature of business, is to support efficient and effective operation[26] of the organization as per its mandate, vision, mission, goals, and objectives. For an information system to be and remain useful, it must be properly designed and managed. Meeting the following design principles is very important:

- The kind of RDBMS deployed must be an industrial-strength system[27] with a robust engine designed to handle very large data volume. Multi-CPU support is an advantage.
- The database and applications must be designed to exactly mimic the operational model or processes of the organization, and comply with provincial legislation, policies and standards.
- The database structure must have the ability to allow quick modification to accommodate sudden changes in the organization's operational processes, or new requirements externally introduced[28].
- The data in the database must be valid and complete to support the agency's needs, via tight data integrity enforcement at the structure level, form level, and code level.
- The applications must be designed with the user in mind, including features like logical and user-friendly graphical interface, familiar terminology, flexible searching for information using user-defined criteria, easy navigation, and attractive graphics.
- The data in the database must be available for SQL manipulation behind the scenes to facilitate managers to perform quick queries, computations or other reports, above and beyond what the standard menus provide,

and to allow live connection to external data sources.

- The database system must support local as well as remote access.

Specific to FNCFSAs, the following additional features are important, and each has implications for the database and application design:

- Financial data related to the child and/or the child's family must be captured and stored in the same database. This is the best way to facilitate accurate and convenient computations of costs, especially unit costs using child, family, or service event as the unit. Cost comparisons across categories, e.g., type of abuse, type of placement resource, etc., are possible only with cost data totally integrated and linked to the child or the family.
- All standard detail and summary reports required by INAC must be efficiently designed, exploiting the power of SQL, and temporary views and tables, for example. Using any of the report should be a one-button operation. The same design approach should be applied to all other reports.
- The application must include a "one-button" feature to automatically upload or supply selected data to external organizations, e.g., daily case data to the province, daily case data to a regional or national tracking system, monthly summary data or statistics to the national outcomes data pool, monthly report data to INAC, etc. Design specifications must be worked out with the parties or dataset recipients involved. This is the level of data exchange advocated by the Auditor General of Canada.
- The data in the database must be selectively retrievable for sharing with external groups on an as-required basis, like INAC, First Nations Statistical Institute, and university research institutes.
- The database must incorporate all the data and measurement scales needed to support the national outcomes measurement project.
- All data, especially events data, in the database must be historical and date-specific to permit meaningful statistical analysis, case audits, child protection outcome measurements, and other types of performance measurements.

Costs of Information Systems

Ten years ago, when very few relevant child protection information systems were commercially available, agencies in need of one usually ended up developing their own. They hired external consultants to do that if they did not have qualified developers on staff. For example, in late 1960s, the Children's Aid Society of Metropolitan Toronto used internal staff to produce the very first child protection information system in Canada. The Catholic Children's Aid Society of Metropolitan Toronto did the same a few years later, followed by the Ottawa Children's Aid Society and one or two others. These were and still are among the largest child protection agencies in Canada and could afford developing their own information systems. However, since early 1980s, leasing a commercial system has been the trend. Currently, all the remaining 48 children's aid societies and close to 10 First Nations child protection agencies in Ontario use a leased system.

In the field of First Nations child welfare in Canada, a similar trend took place. West Region Child & Family Services, Inc. in Manitoba, one of the largest FNCFSAs in Canada, decided to develop its own system in 1994. Lalum'utul'smun'eem Child & Family Services in British Columbia did the same a year later. However, the current trend is to lease, although the number of agencies which can afford their own system, leased or otherwise, are still far few and in between, as described above.

To lease or to develop is always a difficult decision, and there are no specific rules. However, the following factors should be taken into consideration in making such a decision:

- Which way is less expensive in the next 5 years? (Initial cost, license and software costs, support cost, modification cost, etc. Warning : it is not uncommon to see cost overrun in application development projects.)
- Who (vendor or developer in mind) is more familiar with the child welfare service delivery system, operational and reporting requirements,

legislation, etc.? (Content knowledge impacts relevance, quality, delivery timeframe, cost, time of agency liaison, etc.)

- Who (vendor or developer in mind) is more technically competent? (Knowing the person's track record, clients' satisfaction, similar work completed, etc., is very important. Can this person deliver the expectations listed under "Basic Considerations" above?).
- How long does it take to have the system installed and staff trained? (Leased systems are by definition in a far more favorable position on this count.)
- Who (vendor or developer in mind) can provide better support?
- How long is the person (vendor or developer in mind) going to be in business? (How long has this person been in business?)

Assuming the decision is to lease, deciding which vendor to use is also not easy. Given wide variations between vendors in price, features, product quality, and technical support ability, it is extremely important that the agency sees a live demonstration, asks in-depth questions before, during and after a demonstration, and talks to current users of the system under consideration. The agency must also assess the real technical ability of the vendor, among other things. Making promises is totally different from getting things done or successfully resolving problems. In addition to the expectations list under "Basic Considerations" above, the questions included in the table below should be useful to agencies choosing a commercial information system.

Technological Infrastructure Required to support an Information System and Costs

Information systems cannot be implemented without a viable technological infrastructure in place. It is equally important to realize that computer technology in the office deemed adequate for office automation is not necessarily capable to support the operation of an information system. The technology required for implementing information systems is far more demanding. However, a technological infrastructure good enough for supporting an information system is always able to host office automation, including demanding features like imaging, voice-over-Internet, collaboration, remote computing, etc. The paragraphs below identify the types of technology needed to operate a typical information system in voluntary child protection agencies, and suggest a common framework for estimating the costs of such technology.

Minimum Computer Hardware Needed

What kinds of computer hardware and software agencies need to build an adequate technological infrastructure to support an information system, leased or otherwise, is quite a complex matter. Our observation is that, in the case of FNCFSAs, organization size, whether or not an organization has one or more locations/branches, and adequacy of current computer equipment in use are together key determinants of the kinds of technology an agency needs to allow them to set up an information system. For example, the types of system software and hardware and support structure needed by a small self-contained agency with, say, only 5 workers are quite different from those required for an agency that has a head office and two branches and whose workers, regardless of where they are located, have to access the agency information system in head office. Variations in technological requirements directly affect costs as well.

Other than size and geographical spread of an agency, adequacy of computer technology in use creates another level of complexity. Information systems require fast servers, desktop computers and communication links on a functioning network. In addition, suitable operating system software for the servers and desktop computers must be properly installed and configured. For this reason, agencies currently using 386 or 486 standalone computers or slow servers will need to replace what they have.

Generally speaking, the following types of computer hardware are considered as minimum for operating a typical agency-level child protection system:

- Workstation: Pentium-class computer with 1 GHz processor, 512 MB main memory, 8 GB

Subject	Questions to ask
Cost (Initial)	Leasing a commercial system costs between $30,000 and $45,000 in the outset. This fee generally includes customization to suit agency needs and onsite training time. In addition, there is a monthly or annual charge for phone support, software upgrades, and in some cases, user group membership. However, there is no standard for this type of charge. If the system is the client/server or web version, then number of locations in the organization should not affect the price. It is useful to remember that familiarity with operation and needs of child protection agencies, work quality, technical ability, relevance of the system, and professionalism are far more important considerations than price. A wrong decision in the beginning can cause very serious problems for the agency and will cost a lot to fix the problems. Examples are plenty. Ask the following questions: ¨ What modules are included in the price? What are their specific features? ¨ How many users are included in the license? How much extra does it cost to add users? ¨ What additional modules are available? What are their specific features? What are their prices? ¨ How much does it cost to transfer existing data to the system? ¨ Is onsite training included in the price? ¨ Can you provide references (current First Nations agency users)?
Cost (Annual)	Vendors charge between $2,000 and $15,000 a year for support and software upgrades. Ask the following questions: ¨ How much is the annual or monthly charge? ¨ What is covered by this fee? ¨ Are there additional charges?
Support	Technical support is usually included in the annual or monthly fee. Ask the following questions: ¨ Is there a limit on the number of support calls? ¨ How is remote support (remote connection to the system by vendor to solve problems) managed?
Features modification	Enhancement work is usually billable. Ask the following questions: ¨ What does it cost to add or change features in the application? ¨ How is the cost determined? What is the fee structure? (Ask for examples and details.)
Data extraction or exchange	It may be treated as enhancement work or one-time service. Usually billable. Ask the following questions: ¨ What does it cost to extract data from the database? ¨ What does it cost to add to the application ability to periodic exchange (upload and download) data with external organizations? ¨ How is the cost determined? What is the rate? (Ask for examples and details.)
Others	Ask the following questions: ¨ Can agency staff go into the actual database to use the data directly? Are there restrictions? ¨ Does the vendor have a web version for deployment on the Internet? ¨ How long has the information system been on the market? What is the current install base? How many First Nations child protection agencies are using the system? (Ask for references.) ¨ Does the vendor have a users group? What is the purpose of the users group? How does it work together with the vendor?

hard drive, 100 mbps network adapter, CD ROM drive, and 1024x768 video resolution operating under Windows XP Professional.

- Application/Database Server: Single Xeon server computer with 2.8 GHz processor, 4 GB main memory, two 40 GB SCSI hard drives (RAID-1), 100 mbps network adapter, CD ROM drive, and 40 GB tape drive.
- Network Server: Pentium 4 class server computer with 2.8 GHz processor, 1 GB main memory, 20 GB SCSI hard drives, 100 mbps network adapter, and CD ROM drive.
- Terminal Services Server: Pentium 4 class server computer with 2.8 GHz processor, 2 GB main memory, 20 GB SCSI hard drives, 100 mbps network adapter, and CD ROM drive.
- Local Area Network: Category-5 cables, and 100 mbps switch.

If an agency's computer equipment falls short of these minimum features, then, for the purpose of hosting a typical agency-level information system, their equipment may be considered as inadequate and needs to be upgraded or replaced.

Recommended Hardware, Software and Related Requirements, and Costs

This section contains detailed information on recommended hardware, software and related requirements and cost estimates for agencies categorized by size and geographical spread. The technical information is produced to the best of our knowledge based on what is available and feasible to do today regarding implementing a technological infrastructure in voluntary child protections agencies.[30] All cost figures are close estimates, reflecting current market pricing, which can vary somewhat between regions. In addition, we expect to see the prices of certain types of computer hardware products come down in the near future as their quality, reliability and features increase at the same time: something to keep in mind when planning to refresh technology a few years later.[31] Given the high degree of complexity of the subject, it is important to treat our suggestions as educated guidelines, which may require adjustment when an agency applies them. Situational, needs and other factors hitherto unknown or that may surface later make it extremely difficult to have just one set of recommendations for all agencies across Canada. In addition, technological advances necessitate periodic adjustment to this set of information to ensure currency and applicability.

The information involved is complex and detailed. The full package of this information and associated costs can be found in the appendix. The table on the next page presents information for three main categories of agencies. To avoid tedious repetition, only references to the applicable details are included in the table. The reader can easily locate the referenced details (equipment, costs, and related information) in the appendix. The reader will also be interested in knowing that charitable organizations, i.e., holders of a Charitable Organization Number issued by the federal government, are eligible for drastic discounts on all Microsoft[32] software products. Discounted prices under this arrangement are also included to allow us to form a more complete picture of costs and to do more accurate cost projections.

As we can see, the final cost strictly depends on the types and amount of hardware, software and service required, which in turn are determined by number of locations, preferred features and number of computers in the entire organization. If an agency already has some of the recommended items, then they will not need to include them in the calculation. However, if some or all existing equipment is of marginal performance, then the agency will need to decide to replace or to keep them. In making decisions of this nature, it is always important to seek input from technical experts who are in a position to make objective informed assessments. Using these guidelines, any agency should be able to estimate in a standard way the cost to build a viable technological infrastructure not only for operating an information system, but also for hosting office automation. Finally, it must be realized that technology budgets must be based on actual hardware and software required, not caseload size. For this reason, INAC's traditional formula based on number of on-reserve children cannot be used to fund technology.

Hardware and Software Required by Agencies to Operate a Typical Agency-level Information System

Agency Type		Recommended Hardware, Software, and Related items[33]	Notes
Type A	¨ One location only ¨ Less than 75 computers ¨	Option 1 - Software: A1; (A2); (A3); (A5); (A7); A8; A9; A10 Computers: C1; (C2); C4; C5 Others: B; D1-D3; E1-E4; F1-F3; G1-G2.	¨ Bracketed items are optional for small agencies (less than 10 computers) ¨ Software and hardware installation and configuration expenses do not apply to agencies having required expertise on staff. ¨ Only one A10 is needed
		Option 2 - Software: A1; A4; (A5); (A7); A8; A9; A10 Computers: C1; (C2); C4; C5 Others: B; D1-D3; E1-E4; F1-F3; G1-G2.	¨ Small Business Server 2003 can support up to 75 devices or users, as per the number of CALs purchased. ¨ Bracketed items are optional ¨ Software and hardware installation and configuration expenses do not apply to agencies having required expertise on staff. ¨ Only one A10 is needed
Type B	¨ One location only ¨ 75 or more computers	Software: A1; A2; A3; (A5); (A7); A8; A9; A10 Computers: C1; C2; C4; C5 Others: B; D1-D3; E1-E4; F1-F3; G1-G2.	¨ Bracketed items are optional ¨ Software and hardware installation and configuration expenses do not apply to agencies having required expertise on staff. ¨ Only one A10 is needed
Type C	Multiple locations (head office plus one or more branches)	Software: A1; A2; A3; (A5); (A6); (A7); A8; A9; A10 Computers: C1; C2; C3; C4; C5 Others: B; D1-D3; E1-E4; F1-F3; G1-G2.	¨ Bracketed items are optional ¨ Software and hardware installation and configuration expenses do not apply to agencies having required expertise on staff. ¨ Item A10 is needed for head office and each branch ¨ Item B is needed for head office and each branch ¨ Items C1, C2 and C3 are needed for head office only ¨ Item C2 may also be needed in certain large branches

please see pages 169 to 174 for component (A#) explanations

APPENDIX A

The following section is adapted from the original Outcome Indicator Matrix document[34]

Recurrence of Maltreatment

Child protection is the core function and primary focus of the child welfare system with the ultimate goal of preventing future maltreatment. Recurrence of maltreatment includes all confirmed cases of child abuse or neglect known to a child protection system in which a subsequent confirmed incident of maltreatment occurs and becomes known to child protective services. Reported rates of recurrence range from under 10% to over 60%. The best study to date reported 24% of families experienced at least one repeat incident of confirmed maltreatment within 12 months of the first incident, 43% repeated within 5 years.[35] Recurrence is measured over a set interval. For example the 12 month recurrence rate is the proportion of children identified by child welfare services as maltreated who are maltreated again within 12 months.

Serious Injuries and Deaths

Protection from serious harm is a key priority for all child protection services and such cases require priority intervention and tacking. While the majority of investigated maltreatment cases do not involve serious injuries or fatalities, every effort must be made to prevent such tragic outcomes. The Canadian Incidence Study of Reported Child Abuse and Neglect found that 4% of substantiated investigations documented physical harm severe enough to require medical attention[36]. While injuries associated with suspected maltreatment and all serious injuries (intentional and non-intentional) to children in child welfare placements (e.g., foster care, group care, & residential care) are documented in child welfare case notes, most Child Welfare Information Systems (CWISs) do not track injury information.

Grade level/graduation

Maltreatment is a significant risk factor for developmental, cognitive, and academic delays. Enhancing child well-being is a paramount objective of the child welfare system. Improvements in cognitive functioning is a key outcome indicator. This is not the exclusive domain of the child welfare system, but it represents a service priority that should be well documented. Research consistently shows that children receiving child welfare services are behind their peers in all aspects of cognitive development and school performance. A community survey in upper New York State found that maltreated children were 2.5 times more likely to repeat a grade than were a matched group of non-maltreated children[37]. Performance can be measured as age to grade ratio, achievement on standardized tests (e.g. Math & English), placement in special education classes, school attendance, and assessed risk of failure. While test scores may more accurately measure specific skills, age to grade ratio is the most feasible indicator for child welfare services to collect, especially for children receiving home based services. For out of school older youth, graduation rates are a simple and appropriate measure. Outcome monitoring for pre-school children depends on the extent to which child welfare authorities use developmental assessments.

Child Behaviour

Maltreated children are higher risk for behavioural problems at home and in school, delinquency, and criminal activity. Preliminary findings from the Looking After Children in Canada Project were that 39% of maltreated youth reported having difficulties with anger, and 32% reported often getting into trouble for defiance[38]. Similarly, a recent American study using the Teacher report from the Child Behaviour Checklist found that over 40% of children in the child welfare system were rated as having problem behaviours compared to 20% in a matched sample[39]. Standardized measures of child behaviour are not generally used in child welfare settings. However, some jurisdictions have started to use instruments that include some behavioural information, either in risk assessment tools or in assessment records for children in long-term care.

Placement Rate

Placement of children in out-of-home care is a consistently documented indicator for child welfare services. Placement in care is necessary for children who cannot be adequately protected

at home or whose needs cannot be met at home. The Canadian Incidence Study of Reported Child Abuse and Neglect found that 8% investigations lead to a placement in care within the first two-months of the investigations[40]. An Illinois study of over 10,000 child welfare investigations found that placement rates increase as a function of the time a case is kept open. At one month after referral 7% of children had been placed in care compared to 21% within one year of the initial referral[41]. Interpretation of placement statistics is complex. An increase in placement rates is not necessarily a negative outcome; it could mean that child welfare authorities are doing a better job at identifying and protecting children who would have been severely harmed if left at home. This is further complicated by the fact that placement decisions are affected by the availability of placement resources. In some jurisdictions official placement rates may significantly under represent children who are placed in non-traditional child welfare settings, such as customary care or informal community placements. Runaway youth should also be carefully tracked in placement statistics.

Moves in Care

Social stability is essential for children to develop a sense of belonging and identity as they cope with separation from their families. Some placement changes can be beneficial, but multiple unplanned moves can have seriously negative short and long-term consequences for children. Moves in care tracks admissions, re-admissions, and significant placement changes. A four year longitudinal study of 717 children who entered foster care in Saskatchewan found that 71% of children experienced only one out-of-home placement. The average number of moves for children who experienced more than one out-of-home placement was 2.3, and only 10% of these had more than 4[42]. The simplest way to measure moves in care is to count the number of moves experienced by children when they are discharged from care. This method measures moves during a specific spell in care. The moves in care indicator should only track significant placement changes, not respite placements or home visits.

Time to Achieving Permanent Placement

Most children brought into care return home after relatively short periods of time. Rosenbluth (1995) found that children entering care in Saskatchewan spent an average of one year in foster care, although the majority of children returned home in less than six months. Placement drift is a concern for children who remain in care. The challenge in measuring time to achieving permanence is deciding which placements can appropriately be categorized as permanent. The simplest definition of permanent placement is one that is intended to be permanent, such as returning a child home (reunification), placement in an adoptive home, or a permanent foster home placement. Using time to achieving permanence as an outcome measure is complicated by the fact that hasty placements may be more likely to break down. Reunification breakdown rates have been as high as 30%. Courtney (1995) found that foster children reunified within three months were more likely to be taken into care again than children reunified between three and six months.

Family Moves

Frequent moves lead to loss of peer and social support networks for children and parents. For children, frequent moves and multiple school changes may prevent the formation of constructive social support networks. Housing instability is caused by many factors including lack of affordable good quality housing, employment changes, lifestyle, and other family crises. While child welfare services are not responsible for providing housing, many child welfare social workers advocate for better affordable housing for their clients and also work with families to adopt lifestyles that will increase their likelihood of enjoying housing stability. The Canadian

Incidence Study of Reported Child Abuse and Neglect found that more than 23% of investigated families had experienced at least one address in change in the previous six months (Trocmé, MacLaurin , Fallon, et al. 2001). A recent survey conducted a the Children's Aid Society of Toronto found that 21% of respondents noted that housing was a factor in the decision to place children in out of home care (Chau, Fitzpatrick, Hulchanski, Leslie & Schatia, 2001)

Parenting Capacity

Parenting capacity is a major concern in many cases of child maltreatment. Most home based child welfare services target parents' ability to meet the emotional, cognitive, physical, and behavioural needs of their children. Improved parenting is a good outcome for children. Better parenting translates into better long-term child outcomes. Parenting is targeted by many child welfare interventions and tools have been developed to assess parenting and family functioning. However, standardized parenting measures are not commonly used to assess families or track outcomes in child welfare. Most risk assessment tools also include a number of potentially useful parenting measures, although their interpretation as outcome measures has yet to be tested.

Ethno-Cultural Placement Matching

When children and youth must be removed from their homes, efforts should be made to place them within their geographic community with extended family, a family with similar ethno-cultural background, or in foster care that is very inclusive of their family and friends. There is well-founded concern that many minority children (e.g. Aboriginal, Black, Muslim, etc.) are not placed in matched foster homes or homes easily accessible to their family and friends. For example, although 64% of children in care in Saskatchewan in March 1990 were of Aboriginal ancestry, and these children spent on average more time in foster care than did non-Native children, less than 10% of these Native children were in matched foster homes. Placement matching data must be interpreted with caution in individual cases because ethno-cultural matching is only one of the factors to be considered in finding the most appropriate placement for a child. Nonetheless, ethno-cultural matching provides a strong indicator of community engagement in recruiting foster homes and finding the most appropriate out-of-home placements for children in their communities.

Interpretation Issues

Many of the indicators selected for the Child Welfare Outcome Indicator Matrix are proxy measures that will need to be interpreted with caution. A narrow focus on any one indicator could have unintended effects on delivery of services. Reducing placements, for example, without ensuring safety and supporting child well-being, could simply result is a loss of services leaving more children at risk of further maltreatment. Proxy indicators that reflect system events can nevertheless provide a meaningful measurement framework if the selection of indicators covers a broad set of domains, as proposed in the Child Welfare Outcome Indicator Matrix.

APPENDIX B

Recommended computer hardware, software and other requirements for building a viable technological infrastructure to support a typical agency-level information system:

GROUP A = Software				
	System Software	**Price**	**Special Price for Charitable Organizations**	**Notes**
A1	**Microsoft Windows XP Professional** (Upgrade version) Each workstation computer Main uses in a self-contained office, branch office or headoffice: ¨ Networking ¨ Messaging ¨ Accessing database remotely located in head office	$260	$100	¨ Upgrade version is for upgrading any version of Windows since Windows 98 ¨ OEM version (preinstalled full version) is supplied by computer manufacturer, and is not usually available for retail sale. ¨ Windows XP Home, lacking important security and communication features, is not suitable ¨ Should include Windows XP Professional when ordering new computers
A2	**Microsoft Server 2003** (Standard edition) Main uses: ¨ Domain networking ¨ Setting up application/database server ¨ Setting up Terminal Services Server (Both Application and Administration modes of Terminal Services are available in Server 2003)	$1,000	$190	¨ Only 1 package is needed for setting up in head office: • Network server • Application server • Terminal Services server ¨ Certain offices with less than 75 computers may find this version more cost-effective than Small Business Server 2003 with additional CALs, depending on agency size and features needed.
	Each Server 2003 CAL (device or user)	$40	$10	
	Each Terminal Services CAL (device or user)	$112	$60	
A3	**Microsoft Exchange Server 2003** (Standard edition) Main uses: ¨ Emailing (using Outlook)	$980	$600	¨ Can be installed in Network Server, if preferred.
A4	**Microsoft Small Business Server 2003** (Standard edition) Main uses: ¨ Setting up application/database server ¨ Networking	$733	$314	¨ Suitable for self-contained office. License for up to 5 users/devices is included. ¨ Additional licenses can be purchased to increase the number of users/devices up to a maximum of 75 ¨ Only 1 package is needed for setting up: • Domain network • Application/database server ¨ Only 1 server computer is needed to host the application and database and to control network
	Each Exchange Services CAL	$94	$6	

GROUP A = Software				
	System Software	**Price**	**Special Price for Charitable Organizations**	**Notes**
A5	System software and network configurations (Small job)	$1,350	$1,350	¨ Up to 3 hours @ $450 – each location ¨ Rate varies between $200 and $450 an hour, depending on region and qualifications
A6	System software and network configurations (Big job)	$7,200	$7,200	¨ 12-16 hours @ $450 – main location ¨ Work includes setting up: • Domain network • Exchange Server • Application server • Terminal Services Server • VPN ¨ Rate varies between $200 and $450 an hour, depending on region and qualifications
	Software Upgrades			
A7	Microsoft's Software Assurance Program subscription	Add 50% to each system software price	Add 50% to each system software price	¨ Optional ¨ Subscribers receive free upgrades for two years of all insured server software
	Office Suite			
A8	Microsoft Office 2003 (Standard edition) – Each workstation computer	$518	$77	¨ Includes Word, Excel, and PowerPoint ¨ Should include Office 2003 (Standard edition) when ordering new computers
	Utility Software			
A9	Norton SystemWorks 2005	$100	$100	¨ Protects against virus and intrusion, keeps files in good working order, manages bad sectors, etc. ¨ One per computer
A10	PCAnywhere version 11 (Host and Client)	$200 (one per location)	$200 (one per location)	¨ For remote support ¨ GoToMyPC or NetSupport Manager is equally appropriate

GROUP B = Internet Service Provider				
	One of the following options:	Cost (One-time)	Monthly Cost	Notes
				¨ Prices vary between regions. All prices are approximate only. ¨ Add to monthly cost extra charges for static IP addresses needed for remote computers connecting to head office Terminal Services Servers to access central databases. Charges can vary greatly between carrier types and vendors. ¨ Add to monthly cost extra charges for additional email addresses, where needed.
	Cable ISP (Best option)		$50	¨ Modem always included ¨ Usually free installation
	DSL ISP (Second best option)		$40	¨ Modem extra ¨ Self installation
	DSL Modem	$150		
	Dedicated phone line		$28	If all the phones in the small office and the DSL modem have to share one phone line, then telephone filters (one per phone) are needed. One time cost is $5 per filter.
	Satellite ISP (Third best option)		$400	¨ Charges can vary greatly between vendors. ¨ Upload and download speeds greatly affected by number of concurrent users. Practical maximum is 2-3 concurrent users. ¨ Signal problems in bad weather condition
	Dish, materials, and installation	$7,000		¨ Prices vary greatly between vendors. ¨ Installation cost also depends on location.
	Dialup ISP (Last option)		$30	Should use thin client software to help offset speed problem.
	Dedicated phone line		$28	

GROUP C = Computer Hardware (Very important to use high quality equipment)			
		Price	Notes
C1	Computer for managing application and database (Application Tower Server) ¨ Intel server grade motherboard ¨ Dual Xeon, 3.2 GHz ¨ 4 GB RAM ¨ Redundant power supply ¨ 2 SCSI 73 GB Seagate hard drives (RAID-1 implementation) ¨ CD ROM drive ¨ 72 GB DAT Seagate tape drive ¨ Onboard video, 100 mbps NIC ¨ Keyboard ¨ Optical mouse ¨ 17" LCD monitor (16ms) ¨ No OS, but Microsoft ready ¨ 3 years onsite next business day service	$5,700	Needed for each agency regardless of number of branches ¨ One dual processor server per 40-50 concurrent users. ¨ Small self-contained agencies with 10 or fewer users may use a single processor server instead ¨ Size of main memory depends on specific application. Upgrade memory if performance is slow. ¨ Price estimate based on Dell's PowerEdge line ¨ Price will change

GROUP C = Computer Hardware (Very important to use high quality equipment)			
		Price	**Notes**
C2	Computer for managing large network in head office (Network Tower Server) ¨ Intel server grade motherboard ¨ Pentium 4, 3.2 GHz ¨ 1 GB RAM ¨ 80 GB, 7200 rpm SATA Seagate hard drive ¨ CD ROM drive ¨ Onboard video, 10/100/1 GB mbps NIC ¨ Keyboard ¨ Optical mouse ¨ 17" LCD monitor (16ms) ¨ No OS, but Microsoft ready ¨ 3 years onsite next business day service	$1,850	¨ Not needed for a small self-contained office running Microsoft Small Business Server 2003 ¨ Not needed for a small branch office running Windows XP Professional workgroup network. ¨ Price estimate based on Dell's PowerEdge line ¨ Price will change
C3	Computer for managing Terminal Services (Terminal Services Tower Server) ¨ Intel server grade motherboard ¨ Pentium 4, 3.2 GHz ¨ 2 GB RAM ¨ 80 GB, 7200 rpm SATA Seagate hard drive ¨ CD ROM drive ¨ Onboard video, 10/100/1 GB mbps NIC ¨ Keyboard ¨ Optical mouse ¨ 17" LCD monitor (16ms) ¨ No OS, but Microsoft ready ¨ 3 years onsite next business day service	$2,430	¨ Install in head office for remote computers to access head office databases. ¨ Key consideration is RAM size. Calculated as 100 Megabyte per user. 4 Gigabyte is needed for 40-50 concurrent users. Adjust RAM size accordingly. ¨ Elaborate VPN setup may require Xeon-class server. ¨ Price estimate based on Dell's PowerEdge line ¨ Price will change
C4	Mini-tower Workstation – Each staff person ¨ Intel motherboard ¨ Pentium 4, 3GHz ¨ 512 MB RAM ¨ IDE 80 GB, 7200 rpm hard drive ¨ CD ROM ¨ Onboard video, 100 mbps NIC ¨ Keyboard ¨ Optical mouse ¨ 17" LCD monitor (16ms) ¨ Windows XP Professional ¨ Office 2003 (Standard edition: Word, Excel, PowerPoint) ¨ 3 years onsite next business day service	$1,270	¨ One for each staff person in agency. ¨ Price estimate based on Dell's Dimension line
C5	Laser printer – Each location ¨ Monochrome ¨ 1200 x 1200 dpi ¨ Networked ¨ 25 pages per minute ¨ 15,000 pages per month duty cycle ¨ 3 years onsite next business day service	$500	¨ Offices with less than 20 workers may need a printer with a higher duty cycle rating ¨ Price estimate based on Dell's 1700n model ¨ Price will change

GROUP D = Technology Refresh Planning (Every 4 to 7 years, depending on equipment) Also applies to technology currently in use in agencies			
		Price	**Notes**
D1	Server replacement	80-85% of original price for servers with similar features	The average useful service life span of servers is between 4 and 5 years. However, replacing or upgrading components may extend the life span for another 3 to 4 years. Decisions to retire or upgrade should be made within the context of performance too vis a vis the current system software, not just economy.
D2	Workstation replacement	60-75% of original price for desktop computers with similar features	The average useful service life span of desktop computers is between 5 to 7 years. Although replacing or upgrading components may extend the life span for another 3 to 4 years, the usually small cost differential might make better sense to replace the whole computer.
D3	Laser printer replacement	70-75% of original price for laser printers with similar features	Laser printers are normally not worth fixing. In addition, the cost to replace the drum could be as high as the cost of a new printer.

GROUP E = Local Area Networks (Very important to use high quality equipment) (One-time cost for each location currently without a viable LAN setup)			
		Price	**Notes**
E1	16-port switch	$80	For locations with more than 16 devices, purchase either a switch with more ports OR multiple units.
E2	Firewall and VPN router	$400	Must be compatible with the broadband service. Important to ask service provider to recommend suitable brands and models. Price is approximate for a good quality router.
E3	Regular Category 5 cable	$30 (For each workstation located within 30 feet of switch)	¨ Assuming 30 feet of cable for each computer. ¨ Fire retardant grade cables cost many times more.
E4	Installation labor	$75 an hour	Rate varies between regions.

GROUP F = Computer Accessories and Other Office Equipment			
		Price	Notes
F1	Uninterrupted Power Supply (980 Watts, 25 minutes) – Each server computer	$800	One for each server
F2	Replacement battery of Uninterrupted Power Supply	$600	Approximately every 3 years
F3	Laser printer toner	$120 per cartridge	Should belong to the supplies budget

GROUP G = Annual Computer Hardware Maintenance and Support			
		Price	Notes
G1	External computer hardware services (on-site)	Approximately 5% of first time total equipment cost	¨ Some vendors may charge as high as 10% ¨ Best is to include onsite service plan in all computer purchases to cover labor and parts. 3-year protection is probably most cost-sensible.
G2	Replacement parts	$1,000	"Quesstimate"

(Footnotes)

[1] See Nico Trocme, Stanley Loo, Butch Nutter and Barbara Fallon, *Client Outcomes in Child Welfare: Phase II*, Centre of Excellence for Child Welfare, University of Toronto, April 5, 2002. (This report focused on measuring child protection service outcomes, and recommended steps for removing data problems in provincial/territorial government information systems found to hinder national outcomes measurement efforts.)

2 Subsequent to the release of the University of Toronto report, HRDC set up a national child protection outcomes working group to launch a pilot project. Five provinces (British Columbia, Alberta, Manitoba, Prince Edward Island, and Newfoundland and Labrador) will be contributing test data, in accordance with the definitional intent and requirements of the University of Toronto's *Child Welfare Outcome Indicator Matrix*.

3 *Streamlining First Nations Reporting to Federal Organizations*, Report of the Auditor General of Canada, December 2002 (Internet version at: http://www.oag-bvg.gc.ca/domino/reports.nsf/html/20021201ce.html)

4 18 in Alberta, 25 in British Columbia, 15 in Manitoba, 9 in New Brunswick, 1 in Newfoundland and Labrador, 1 in Nova Scotia, 11 in Ontario, 24 in Quebec, and 15 in Saskatchewan. Northwest Territories, Yukon, Nunavut and Prince Edward Island have none.

5 Since a list of agencies that have their own information system did not exist, the only way to identify them was asking FNCCSC's regional contacts to find these agencies. The names of those agencies willing to be interviewed were given to the researcher, along with contact information. The same approach was used to recruit agencies that used a provincial system exclusively.

6 If the respondent wanted to be more prepared, the researcher would email a list of questions to him/her well ahead of time.

7 On four occasions, the contact invited one or more colleagues to sit in at the interview, in order to be able to readily provide more accurate or technically complete answers. This arrangement helped to produce better responses and save time.

8 The reader might be interested in knowing that running tests on database data, a strong and technically involved design feature of the recent nationwide review of provincial/territorial child protection information systems, allowed us to uncover many technical shortcomings in a number of government systems.

9 They were key agency officials, government officials directly responsible for implementing or managing provincial child protection information systems, and suppliers of technology to FNCFSAs.

10 Compared to other provinces, New Brunswick may have the highest number and proportion (9 out of 11, or about 80%, according to a government contact) of agencies that still use a paper file system and are not connected to the provincial system at all. The actual situation in Quebec is difficult to determine, and usage figures for that province are not available.

11 Ontario does not have a provincial child protection information system, although this situation will change when the government introduces an integrated system, perhaps a few years later. This data system project is in the planning stage, and a request for proposals will be issued shortly, according to a government source. Absence of a government information system has given rise to a proliferation of private systems in the province. Currently, most of the 53 CASs (Children's Aid Societies) use a system supplied by one of two consulting firms. Eight First Nations agencies in Ontario use *Frontline*, a dedicated child welfare information system also installed in 60% of the CASs. The other system is *CWIS (Child Welfare Information System)*. The four largest CASs in the province use a private system developed in-house years ago.

12 Criteria used by the government for worker certification varies somewhat between provinces, but level of former social work education and training is an important one.

13 It is likely that access to certain non-financial modules is also denied.

14 The real capacity of these systems cannot be ascertained because we did not have an opportunity to analyze the database structures, the applications, and the database data, among other things.

15 Development work started in 1994.

16 It is also possible that some agencies still use 486 computers or Microsoft DOS.

17 See the University of Toronto final report for details. Advantages of client/server computing and RDBMSs were described in an interim report of that project.

18 Characteristics of the information system: Information gathered included details about the database management system used to build the database and drive the application; types of computer technology deployed; languages used to develop the application; history of application development; main functions of the application; user training; and plans for further development. Capacity of the information system: Information gathered included types and amount of data stored in the database; availability of data needed to measure outcomes; database structure; data integrity enforcement; and coding scheme. An important part of that review involved extracting large datasets from each information system and running extensive usability tests on the data to uncover problems and pinpoint errors.

19 Child in care is noted, but not number of placements nor placement change dates.

20 Salaries and benefits of agency technical support staff are extra.

21 According to Microsoft's current price. Federally registered charitable organizations are eligible for drastic discounts.

22 See footnote #3.

23 An earlier study of Ontario information systems revealed that only one commercial information system had all the data needed, which could be retrieved easily.

24 Trocme, Nico, McPhee, D, et al., *Ontario Incidence Study of Reported Child Abuse and Neglect*. Toronto: Institute for the Prevention of Child Abuse, 1944.

25 Trocme, Nico, et al., *Canadian Incidence Study of Reported Child Abuse and Neglect*. Ottawa: Health Canada, 2001.

26 It is difficult to specify what features should be included in an information system. The usefulness of a system must be decided by the user. However, we should advise that, although inclusion of enterprise level features like human resource management, payrolls, and fleet management is important from the point of view of a comprehensive information management system, these additional features should be managed separately given their specific nature and purposes. As a general design principle, a good database should include only modules intrinsically related to each other and whose data need to be linked to each other. Since a child protection information system is child-based and family-based, only those modules directly or indirectly linkable to a child or a family should be included.

27 If the application is for web or local deployment, it does not matter whether the RDBMS is a client/server system or a file server system. 32-bit engines should be adequate for FNCFSAs.

28 Such flexibility would also take care of what the Auditor General of Canada called "report creep", where the introduction of a new program invariably adds to reporting requirements.

29 The amount of memory is a function of the number of concurrent Terminal Services clients. 2 GB should be able to handle up to 20 clients.

30 The same idea applies to complex organizations and governments as well, although enterprise versions of system software are needed and elaborate security measures are usually involved. In addition, mainframe computers and high-end servers may be deployed, especially in a government computing environment.

31 Items D1, D2 and D3 in the table below and in Appendix B concern technology refresh planning.

32 Most, if not all agencies use Microsoft software products. Therefore, the hardware and software we recommend support this strong tendency.

33 See Appendix B for details and costs.

Extraordinary Costs and Jurisdictional Disputes

CHAPTER 6

Prepared on behalf of:
First Nations Child & Family Caring Society Canada

Prepared by:
Dr. Gerald Cradock, University of Windsor

July 2005

Executive Summary

Jurisdictional disputes and extraordinary costs are endemic to all bureaucratic apparatuses. However, it is not always clear where the boundary between the two terms lies. For the purposes of this analysis, a distinction is made between extraordinary events that are unanticipated, unforeseen, or outside normal risks, from events that appear extraordinary because they lie outside or between established jurisdictions.

Since Directive 20-1 is a national formula, it is not surprising events classified as extraordinary for many First Nations agencies are in fact quite ordinary for some agencies. This is particularly true where agencies are responsible for remote communities with their high incidence of community dysfunction and high travel costs.

Distinguishing between extraordinary and ordinary local events can only be done through the application of community capacity studies, which will provide a guide to the particular needs of the communities serviced by agencies.

The data from this study suggest there are two primary types of jurisdictional disputes plaguing First Nations agencies. First, persistent disputation between INAC and Health Canada over funding for non-insurable medical costs leads to denial or unnecessary delay in the provision of services to children in the care of agencies. In particular, children with complex developmental, mental health, and physical health issues suffer from these delays. Second, some agencies report disputes between themselves and provincial counterparts due to insufficient funding to cover provincially mandated services, demands by provincial actors for agencies to take responsibility for children not recognized by INAC, and disputes over appropriate case practice.

The effect of jurisdictional disputes is to divert staff effort and agency funding from targeted activities and toward dispute resolution. Moreover, the incidence of jurisdictional disputes is highly variable across agencies suggesting some agencies find themselves in a disputing environment in which there appears to be a minimum of cross-agency cooperation. Further, data shows a rough correlation between frequency of disputes and the degree to which agencies service remote communities.

Suggested mechanisms for preventing or resolving jurisdictional disputes include; conducting community capacity studies, establishing interagency committees at local, regional, and provincial levels (with adequate funding for necessary travel), funding for mediation between disputing parties as necessary, and establishing an officer responsible for advocating on behalf of on reserve children.

Data on extraordinary costs does not reflect events that are unanticipated, unforeseen, or outside normal risks. Rather, the data is very similar to that considered under jurisdictional disputes and suggests that much of what is considered 'extraordinary' is, in fact, a body of predictable and repetitive events for which no established jurisdiction can or will take responsibility. For example, complex medical needs are mentioned both as jurisdictional disputes and as extraordinary costs. Yet, the incidence of complex medical needs is calculable and therefore not unexpected.

That said, some agencies report the periodic outbreak of community crises related to sudden high rates of suicide, substance abuse, or other socially destructive behavior. These crises are sudden in the sense they depart from community norms and therefore constitute a major drain for agencies already overstretched by their ordinary commitments. It is important to recognize that these kinds of crises cannot be managed by casework insofar as the dysfunctional unit appears to be the community as a whole, rather than its individual members.

Further, while not noted by agencies surveyed, there are a range of possible extraordinary costs that have been experienced by other child welfare jurisdictions. These include exposure to legal liability, required involvement in public inquiries, and social consequences of natural disasters. The two former types of extraordinary costs are in the nature of moral hazards insofar as while their occurrence is random they are nevertheless

intrinsic to the child welfare enterprise.

It is also evident that little attention has been paid to the cost implications of making reserve communities accessible for disabled children. These costs are not restricted to individual residences, although that is an issue, but also to general civic improvements.

From the perspective of jurisdictional disputes and extraordinary costs a major requirement is a better relationship between Health Canada and INAC. Cooperation between these two federal agencies would save considerable effort and expenditure currently falling to agencies. Some of the cost issues can be addressed by re-jigging Directive 20-1 to more accurately reflect the actual costs of delivering child welfare services. In particular, recognition of the enormous costs of travel for agencies servicing remote communities and a graduated maintenance schedule recognizing the existence of complex needs and the guardianship responsibilities they entail. Similarly, the formula must provide for recognition of the differing responsibilities created by varied provincial legislative regimes.

Finally, it is significant that the on reserve population of children do not have a designated minister or officer dedicated to advancing their interests. This is unique in Canada. In particular, the lack of an ombudsman or advocate for First Nations children places them out of step with the U.N. Declaration of the Rights of the Child and many provincial jurisdictions. It is the position of the author that jurisdictional disputes and the extraordinary costs they generate are likely to persist so long as there is no government supported independent voice dedicated to solely to advancing First Nations children's interests.

Introduction:

The following paper is organized into four parts. First, I provide an overall discussion of how we might think about extraordinary costs and their relationship to jurisdictional disputes. In the second section I turn to surveyed agencies' responses and consider the types of jurisdictional

disputes which are so common as to not meet the test of 'extraordinary' since these disputes are not unanticipated, unforeseen, or outside normal risks. However, I also underline that that which is ordinary for some jurisdictions is abnormal for others – and this is particularly true of travel costs to remote communities and the kind of services which, at present, are legally mandated yet practically impossible to deliver. I follow this with a section concerned with extraordinary costs as described by agencies. Again, I try to distinguish costs which are truly extraordinary from those that ordinary but not addressed by current funding and staffing arrangements. Each of the second and third sections includes a summation of the issues raised and observations about how to address them.

I conclude the paper with a distillation of the paper's findings into recommendations with respect to improving funding under Directive 20-1 and a call for budget lines not contemplated by the Directive. I recognize it is a preferred strategy to improve rather than eliminate the conditions of Directive 20-1 but the reader will realize that the subjects of extraordinary costs and jurisdictional disputes presuppose failings or gaps in the present formula. While some of these problems can be addressed by tinkering with present budgetary procedures, there are issues which have arisen for First Nations agencies which clearly were not contemplated by the authors of the Directive and cannot be addressed by an adjustment to current structural arrangements. However, I hope the reader will appreciate that where possible I have suggested changes which could be addressed under the current structural regime; the rest is perhaps a longer-term project but, I hope, worth the effort.

Locating the Extraordinary:

The past several decades have seen an explosion of "assessment" tools and an accompanying theoretical literature on what should be assessed, how assessments should be constructed, and what purposes assessments should serve. In general, assessments are constructed around one or more of three concepts: risk, needs, and capacity (sometimes called strengths). However, no matter which concept is predominant, all assessment tools work from a normative base. Sometimes this normative base is constructed from expert opinion, other times it is constructed from specific and local research designed to create a baseline of present conditions. Participatory Action Research seeks to combine baseline research with a political agenda of change.

The majority of tools utilized by child protection systems use as their object either parents, children, or some combination of the two. This is true whether the central concept utilized by the assessment is risk or needs. Where community appears in these types of assessments, it is not, in and of itself, subject to assessment. Rather, community appears as a given and what is measured is not community functioning but the child's or parents' involvement in this assumed community. Effectively, this approach conceives of parents and children as more or less defective liberal citizens situated within interchangeable healthy communities.[1]

INAC recognizes at least one distinction between reserve communities – degrees of isolation. Its basic departmental data utilizes four categories (urban, rural, remote, and special access) based upon geographic distance from a 'service center' (INAC 2003, 94). While not overtly stated, this classification system appears to assume quality of life is related to accessing services contained within a service center. However, there is no reason to assume this single dimension is an adequate measure of quality of life or that it is capable of distinguishing between healthy and toxic communities.[2]

The significance of this observation is central to the conception of extraordinary costs. An assessment scale designed to assess only parents, or only children, without taking account of community functioning will necessarily create distortions. It is reasonable to suggest that a child presenting objective extraordinary challenges (for example, autism, F.A.S.) will be much more likely to become a child in care if the challenges occur within a community with low child welfare capacity. On the other hand, if the community contains high capacity the child's objective challenges may present less difficulty and, hence, not be extraordinary.

Further, the conception 'child welfare capacity' is not limited to professional assistance or intervention. In theory, a healthy community would not require professional assistance or intervention because it would have its own internal capacity to address problems and issues as they arose. Within the First Nations context, the frequently cited importance of extended family indicates Nations composed of healthy extended families would not require professional intervention – or at least not an alternate care system – since healthy extended families would tend to care for their own.

In contrast to child welfare literature, a significant body of community assessment tools has emerged in the population health area (Granner and Sharpe 2004). As well, a variety of needs assessment tools have emerged in the U.K. in response to various central government initiatives designed to ensure local authorities are responsive to the needs of local jurisdictions (for example, see Browne 1996). The examples provided by Percy-Smith (1996) include assessments of community care, community needs, housing needs, access to legal services, and labor market and training needs. Others, such as Oetting et al (2001) have attempted to create a theoretical and methodological base for needs assessment. Meanwhile, Family Support America (Samuels et al 1998) has developed a step-by-step guide for assessing community needs and Christakopoulou et al (2001) have reported an initial international test of reliability and validity for a community well-being questionnaire.

Of urban Europe, Christopoulou et al write:

> *The need for a comprehensive profile of community wellbeing arises from the multiple nature of the problems themselves that many urban neighbourhoods face. Although disadvantaged neighbourhoods are often classified as low income areas, it is a mixture of environmental, social and economic problems that undermine investments and residents' commitment to these areas often encourage social exclusion.* (ibid, 322)

The significance of this understanding of multiple causes of lack of community wellbeing is reflected in the data collected by Trocme et al (n.d.). Here, substantiated child protection investigations on reserve reflect the presence of an average of 4.1 risk factors as opposed to an average of 2.5 risk factors for non-aboriginal children (ibid, 23). Moreover, amongst these risk factors mental health issues occur in 40% of all cases yet the Joint National Policy Review notes that of fifty First Nations child welfare agencies surveyed only eight had contact with mental health agencies (McDonald et al 69). In other words, given the prevalence of mental health concerns in child protection matters it astonishes that in five of nine provinces First Nations agencies had no contact with mental health services at all.

From the point-of-view of extraordinary costs the presence of mental health risk factors for on-reserve child abuse investigations is not extraordinary at all. It is, like alcohol abuse (73% occurrence) and solvent abuse (54% occurrence), virtually normative despite being far in excess of normal occurrence rates in non-aboriginal communities. Given these facts it is unreasonable to assume that on-reserve child welfare services should simply match usual provincial service levels because by this standard all aboriginal communities have extraordinary needs in comparison to non-aboriginal needs. Further, despite the usefulness of national figures, the reported Trocme et al (n.d.) data is not fine grained enough to suggest the distribution of risk factors across the on-reserve population. It is reasonable to suppose that risk factors are, in fact, unevenly distributed across nations and localities.

A funding formula for child welfare agencies must take into account not only the demonstrably greater needs of on-reserve populations, but must also discern differences between First Nations since the determination of what constitutes an extraordinary event or problem cannot be uniform across localities. More precisely, it is not possible to determine which individual cases are extraordinary without reference to local and particular norms.

Risks and Strengths:

Returning to the need for a calculus of risks and strengths within communities, and the question of what appropriate level of funding is required. We might put this graphically in this way:

Statutory Requirements

Risks ----------		---------- funding
	Capacity	
Strengths --------		----available resources

Fig. 1

Higher levels of risk indicate an increased necessity for funding. However, funding does not, in itself, create healthy communities. Therefore, while strengths would presumably positively correlate with available resources this is not a simple equation of more resources equal more strengths. For the present, 'available resources' is meant to reflect expertise and wisdom, the presence of appropriate jurisdictions to address issues impinging upon child welfare, and, perhaps most importantly, adequate networking of available resources distributed across jurisdictional boundaries. In short, available resources are not simply additive; resources become strengths when they knowledgeable and sufficiently networked to create meaningful responses to social challenges.

Required or Preferred?

Despite much effort, there is, as yet, no generally accepted agreement as to what constitutes the minimum number or type of satisfiers of human needs upon which citizens have a universal claim

within a welfare state (Percy-Smith 1996, 143). As outlined in the National Policy Review, there are at least three conceptions of required services under which First Nations agencies must operate: statutory, contractual, and audit formats. In other words, First Nations agencies must comply with applicable statutes, with the conditions of their bipartite and tripartite contractual arrangements, and the financial, record-keeping, and case practices formally reviewed through audit systems. While these requirements vary in their details, the National Policy Review indicates they exist across provincial jurisdictions. In particular, statutes generally agree on broad definitions of child abuse. We make take these requirements as providing for the minimum number of satisfiers required to meet human needs.

The large number of on-reserve children in care indicates a discrepancy between reserve capacity and reserve needs. Clearly, in the judgment of child welfare agencies a high proportion of on-reserve children face an unacceptable level of risk of child abuse. The vast majority of funding directed at alleviating these risk conditions is predicated upon child removal. However, it is not immediately clear whether this strategy is based upon any given reserve's lack of strengths (in which case it is not individual parents who are the source of risk but the community as a whole), a lack of resources (understood as networked expertise and practice), or a lack of funding to operationalize latent strengths and resources already extant. Alternatively, even if sufficient funding for a specific function (say psychiatric care) were available it is not immediately obvious that there would be anywhere to spend it. One can easily imagine a perversity of funding arrangements in which adequate funding for psychiatric care was available but accompanied by insufficient travel funding to get the client to the psychiatrist (or the psychiatrist to the client).

There seems little point in rehearsing the reasons why on-reserve children are taken into care more often than non-aboriginal children. The question that needs to be addressed is what to do about the problem. I suggest that any policy which seeks equivalency between on-reserve services and non-aboriginal services misses the point. It is not the equivalency of services that is required but an equivalency of community capacity to create the minimum number of satisfiers to meet human needs. However, the distinction between required and preferred satisfiers is blurred by what Ian Hacking calls a "looping effect" (Hacking 1995). As an example, it was not so long ago that high school graduation was preferred but not required for the purposes of employment. As more people become aware that high school graduation is possible (and as employment standards come to recognize the possibility) more people come to define themselves as either graduates or drop-outs[3] and this self-definition is colored by the generally held belief that high school graduation is not preferred but necessary.

Consider also something as simple as indoor plumbing. Even in Canada's urban areas indoor plumbing is a relatively recent adaptation. Nevertheless, indoor plumbing has rapidly become a necessity where before it was only preferred. Now consider requirements for foster parents to possess "adequate housing". Presumably, "adequate" in this context would take as its normative referent the provision of indoor plumbing because this is a national norm even though it may not be a local norm. Yet, this national norm is a relatively recent occurrence. This means that an architectural innovation rapidly became a norm beyond the realm of architecture and into the realm of (amongst other things) child neglect. A child raised without indoor plumbing falls below the national norm and, more importantly, comes to be viewed both by him/herself and others as living in inadequate housing.

From this perspective, a major difficulty for reserve populations is the impossibility of "catching up" to ever-evolving national norms. Put another way, reserve populations can never achieve normative community capacity if the resources available to them are predicated upon an assumption of an already achieved normative state. As the colloquialism goes, "it's hard to soar with eagles when you're swimming with alligators".

To the extent that on-reserve populations have failed to realize a normative level of community capacity they are exceptional. Yet, if the entire

on-reserve population has exceptional needs it follows that no on-reserve person has exceptional needs. I suggest this is a major reason why INAC has shown a remarkable reluctance to fund exceptional costs. It may be useful here to acknowledge that this is not a problem restricted to reserve populations. The Windsor-Essex County Children's Aid Society ran into a similar problem when they classified all children in their care as "special needs" (personal communication, April 2005).

Extraordinary Review

The National Policy Review (McDonald et al 2000) noted that there is no uniformity across provincial jurisdictions with respect to reporting and audit functions. This is a problem in itself, but it is also the case that no child welfare jurisdictions are immune to child fatalities or critical incidents. While many of these fatalities and incidents follow a routine form of review (either internal or external to child welfare agencies), it is also the case that occasionally such incidents are brought into the public view (typically through press coverage) and become objects of public inquiries[4]. For present purposes, the importance of these events are a) the impossibility of predicting when and where they will happen, and b) whether the event will remain within normative review processes or will create a public inquiry requiring large amounts of agency time and effort.

First Nations child welfare agencies have not been immune to these sorts of inquiries. The "Baby Andy" case involved both a review panel and a "fact finding" project conducted by the Children's Advocate of Saskatchewan. While not as massive as some inquiries, this review demanded considerable agency time and resources.

The Children's Advocate Office completed independent fact finding by holding interviews with 23 persons from 11 agencies and reviewing documentation from all relevant files and records. This information was compiled and provided to the review panel in February 2003 for thorough analysis. (Saskatchewan 2003, 7)

An inquiry into the 1998 deaths of Constance Jacobs and Tyundanaikah Jacobs at the Tsuu T'ina Nation, Alberta does not give an account of how many people were consulted, however some twenty legal counsel representing various parties participated in the inquiry's activities (Goodson 2000).

Some jurisdictions – notably British Columbia – have experimented with mandatory reviews of child fatalities and critical incidents by independent or quasi-independent bodies[5]. These policies tend to depend for their longevity on the vagaries of press coverage and provincial government's political problems. In any case, for present purposes the main point is that inquiry involvement is largely unpredictable, outside First Nations control and, most importantly, expensive in terms of both funding and time. Social workers and administrators who participate in inquiries are taken away from their normal tasks in order to service the requirements of inquiries. Additionally, such inquiries typically occur within very public and highly charged emotional situations. Staff moral is almost always adversely affected resulting in loss of productivity.

Concluding Remarks

The foregoing section has attempted to highlight the difficulty in conceptualizing what the category 'extraordinary' contains in the context of child welfare. A principle difficulty is the high level of need demonstrated by many First Nations communities. Many events that might be described as extraordinary in the overall Canadian context are, in fact, quite ordinary in First Nations' experience. That said, it remains to be seen how uniformly such events are distributed across the universe of First Nations. In any case, the argument has been made that it is impossible to identify extraordinary events without an assessment of the overall capacity of communities using available tools.

This analysis has been necessary in order to distinguish the projected greater needs of First Nations' communities from their off reserve counterparts. If, as is indicated by available

research, First Nations communities are generally high needs then the prospect of simply matching services available off reserve will always leave First Nations resource poor. In turn, the discrepancy will generate extraordinary costs due to predictable jurisdictional (service) gaps. What is needed is a philosophy of matching services to particular needs, rather than matching services to a presumed provincial average. In any case, matching service provision to provincial equivalents must result in varied service provision across provincial boundaries where those services are subject to differing legislative, policy, and audit regimes.

Moreover, as discussed in the final section, extraordinary events such as child fatalities can rapidly lead to expenditures of time and funds for activities demanded by inquiries. These inquiries are impossible to predict because they tend to be struck in response to the passing interests of parties normally outside the child welfare universe. This is particular true of the press whose interest in any particular case is dependent upon a variety of commercial pressures (i.e. competing stories) but nevertheless can exercise considerable public pressure. This point will be further argued below, but for the moment it is important to recall that it is not child mortality per se that is extraordinary – rather it is the public reaction to specific children's deaths that is extraordinary.

Anyone familiar with public inquiries into child welfare recognizes the repetitive plea for better communication and better coordination across jurisdictions. Conceivably, most extraordinary events are, in fact, not extraordinary at all. Rather, they are events for which bureaucratic and service responses are lacking. The following section takes up this theme in greater detail. It will argue that many events characterized as extraordinary are quite common occurrences. What makes them extraordinary is the degree to which jurisdictional disputes hamper, delay, or prevent appropriate service delivery.

If we can locate persistent jurisdictional disputes in the same terrain as persistent extraordinary costs then it ought to be possible to identify service gaps. Such service gaps are distinguished from extraordinary events because they meet none of the criteria defining extraordinary. That is, they are not unanticipated, unforeseen, nor outside normal risks.

Jurisdictional Disputes

Frequency

Aggregate data indicates all but one of the study agencies experienced jurisdictional disputes. The frequency of these disputes varied from 1 to as many as 165. Over a year, resolution of each dispute took anywhere up to 200 hours of staff time with half the reporting agencies dedicating 10 to 150 hours as usual.

Frequency of jurisdictional disputes is not reflected in the amount of staff time required. For example, one agency reported only one jurisdictional dispute but this engaged four staff members for an estimated total of 150 hours. The lowest estimate of staff time per dispute is two hours. By far the largest estimate of staff time dedicated to jurisdictional disputes was 200 hours per dispute of a total of 32 disputes, necessitating a total staff commitment of 6,400 person hours. The highest estimated total number of disputes per year was 165 at an estimated 20 hours per dispute totaling 3,300 hours.

Data from the studied agencies did not specify time per occupational classification. Therefore, it is not possible to give an overall dollar cost for staff time although it is possible to calculate costs for reporting agencies in terms of Full Time Equivalents (FTEs). Based on a 35 hour week, agencies reported a low of 0 FTEs to a high of 3.5 FTEs required for resolving jurisdictional disputes.

Types of Disputes:

One agency reported only disputes between the federal and provincial governments. These disputes are reported to be over "kinship care". It is not clear what the exact nature of this dispute was, but it may be that there is no provincial equivalent to the federal Guardianship for Aid (GFA) program or possibly traditional adoption. Insofar as the GFA does not require child protection authorities to take custody of children this may be better phrased

as a dispute over preventative services rather than funding for children in care's residential or clinical requirements.

Six of nine studied agencies reported jurisdictional disputes between federal ministries/departments primarily due to disputes between the Ministry of Health and INAC over Non-Insured Health Benefits. By contrast, only one agency reported disputes internal to provincial governments (5 disputes).

Four of nine agencies report disputes between the agencies and provincial programs. Significantly, two of these agencies report from the same province (British Columbia). Further, where jurisdictional disputes between agencies and provincial governments occur, they comprise the largest proportion of disputes (although in two instances, frequencies of disputes between federal agencies/ministries and disputes between agencies and provincial governments are reported as identical.)

Three agencies report internal jurisdictional disputes i.e. between different First Nation programs, but the total number of disputes is minor in comparison to disputes between federal agencies and agency disputes with provincial governments.

Four agencies report disputes between themselves and the federal government. Again, in general these disputes are relatively minor in terms of the proportion of total jurisdictional disputes.

Overall Observations

Where jurisdictional disputes occur, the overwhelming incidence is concentrated in two areas. First, disputes between (a) federal agencies and second (b) disputes between First Nations' agencies and provincial governments.

a) For disputes between federal agencies, examples provided by reporting agencies show disputes are largely concerned with funding disputes between Health Canada's First Nations and Inuit Health Branch (FNIHB) and the Indian Affairs Department of INAC. The general impression is that First Nations agencies find these disputes particularly frustrating since while they are not party to the dispute, they are responsible for the health and care of the children in question. One can easily infer that because neither FNIHB nor INAC have direct responsibilities for children they do not experience the sense of urgency felt by First Nations agencies.

The problem of disputes between federal ministries may also be related to location. Problems of jurisdictional disputes between federal ministries are more likely to occur for agencies responsible for remote communities. One might infer, therefore, that problems of transportation and communication play a part in creating and extending jurisdictional disputes. For example, where there is a pressing need for diagnostic services in remote communities, and where this need is associated with lack of local resources, the dispute is likely to revolve around both large transportation costs and the scale of the demand. In other words, remote communities tend to have large numbers of undiagnosed disabilities (particularly FAS) which, at the very least, must create an enormous backlog of referrals.

b) Jurisdictional disputes between First Nations agencies and provincial governments are not widespread – occurring in only three of nine provinces. However, where they do occur, they consume a considerable amount agency time. Comments accompanying the survey suggest several sources of conflict. First, inadequate funding for First Nations' agencies to absorb the influx of responsibility associated with agencies receiving delegation. Second, disputes over the limits of First Nations' agencies capacity – what one agency described as provincial governments' "dumping cases". Provinces seem to expect First Nations' agencies to take responsibility for all band members irrespective of whether the members are recognized by INAC as reserve residents and therefore eligible for federal funding.

That said, a major source of jurisdictional disputation does not involve money, but practice. That is, First Nations' agencies report their provincial counterparts either do not keep them informed as to members' involvement with

provincial systems (and if they do, they assume First Nations' consent for provincial protective action) or do not employ 'least intrusive' strategies and tactics such as variations of kinship care.

Of course, while these latter types of dispute do not entail direct maintenance costs to First Nations' agencies, they do absorb a considerable amount of staff time (from a low of 10 hours per case to a high of 200 hours). Funding for staff time is presumably drawn from maintenance budgets for children in care of agencies and therefore the cost of these disputes is effectively transferred from children in the care of agencies and to provincial social work and judicial apparatuses.

Disputing Cultures?

It is remarkable that some First Nations' agencies report an enormous resource drain due to jurisdictional disputes while one reports no disputes whatsoever. Moreover, of the nine agencies surveyed, four identify only one type of dispute and three of those concern disputes between federal ministries, not disputes between the agency and some other entity. Further, of these latter agencies the number of disputes is significantly lower (to a maximum of 5 per year). By contrast, agencies reporting multiple sites of jurisdictional disputes report between 17 and 30 disputes per year except for one agency reporting a staggering 165 disputes[6].

The frequency and distribution of jurisdictional disputes has no correlation with either the number of children in care or the educational attainment of social workers. Instead, the best predictors of high rates of jurisdictional disputes are a) disputes between FNIHB and INAC and b) agencies and provincial jurisdictions where provincial policy and/or statute requires agencies to undertake tasks not funded by INAC. Related to the latter are disputes over best practices. On the one hand, agencies are not funded to perform tasks mandated by provincial legislation, while on the other hand agencies view provincial authorities as failing to encourage least intrusive strategies or to utilize traditional forms of alternate care.

In short, First Nations agencies reporting multiple jurisdictional disputes seem to be engaged with a wide range of disputes leading one to suspect either a) a general breakdown between all levels of government – including to some extent internal band government, or b) some agencies have not been able to create a non-disputing persona. This is not to suggest such agencies engage in disputes without substance, but rather certain characteristics of their particular situation either induce disputes or prevent dispute resolution[7].

It is possible that variation in reported jurisdictional disputes is not so much a measure of actual disputes but a measure of whether agencies create either a trust relationship or a bureaucratic routine with federal departments. For example, an agency reporting no jurisdictional disputes makes the following comment:

INAC and Health Canada fight, but agency sends bill to INAC and gets reimbursed. INAC then sorts it out with Health Canada. Almost anything with a medical component triggers a dispute. Agency is protected by a clause in its agreement.

Whatever the clause in the agreement is, it is clearly not a national clause because this is the only agency which considers disputes between INAC and Health Canada to be of no consequence to the agency itself. Hence, because the dispute is contained within federal departments no agency effort is directed at resolving the dispute.

The principle disputes at issue then are as follows.

1) Disputes between FNIHB and INAC which delay or withhold necessary non-insured health benefits to children.
2) Disputes between agencies and provincial authorities over the provision of services demanded by provincial legislation and/or policy but which is not reimbursed or contemplated by INAC policy.
3) Boundary disputes over which authority is responsible for particular children. Frequently these disputes are rooted in whether children or their parents are 'resident' on reserve

and the funding issues that flow from that determination. One agency reported these disputes can include the question of whether a child's parent died on or off reserve. These disputes include provincial authorities 'dumping' cases.

4) Disputes over appropriate practice. This is related to above insofar as agencies may view the range of provincial legislative or policy requirements as too limiting of culturally appropriate solutions. On the other hand, these disputes may also be based upon differing conceptions of safety thresholds and family strengths – that is to say, case management practice.

Structures for Resolving Jurisdictional Disputes:

Jurisdictional disputes may be solved through a continuum of strategies ranging from the informal to the formal. The best strategy depends upon the interests of the disputing parties, the relationship between the parties, the nature of the dispute, and whether the solution to any particular dispute ought to be general and binding on all similar disputes. The Province of Quebec identified a section of the responsible ministry (MSSSQ) whose task was negotiating intergovernmental issues. However, the Quebec based First Nation agency did not identify this division as resolving jurisdictional disputes. It seems the division is less a forum for resolving disputes than an arm of the provincial government specializing in negotiating with other governments on behalf of the Province of Quebec. While it is certainly useful to identify a specific part of government responsible for resolving disputes, this should not be confused with the actual resolution process itself[8]. Below I outline several possible processes and suggest the kinds of disputes they are best suited for.

Avoiding Disputes: Community Assessments:

The best way to resolve disputes is to try to prevent them from arising in the first place. There are several ways in which jurisdictional disputes might be avoided.

No policy initiative or shift in governmental responsibilities can anticipate all possible jurisdictional difficulties; however disputes often arise because of poor planning[9]. Above I alluded to the importance of conducting community capacity assessments. Indeed, it is striking that of the agencies surveyed, a community assessment was completed by only one agency apparently due to its block funding arrangement. By contrast, FNIHB insists that the first task of local delivery of health services is to conduct a needs assessment study and has created a handbook to guide local actors. The handbook's first paragraph makes the following point:

> Identifying home and community care priorities and needs through a community needs assessment is an important activity that needs to be conducted at the beginning of program development. Whereas word-of-mouth can be helpful for getting the idea for the program going, a needs assessment study provides a comprehensive and unbiased documentation of the needs in the whole community. (emph. in original) (Health Canada, [3])

The importance attached to community needs assessments by Health Canada is not surprising given the entrenchment of the population health paradigm within public health programs. However, it is also striking that children are almost entirely absent from FNIHB program strategies and goals. Indeed, with the exception of the Aboriginal Head Start program, and a brief flurry of training around FAS, children are entirely absent from FNIHB's literature. More precisely, the particular health needs of children are subsumed within general categories such as dental, vision; medical supplies and equipment, and so forth.

The absence of children as a category from FNIHB's literature is significant because it blinds medical practitioners to the physical and emotional consequences of child abuse and neglect. More precisely, it suggests abuse and its consequences are not FNIHB's responsibility. Since disputes between FNIHB and INAC over health funding for children in care are a major problem, it may be

that the genesis of these disputes is to be found in the lack of attention paid to child abuse and children in care by community needs assessments conducted within the population health paradigm.

The value of community assessments does not solely lie in their identification of community needs. Literature concerned with community assessments suggests that community assessments are themselves a mechanism for building community strength because they rely on the identification, mobilization and networking of key community members (Kelly et al 2003; Oetting et al 2001). Thus, community assessments not only collect objective information but they also play a part in establishing a shared mission and philosophy which is then widely distributed throughout the community. A community assessment that takes into account the social sphere as well as the medical sphere ought to result in both a clearer understanding of the health needs of parents and their children, but should also assist in developing cooperation between health care and social service providers. In turn, this ought to result in fewer jurisdictional disputes and therefore less time required for servicing disputes.

For all its emphasis on competition, business literature recognizes the central place of trust in economic relationships. This is because it would clearly be too expensive and too time consuming to litigate every dispute. Further, many business disputes arising from professional activities are too difficult to specify in terms of end product and therefore are virtually non-justiciable. The variable rates of jurisdictional disputes reported by agencies may well be a reflection of the presence or absence of trust. The comment by one agency (referred to above) that it trusts FNIHB and INAC to work out their funding arrangements – albeit with contractual support – indicates the importance of inter-agency trust. Note also this trust works both ways; presumably in this instance INAC trusts the agency not to bill for frivolous or unnecessary medical services. A major benefit of community assessments then is the opportunities they create for building trust relationships.

Managing Disputes: Committees:

Bureaucracies are ever faced with the task of imposing rational order upon the disorderly nature of lived experience. Bureaucratic rationalism requires the bounding of human experience within specified categories of action and under the domain of specified areas of expertise. It is perhaps the great irony of bureaucracies that in order for them to function at all they must divide experience into manageable parts. As Nikolas Rose (1999) has remarked, this results in rational bureaucracies resembling Tinguely's fantastic machines filled with independent and often borrowed parts that while seemingly randomly connected nevertheless get things done.

Bureaucratic classifications of experience and expertise tend to create departmental isolates. For one department a client is a set of teeth, for another a problem to be transported, and for a third a risk of child abuse. As each department attempts to sustain its own isolated rationality it may find itself at cross-purposes with other departments where the overall result is either nullification of action or the misuse of extant programs in order to address a service vacuum created by another department's policies.[10]

The usual response of bureaucracies to identifying, preventing, or resolving bureaucratic jurisdictional disputes is the committee. In theory, a committee is capable of reassembling the bureaucratic whole through representatives of departments and expert domains. A standing committee recognizes that some jurisdictional disputes are likely never entirely resolved at least in part because every bureaucratic system must cope with anomalies and exceptions on a case-by-case basis.

Committees are successful when they are a) fully attended by their members and b) based upon high trust between their members. Both of these factors have costs associated with them. Full attendance requires adequate funding for time and travel costs. Where time commitments are large this will have a 'knock-on' effect in terms of back-fill. Travel costs require a recognition that funding is directed at abstract goals – that is to

say, it is unlikely that 'trust' can be conceived as a measurable good and therefore would be opaque to value-for-money audits. Further, these costs will be higher for agencies servicing remote communities since travel will be both more extensive and more difficult. However, the reader will recall that frequency of disputes seems to be positively correlated with degree of isolation. If we can accept that trust relationships are more likely to occur in face-to-face relation than through communication technologies located in isolated areas, then a standing committee structure is likely to enhance trust relations and therefore reduce jurisdictional disputes. [11]

As we have seen, the bulk of jurisdictional disputes concern either disputes between INAC and FNIHB (in which agencies are caught in the middle) or disputes between provincial governments and agencies often due to lack of INAC funding for provincial legislative and policy requirements and exacerbated by a lack of understanding of these limitations on the part of provincial officials. Hence, a standing committee structured to require attendance by these three bureaucratic spheres ought to lessen at least some jurisdictional disputes. I have in mind an hierarchical structure composed of local, regional, provincial, and possibly national committees in which disputes that cannot be resolved at one level may be raised to a higher table.[12]

It is possible to build in an incentive to standing committee's effectiveness by attaching a budget line. That is, a separate discretionary budget for family and children's services accessible solely through the committee and requiring some form of quorum or consensus. I will address this further under the heading of 'Extraordinary Costs' since as I have argued above many extraordinary costs are not in and of themselves extraordinary but, rather, costs outside established jurisdictions and budget lines. That is to say, they are often boundary cases because they partially fit many budget lines but wholly fit within none.

Resolving Disputes: Alternative Dispute Mechanisms

In the movie "Cool Hand Luke" the prison warden explains his brutalization of a prisoner with the phrase: "What we have here is a failure to communicate." Alternate Dispute Resolution mechanisms (ADR) are predicated upon the belief that most disputes are rooted in failures to communicate resulting in a perception by at least one of the disputing parties that they have not been heard – if not brutalized. ADR can take several different forms with arbitration, mediation, and their several sub-forms being predominate. There are two main advantages of ADR over litigation. First, ADR tends to be informal and therefore has more discretion as to what factors (particularly emotional factors) are important and tends to be less expensive than litigation. Second, ADR seeks to create win-win situations through creative solutions where litigation creates win-lose solutions defined within legal parameters and procedures.

However, there are some important negative characteristics of ADR that ought to be kept in mind. First, ADR works best when it is voluntary. Parties who engage in coerced ADR have no stake in the process and therefore the whole philosophy of ADR is undermined. Second, informal procedures provide little protection where the parties enter ADR from unequal power positions. The formality of judicial procedures does provide a hedge against bullying or extortive behavior. As well, ADR can lead to solutions that are less advantageous than legal precedent expects. Third, ADR is often time limited, meaning there can be unreasonable time pressure on parties to reach an agreement irrespective of whether or not it is fair. Fourth, ADR tends to lead to "split-the-difference" solutions on the theory that half a loaf is better than no loaf. However, for the sorts of disputes under consideration here, half a prosthetic device or half a counseling regime (for example) is no solution at all.

Finally, mediators and arbitrators are typically selected by consent of both parties. Since some parties (i.e. insurance companies) frequently find themselves in ADR they tend to hire many more mediators and arbitrators than the other disputant.

In turn, mediators and arbitrators operate within an economy of ADR and it is only natural for them to either consciously or unconsciously attempt to please their primary customers.

Nevertheless, ADR can be a useful mechanism for resolving persistent jurisdictional disputes because of its emphasis on win-win solutions. And, the cost savings over litigation or the persistent drain of staff time due to unresolved disputes may make ADR an attractive alternative to both disputing parties. Nevertheless, while ADR may be cheaper it is not free. Nor does it necessarily save on legal fees insofar as many parties engaging in ADR are wise to engage the services of a solicitor to ensure both the process and settlement are fair. The extent to which agencies can expect to engage in ADR is dependent upon their current dispute frequency and their anticipation of further disputes arising due to government policy changes[13].

From a budgetary perspective, it is unlikely that ADR could be planned for on a global basis since, as we have seen, the frequency of jurisdictional disputes are highly variable. It seems more reasonable that agencies with a history of disputes would need to create a separate budget line (or claim against INAC) based upon their particular situation. From the perspective given here, what is important is that such a budget line be created for those agencies able to demonstrate the need.

Some may argue that to create such a budget line would be to encourage disputes rather than the smooth operation of jurisdictional cooperation. While I certainly allow for the possibility, I find this concern unfounded because it fails to take account of a secondary byproduct of ADR. Pavlich (1996) points out that a major goal of ADR is to teach participants how to resolve their own conflicts – what he calls the creation of non-disputing selves. The reader will recall that I have speculated above that the extraordinarily high number of disputes reported by a minority of agencies seems to suggest a culture of dispute. If Pavlich is right, then a major reason for this culture may not be the objective conditions under dispute but the lack of skills and trust available to the disputing parties. In theory, ADR provides a forum for disputing organizations to acquire a non-disputing persona by gaining skills and enhancing future trust relations based upon the increased likelihood of win-win solutions. At the very least, a skilled mediator ought to be able to increase the level of trust due to their practice goal of having each party hear and understand the position of the other party.

Formal Advocates and (Child) Rights Approaches

The United Nations Convention on the Rights of the Child, ratified by Canada in 1991, is generally accepted as a watershed moment in defining the relationship between the state and children. In its wake, the Convention has created a number of reporting requirements and advocacy apparatuses designed to monitor and report on states' compliance with the Convention's requirements. According to Canada's Second Report on the Convention of the Rights of the Child (Canadian Heritage 2003) there were five Canadian provinces with some form of advocate, commission, or ombudsman dedicated to insuring governments act in accordance with the Convention[14]. Other provinces identified a specific minister designated to act on behalf of children's rights.

The federal government does not have a single ombudsman although a number of ministries and departments have their own internal ombudsman. (Interestingly, the staff of INAC has recourse to an internal ombudsman.) Since Canada's constitution assigns governmental responsibility for social services and children to the provinces, the federal government does not ordinarily have any requirement for a child advocate to monitor its own policies and procedures. However, the situation of First Nations children is different since the federal government retains a fiduciary duty toward them. This anomaly means that First Nations children on reserve are the only children in Canada for whom no authority is designated as responsible for them, and they are among that proportion of children who cannot call upon an independent body dedicated to speaking on their behalf. Given that a significant number of jurisdictional disputes concern disputes within the

federal government the absence of an independent voice effectively means there is no way to leverage policy and procedural change for the benefit of aboriginal children.

By contrast, the recent example of children in care of Ontario Children's Aid Societies due to the government's decision not to fund Special Care Agreements and its subsequent reversal of that policy was largely due to the activities and report of the Ombudsman of Ontario (2005). Similarly, in British Columbia, pressure to change child protection legislation in the early 1990s came in no small part from the release of two provincial Ombudsman's reports (1990; 1991)[15]. Hence, while Ombudsman and other Advocates have no authority to make governments change their policies, the ability of these officers to embarrass government through their public reports can provide an important and effective incentive for change.

The importance of independent voices speaking on behalf of children has been noted by UNICEF:

> …without independent institutions focusing entirely on the rights of children, these rights will rarely receive the priority they deserve. While children are among the heaviest users of public services, they remain the people who are least able to influence the actions of governments. The main task of such institutions is to close the gap between the rights rhetoric and the realities of children's lives, ensuring that rights are translated into law, *policy and practice*. *(emph. added.) (UNICEF 2001, 1)*

Thus, while the Convention explicitly requires states to "strive to ensure that no child is deprived of his or her right of access to such health care services" (Article 24) the reported jurisdictional disputes between INAC and FNIHB seem to amount to such a deprivation. Further, Article 12 requires states to take into account the views of children but in the absence of a designated voice representing the interests of First Nations children this right is more rhetorical than substantive.

The federal government has introduced Bill C-257 titled "An Act to establish a First Nations

Ombudsman and a First Nations Auditor to assist with administrative and financial problems"[16]. However, while Section 2 (a) (iii) contemplates this Ombudsman investigating problems arising "between one or more First Nations communities and the Government of Canada", it is clear the Bill's principle concern is with financial irregularities within First Nations' governments. The Ombudsman's task will not be, as law professor Larry Chartrand has noted, to "monitor non-aboriginal governments' accountability to aboriginal peoples". Further, the First Nations Ombudsman does not have responsibility for investigating difficulties involving individuals – its concern is between First Nations governments and INAC – unless that difficulty is between a band member and his or her First Nation government.

Disputes within the federal bureaucracy are unquestionably the responsibility of the federal government. However, as we have noted, jurisdictional disputes are as likely to occur with provincial authorities. Would a federally constituted ombudsman or child advocate have the authority to intervene in these kinds of disputes? In principle, there seems to be no objection. As has been frequently noted, just because the federal government has not legislated on behalf of First Nations children on reserve does not mean it cannot. This is a choice of the federal government. A federally constituted child advocate would not be inherently restricted to federal government programs since the office's task would be to represent First Nations children – no matter where their concerns lie.

Moreover, as noted above, ombudsmen and child advocates normally do not have authority to make government – in this case either federal or

provincial – change law or policy. Rather, their role is to investigate, report, and, if need be, embarrass governments into action. Further, provincial ombudsmen and child advocates share certain general characteristics. There is no reason to suppose a federally appointed advocate could not participate in a cooperative network of advocates composed of both provincial and federal officers charged with resolving jurisdictional disputes of mutual interest.

Linking Mediation and Advocacy:

In the previous section I argued for a separate budget line that agencies could call on for the purpose of engaging a mediator for jurisdictional disputes. If a federal child advocate were appointed it is possible this advocate could either a) fulfill this role directly, or b) hold the mediation budget line, thus ensuring independence from INAC and provincial governments in the distribution of funding.

Such an arrangement would, of course, be outside the current activities funded by Directive 20-1. However, as I hope to have demonstrated, the present arrangement does little or nothing with respect to providing resources for the resolution of jurisdictional disputes. Instead, if the agency sample is at all representative of general conditions facing agencies, it is clear a substantial amount of funding supposed to used for the maintenance of First Nations children is in fact being directed at resolving jurisdictional disputes.

Furthermore, the repetition within reported disputes (as noted above) indicates one-off resolution of disputes is inefficient if the real issue is a policy gap. That is, if the jurisdictional dispute is general – and the disputes between INAC and FNIHB certainly appear so – then it is clearly a policy problem. What First Nations need, then, is a way into the policy-making domain; a way to influence internal government organization and policy. An ombudsman or child advocate ought to be able to perform precisely this function.

In Conclusion:

The most effective way of dealing with jurisdictional disputes is to prevent them. For this reason, I strongly believe that a change to current federal funding of First Nations child welfare agencies must include a provision for community assessment. The precedent has already been set by Health Canada due to their reliance on the population health paradigm. There is every reason to suppose a similar approach toward the incidence of child abuse and neglect is equally necessary. As noted, a significant byproduct of community assessments is the creation of networks of cooperation and trust. In turn, this ought to lessen the incidence of jurisdictional disputes.

Cooperation between staff and government departments is not a given. If community assessments begin the process of networking and cooperation then it is standing committees that sustain them. A committee structure presents significant difficulties for agencies in remote areas. Ideally, then, travel budgets of remote and rural agencies must recognize the importance of face-to-face contact amongst agents because it is only in this way the trust necessary for cooperative action can be initiated and sustained. Furthermore, a committee structure with access to its own budget line may provide a mechanism for dealing with disbursement of funds for extraordinary costs. I will pursue this recommendation in the following section.

Despite the best efforts of individuals, jurisdictional disputes are unlikely to be eliminated. They are simply a fact of life in complex bureaucracies. At present, there is no formal mechanism for outside mediation of disputes. Thus, it appears that in some instances disputes multiply due to an increasing mistrust and a belief by one or more parties that their position is neither heard nor understood. A funding mechanism is required to provide mediation services where they are appropriate. Mediation is not without its problems; however it can be a very useful resource under the right circumstances. Certainly, mediation services would be cheaper, less time-consuming, and more efficient than the current situation in which staff time is drained

out of direct service and into dispute engagement. Moreover, one supposes that persistent jurisdictional disputes might eventually lead to expensive and drawn out litigation.

Finally, the lack of an independent voice representing First Nations children's voices suggests the honoring of the Convention on the Rights of the Child is more rhetorical than actual; if INAC staff have the opportunity to call upon an ombudsman, why not children? Ideally, a First Nations child advocate would be entirely independent of government structures through its institution as an Officer of Parliament. In any case, any sort of quasi-independent voice would be better than the current situation.

Again, the logic of an independent advocate is based upon the observation that, at present, many resources supposedly destined for the maintenance of First Nations children are currently being directed towards the resolution of jurisdictional disputes which are all too predictable and repetitive. If, for example, an advocate was able to convince FNIBH and INAC to mesh their policies almost half of all serious jurisdictional disputes would be resolved. That Health Canada and INAC have been able to do this in one province suggests it can be done in all provinces. Of course, for First Nations the frustrating part of this problem is that without an advocate with access to federal government decision-making processes, it cannot be known why the problem persists. An advocate with an investigatory mandate could fulfill this function.

Extraordinary Costs

Six agencies reported incidences of extraordinary costs. Of the agencies reporting no incidences, two were from the same province (Alberta), while the third had a block funding agreement. In the latter case, it may be that the agency did not consider any expense 'extraordinary' insofar as block funding implies funding for everything – including extraordinary costs. Thus, this agency may experience extraordinary costs but does not perceive them as extraordinary because of the nature of their funding arrangement.

Agencies reporting extraordinary costs tend to mirror the concerns expressed with jurisdictional disputes. That is to say, extraordinary costs are associated with isolated and high needs communities due in the main to the travel costs incurred for providing service; costs associated with a lack of specialized care/resources such as psychiatric care for suicide, homicide, substance abuse, and so forth; and costs incurred due to delays caused by jurisdictional disputes.

Agencies servicing remote communities note the high cost of staff travel as well as travel for clients for diagnostic or remedial services. Two agencies noted the high costs of travel associated with calling a staff meeting (up to $50,000), but also the inherent danger of winter travel in sparsely populated districts. This danger is to be understood as twofold; a) danger associated with seasonal weather conditions and b) danger associated with child protection workers (and foster parents) co-resident with dangerous and potentially life-threatening clients in isolated and non-policed communities.

Children with complex health issues are a major feature of agencies' reports because these problems are widespread yet random in occurrence. That said, agencies servicing isolated communities report it is impossible to know the incidence of complex medical needs because travel costs preclude diagnostic services[17]. Related to the problem of complex medical needs are those children with complex developmental disabilities. The average cost of developmental disabilities of the four agencies reporting is $115,000. However, developmental disabilities often require extensive capital investment in accessibility technology but these costs do not appear to be part of agencies' calculations.

Like complex medical and developmental issues, complex mental health needs present extraordinary management challenges. Assuming they have been diagnosed, and there is little reason to believe the incidence of mental health difficulties amongst First Nations children has been adequately surveyed through appropriate diagnostic tools, then the average cost per agency of servicing such children is $500,000. It is unclear from the

data whether this includes special residential arrangements such as Special Needs homes. If it does not, an agency's reporting special needs foster care requires $12,500 per day is in addition to this initial $500,000. On the other hand, both agencies and provincial governments report specialized (and out-of-province) institutional placement as a major budgetary problem. Presumably this is because such institutions are inherently expensive but also because of the difficulty of predicting both the number of children requiring such care and the length of time the children would require intensive institutionalization.

One agency reported as an extraordinary cost the expenses involved with terminating an agency employee. A second agency reported as an extraordinary cost provision of post-majority care provided for by provincial statute.

The employment example is the only example of extraordinary costs if 'extraordinary' is understood to mean random, unforeseen, and unique. The vast majority of costs identified are not extraordinary by local standards. In other words, one agency reports the costs of helicopter transportation; a cost unique amongst surveyed agencies. However, there is nothing extraordinary about this form of transportation in the local area. Hence, what makes this cost extraordinary in the mind of the agency is a lack of adequate transportation funds covered by Directive 20-1[18].

In addition to the problem of medically fragile children and out-of-province institutional care, the Nova Scotia case study mentions "legal and settlement costs" in which "[settlements] can cost hundreds of thousands, while legal costs can be around millions". It is unclear from the response what sorts of settlements or legal procedures are referenced however it seems likely to include historical abuse settlements, class action lawsuits pertaining to institutional care, or serious abuse within other forms of care. This would be consistent with other jurisdictions; For example, British Columbia has been to the Supreme Court of Canada to appeal liability judgments in all these categories. According to the Nova Scotia case study there is no settled formula for dealing with such cases. Instead the government:

> Tend[s] to absorb it centrally after a review of all other alternatives and justification of the expense. Sometimes an agency can handle the cost, especially if their normal case load has dropped. The central office doesn't have a contingency budget for this either – the request needs to go to the Deputy Minister and sometimes to Cabinet. (N.S. case study)

In this description one detects a hierarchy of claims. First, local agencies are expected to cover costs through internal budgetary adjustments. Where this is not possible, the problem rises to provincial ministry which presumably pays for settlements though cost savings in other areas. If the cost is not only extraordinary in terms of type, but also in the amount of monies required then a Deputy Ministerial decision is required, which would presumably involve informing the responsible Minister and possibly making a special request to Treasury Board. Finally, where the cost is very large (millions) then Cabinet becomes involved as the cost may well involve reallocation of government budgetary resources involving other ministries.[19]

It should also be noted that the case study implies extraordinary expenses only involve one-time settlements and litigation. This would be consistent with the general legal practice of calculating "future care costs" as a lump sum transferred to the victim. However, it is possible that costs such as future counseling could be rendered "in kind" rather than as a lump sum settlement. In isolated communities where counseling services are sparse such an arrangement may be the only practical alternative. In any case, this may be a situation where an extraordinary cost is not as simple as a one-time payment consequent to a judicial decision. [20]

Since First Nations agencies are relatively new, legal and settlement costs associated with historical abuse may appear relatively remote. However, it should be kept in mind that, to my knowledge, no child welfare system has eliminated moral hazards from their activities. Unfortunate as it may be, no fostering system can prevent the problem of foster parents abusing children in their care. Moreover, given the progressive expansion

of behaviors considered abusive no child welfare system can be sure that its current practices will always be approved at a later date – although the Supreme Court of Canada has indicated the standard for such determinations depends on the usual practices and state of knowledge at the time of the any infractions (K.L.B.). On the other hand, the U.K. experience of the Cleveland Affair indicates that where child welfare personnel utilize novel technologies to determine the occurrence of abuse considerable legal and political effort can be engaged to both attack and defend child protection decisions.

Furthermore, children-in-care are almost by definition a challenging population. For example, in June of 2005 a child pled guilty to murdering a group home worker at his residential resource in Alberta. According to news reports the worker's parents are planning to sue the Alberta government for $75,000 (Harding 2005, A8). Rare as it may be, children-in-care do commit crimes – sometimes violent crimes – both against those that care for them and members of the public. Under such circumstances, agencies and governments may be liable for the crimes of the children. Many of these liabilities are settled out of court and therefore it is difficult to predict potential settlement costs. However, as an example, in 1987 the British Columbia government negotiated a $40,000 out of court settlement to a woman sexually assaulted by a child in a government psychiatric facility for adolescents (Vancouver Sun 1987, G.8).

Of particular concern for agencies serving isolated communities is the gap between the agencies legal responsibility to protect children and the actual resources available to do the job. One agency describes child protection workers in isolated communities taking children into their own homes but without any local police protection. In a worst case scenario, if the person posing a danger to the child were to enter the worker's home and assault its inhabitants one can imagine a resulting plethora of lawsuits. First, the child(ren) may sue the agency for failing to protect them. Second, employees may sue the agency for failing to ensure their safety 'in the workplace'. Third, others present in the employees' home – whether family, friends, or acquaintances – may sue the agency for any harms they or their family members' experience as a consequence of the agency's enterprise. Of course, not taking the child into custody would also present its own potential liabilities.

Calculating extraordinary costs is, then, not a simple or straightforward matter. For agencies servicing isolated communities or challenging clients, lack of sufficient funding for travel or adequate residential resources may transform ordinary travel costs into extraordinary legal costs. That is to say, the inability to monitor resources for potential moral hazards, travel and diagnostic barriers preventing agencies from fulfilling their statutory mandates, the dangers associated with potentially volatile clients, and reliance on ad hoc travel technologies may save money in the short run but extraordinary expenses in the form of agency liability seem inevitable.

Forms of Extraordinary Costs:

In general, the most significant costs reported by agencies can be divided into three types; a) those that are extraordinary due to jurisdictional disputes or obviously insufficient funding; b) costs associated with the unexpected and random distribution of moral hazards found in any child welfare system; and c) costs experienced by other jurisdictions but not mentioned in the agency survey.

Type (a):

1) Agencies servicing isolated communities face extraordinary staff travel costs, communities with widespread and largely undiagnosed problems associated with community-wide dysfunctions, and an inability to transport clients to needed services. In addition, child and staff safety is compromised due to a lack of adequate police protection and safe forms of transportation. These costs are only extraordinary insofar as they are costs not ordinarily faced by most child welfare agencies. They are not however extraordinary for these particular agencies. Rather, they are simply costs associated with providing child welfare to

isolated and often dysfunctional communities. These problems are not amenable to 'one off' solutions but instead demonstrate an ongoing need for adequate funding if child welfare responsibility is to be practiced in isolated communities. Reported under-funding is difficult to judge since agencies responsible for isolated communities are, in a sense, "bottomless pits" of problems and therefore funding requirements are potentially without end. I suggest that establishing the necessary budgetary commitment can only be calculated in the context of an adequate community capacity assessment. As it stands, funding estimates are at best guesses and at worst wildly divergent from actual needs.

2) Children with complex medical needs create extraordinary costs. It should be kept in mind that this issue is also significant for jurisdictional disputes. These kinds of extraordinary costs may be considerably alleviated if funding and responsibility disputes between FNIHB and INAC are resolved. Put another way, funding for complex medical needs is not necessarily an agency problem; it becomes an agency problem when federal departments dispute responsibility amongst themselves. That said, there remain additional travel costs agencies can expect to absorb. In-person case management and consultation, costs associated with accompanying children to medical services, and family visitation for children unable to live in their home communities are not, strictly speaking, medical costs. Such visitation is, of course, necessary for best practice reasons. Therefore, staff and family travel costs are rightly an agency responsibility. However, they are not, in and of themselves, extraordinary costs insofar as the population of children with complex medical needs is calculable. For that matter, if FNIHB's recommended community needs surveys have been completed then the demand ought to be largely known.

3) From both agency data, and the FNIHB policies available to me, it is difficult to judge the boundary between FNIHB responsibility and agency responsibility for children with complex developmental disabilities. Judging by the information available it seems likely FNIHB would limit its responsibility to direct medical care and provision of prosthetic devices. However, the general movement toward de-institutionalizing the physically and mentally disabled has revealed considerable cost considerations with respect to the provision and/or monitoring of daily care as well as the need to retrofit public buildings, roadways, vehicles, and housing. In the absence of other sources of funding, it seems likely many of these costs will fall to agencies. Again, it is useful to remember these issues are not unique to First Nations except that many First Nations have considerably further to catch up to standards still developing within the non-aboriginal world. Research is clearly required to establish the incidence of children with complex developmental delays resident on reserve. Furthermore, as de-institutionalization becomes entrenched, such a determination will need to take into account both the possibility of disabled persons returning to their home reserves and the difficulty of establishing a baseline when past practice was to remove disabled children from their homes and place them in institutions.

4) As with (3) above, the jurisdictional boundaries and incidence of complex mental health needs are difficult to determine. As mentioned above, addressing mental health issues on reserve is something of a novel initiative since historically it seems to have been ignored. The knowledge vacuum is exacerbated by the lack of diagnostic services available to remote communities. It is worth noting however that where complex mental health needs are mentioned by the survey they are far and away the most expensive needs to service – likely due to the extraordinary supervision and residential requirements associated with mental health needs.

Type (b)

1) The only purely random extraordinary cost reported by agencies concerned costs involved with terminating an employee. The cost was estimated at $25,000.

2) As alluded to in Type (a) (1), widespread community dysfunction is reported by agencies concerned with isolated communities. However, one agency drew attention to "communities in crisis". Examples of such crises include sudden jumps in suicide rates (referred to in suicide literature as "clustering") and periodic outbreaks of substance or solvent abuse. Responding to such crises places an enormous drain on both ordinary travel budgets (already overstretched) and staff time with the usual problems of back-fill this creates. Additionally, such crises and the sudden demands they generate, tend to make great demands on whatever counseling services are available. [21]

Type (c)

1) No agencies reported extraordinary legal costs for liability exposure. However, while this may be a function of First Nations agencies effectiveness, I would suggest it is more likely due to agencies' relative novelty. It is also worth noting that lawsuits directed at government child welfare policies and practices are still in their relative infancy, which suggests jurisprudence in the area is still unsettled. For example, The Critchley judgment of the British Columbia Court of Appeal that established important principles of government liability was rendered in 1998. The next year, the Supreme Court of Canada rendered its decision in Bazely where it was found the Children's Foundation was vicariously liable for the torts of a group home parent. Significantly, the Children's Foundation had no insurance coverage for this type of liability. Had the British Columbia government not underwritten the damages accrued, the Foundation (a non-profit organization) would likely have gone bankrupt.

   Given the potential for large damage quanta, it is unlikely First Nations agencies could afford insurance for global liability – especially since according to H.L.A. Hart (1994, 132) liability can only be determined after-the-fact. Exposure to liability may not constitute the most common form of extraordinary expense experienced by agencies, but in light of the comments of the Nova Scotia official it may turn out to be the most expensive. Clearly, protection from liability exposure, and a means of ensuring damages do not bankrupt First Nations agencies are crucial to the First Nations child welfare project. First Nations agencies do not share the economies of scale enjoyed by government nor do they have the kind of deep pockets self-insurance requires.

2) As with the example from Alberta given above, agency liability is not limited to the actions of its staff or contracted representatives toward clientele. Liability exposure must also take into account agency exposure to liability for the conduct of its clientele toward its staff. Given the safety and policing concerns expressed by agencies responsible for isolated communities this form of liability exposure deserves further attention.

3) Type (b) 2 concerns the effects of periodic crises on service delivery to communities – these are understood as located within the community as a whole rather than crises located within individual behavior. However, communities are also subject, from time to time, to crises consequent to natural disasters. The precise boundary between natural and human causation can be fuzzy with respect to natural disasters (i.e. is a dam bursting, or an oil tanker sinking a natural disaster?). Moreover, disasters can be sudden (i.e. an earthquake) or cumulative over extended periods of time. The Minimata effect at Grassy Narrows and Whitedog reserves is an example of a cumulative health and social disaster.

There are three aspects to disasters that need to be kept in mind. First, disasters need a coordinating body. Second, disasters require immediate response. Third, disaster response is usually followed by a period of reconstruction. In off-reserve Canada, governments have established a number of emergency plans and protocols to clarify what body is responsible for declaring an event a disaster and to ensure coordination and quick response. Whether these plans and protocols are binding on reserve is a legal question, however it seems reasonable to assume that First Nations might choose to develop their own emergency

response either because the community is of a sufficient size to warrant independent plans, the community is sufficiently isolated that it is effectively self-responsible, or the community makes a political decision to take care of its own.

In the case of a disaster in the form of an epidemic, it is now well appreciated from the African AIDS experience that a large number of orphans can be created by age opportunistic diseases. Were such an epidemic to break out on reserve it would be up to agencies to try to cope with the social consequences of a lethal epidemic. Moreover, Canada's experience with SARS suggests that it is not just the objective dangers of a given disease, but subjective risk perceptions that define whether or not an event is classified as a disaster.[22]

The implication of natural disasters is the need for a disaster planning body. The federal government provides for a source of funding for such planning through its Public Safety and Emergency Preparedness program. Of First Nations, the programs website states:

> Under the legislation of Alberta, Prince Edward Island and the Northwest Territories, the band council of an Indian band or a settlement council, as the case may be, is given the same power and responsibility as a local authority with regards to preventing, responding to, and recovering from an emergency. In British Columbia, the Minister of Indian Affairs is the local authority for a reserve. Alberta allows reserves to be considered municipalities under the Disaster Services Act. Manitoba supports First Nations initiatives such as an Assembly of Manitoba Chiefs for emergency preparedness activities and the Manitoba Association of Native Fire Fighters.

The Department of Indian and Northern Affairs is required, under the federal Emergency Preparedness Act, to co-ordinate emergency response measures on all reserves. The INAC works to ensure "contingency plans are in place in First Nation communities on reserve lands and in communities on federal lands north of 60 degrees." It attempts to provide "prompt, coordinated responses…that are community based and supported by the local population." (INAC, Administration Manual, Foreward, 1994.)

It is beyond the purview of the present work to examine this arrangement in detail however it is clear that responsibilities vary from province to province and the likelihood of INAC creating a comprehensive, nation-wide, emergency preparedness plan for all First Nations' reserves is highly unlikely. It seems reasonable then to suppose First Nations governments, child welfare agencies, and health organizations have an interest in establishing their own disaster responses and that INAC should be the conduit for funding that activity. [23]

Finally, the Public Safety and Emergency Preparedness program has a role to play in post-disaster reconstruction. First Nations child welfare agencies need to feel confident the interests of their clients are reflected within any reconstruction effort. This may be accomplished through on-reserve consortiums of interests (government, child welfare, health, education, etc.) and, in the case of children, underwritten by the either the committee system and/or the children's ombudsman/advocate as proposed in the jurisdictional disputes section of this paper.

4) No agency specifically reported involvement with public inquiries as an extraordinary cost. However, as discussed in the introductory section of this paper, public inquiries into child welfare are the quintessential extraordinary cost. This is so because a) such inquiries are impossible to predict when so often they are a consequence of press interest and transient political pressures; and b) because the kinds of events leading to public inquiries are usually not, in themselves, extraordinary. Rather, attention is attracted to such events due to their unusual and unforeseen consequences. This is particularly true for child homicides where the belief that a child died as a consequence of child abuse, and that the consequence of that child abuse was obvious, is widespread but erroneous.[24]

I will not belabor the obvious problems inquiries

present with respect to drains on staff time, the need for back-fill of positions, impact on staff morale, requirements for travel and the problem of attending inquiries of uncertain duration. I will simply reiterate that I have discovered no budget line specifically set aside as a contingency fund for such activities. Rather, governments tend to absorb these costs through economies of scale, specific requests to cabinet and Treasury Board, or through an entirely separate inquiry budget. Clearly, Directive 20-1 did not anticipate the possibility of extensive resource commitment to such inquiries despite the fact First Nations have no control over their establishment or the degree of participation required of First Nations.

Budget Strategies:

Funding provision under Directive 20-1 is primarily divided into two forms; operational costs and maintenance costs for children in care. Operational costs are adjusted according to on reserve child populations and degree of remoteness. So far as I've been able to ascertain, if there was an initial logic to the division of funding and the amount of funding, that logic has been lost over the intervening years. As a general observation, it seems clear that agencies' subsequent experience has demonstrated Directive 20-1 severely underestimated both the types of agency activities and the funding required for supporting those activities. Hence, a theme of agencies surveyed is the universal practice of 'robbing Peter to pay Paul'. In particular, a general problem is the diversion of maintenance funding away from children in care and towards subsidizing large travel or administrative costs.

This paper has argued that a good deal of what is considered under the general rubric of jurisdictional disputes and extraordinary costs is, in fact, neither. Rather, for approximately half the cases, jurisdictional disputes and extraordinary costs are actually problems associated with under-funding. More precisely, lack of funding for the particular circumstances of particular agencies. The theme to which this paper has consistently returned – the need for the kind of community assessment already entrenched in FNIHB policy – attempts to suggest that funding quantum needs to be tailored to each agency's particular circumstances.

Operational funding:

Operational costs are clearly inadequate to cover travel expenses conceived as 'extraordinary' from a national perspective but 'ordinary' from the perspective of agencies faced with delivering statutory services to remote locations. As well, a national funding formula cannot take account of the differing operational costs associated with provincial legislative and policy demands. These demands range from the purely bureaucratic (i.e. audit and reporting policies) resulting from administrative requirements built into contracting arrangements required by provincial governments, to legal responsibilities pursuant to the delegation process. For example, responsibility for mediation, repatriation and post-majority services varies with each province's legislative regime. Hence, one operational formula cannot be sensitive to each of these varied demands.

With respect to contracting, it is significant that one agency reporting no jurisdictional disputes mentions disputes between FNIHB and INAC over medical funding; but not as a problem for the agency. This is due to the contractual relationship the agency has with the federal government. By inference, if this contractual relationship were replicated across the country a significant number of jurisdictional disputes would be eliminated. Of course, it would be simpler if the two branches of the federal government could resolve this problem in Ottawa, but a clause within agency contracts could protect agencies from the periodic reallocation of funding responsibilities between federal departments.

Travel costs ought not to be limited simply to the costs associated with adequate transportation technologies. As noted above, transportation problems have significant knock-on effects for both the safety of children and staff. Thus, savings realized from inadequate travel budgets may well reappear as extraordinary costs in the form of legal liability.

Assuming the distinction presently made by Directive 20-1 between operational and maintenance funding remains in place, the most crucial improvement needed for operational funding is the inclusion of a requirement and funding support for community capacity assessments. As discussed above, this is a requirement for health funding and it seems curious child welfare has not hitherto been subject to a similar requirement. Much of the difficulties coded as jurisdictional disputes and extraordinary funding could be alleviated with this relatively inexpensive investment.

In addition, increased funding for travel is required, particularly where this is directed at agencies responsible for remote communities. Similarly, the formula for operational funding must reflect the actual demands placed on agencies by various provincial legislative requirements. Hence, the formula probably needs to be tweaked by provincial jurisdiction. Further, given that agencies have no control over shifts in provincial legislative and policy regimes, the operational funding formula will require regularly scheduled reviews (say, every 3 to 5 years) of changes in provincial requirements.

Maintenance funding:

In one form or another, all surveyed agencies report a significant proportion of children in care, or children likely to enter care, as possessing significant special needs. The actual demand is unknown largely due to the difficulty of accessing appropriate diagnostic resources. Again, this problem grows more acute the more remote the community served. While an adequate community assessment would help to reveal the extent of the problem for any particular community, the problem of diagnostic, treatment, and supervision costs remains to be calculated. As noted above, by far the most expensive type of client are those with complex mental health concerns, however costs associated with complex developmental delay and complex acute medical needs are equally urgent.

By and large, provincial jurisdictions solve the problem of varied special needs by creating graduated care regimes. That is to say, the cost of maintaining a child in care varies according to the degree of care the child requires. This approach would seem to be self-evident; however the approach seems to have no application within Directive 20-1. Of course, recognition of the principle of special needs does not necessarily imply agreement upon where the boundary between 'special' and 'regular' lies, nor how much funding should be attached to 'special care'. Some argue all children in care have special needs, but this seems unhelpful given the broad range of potential disabilities, their relative severity, and variable access to support services.

As well, while special needs children require attentive and professional care, their needs are also understood to include specialized support (i.e. psychiatry, counseling, etc. with their associated travel requirements) and capital costs associated with renovating modest housing to accommodate children with special needs (i.e. wheelchair ramps, accessible vehicles, additional staff associated with twenty-four hour care of the medically fragile, etc.)

From the perspective of the federal government, the difficulty with recognizing children's special needs is that, at present, it is almost impossible to predict the global costs associated with a graduated maintenance regime. Largely, this is because there is, as yet, no reliable mechanism to calculate the actual incidence of children with special needs on reserve. The best source of such information may be FNIHB but it seems likely to be incomplete. Nevertheless, a survey of community needs assessments undertaken under the auspices of FNIHB policy may give a rough approximation of the number of children with complex special needs.

It is further worth noting that special institutional care is noted as a large expense by the Nova Scotia case study. All child welfare jurisdictions are faced with such costs and recognize they are sufficiently beyond the means of the usual formula for maintenance that they are often paid out of centralized budgets. Here, provincial authorities rely on their economies of scale to absorb extra costs which are extraordinary in the sense of being outside the usual requirements of residential care but ordinary

in the sense of being regular and predictable in their incidence. It seems likely, then, that a central budget – either managed by INAC itself or managed by the committee system proposed above – will be a requisite to ensure adequate funding on an as-needed basis.

The funding formula for maintenance must be adjusted to create a tiered system of payments capable of recognizing the real incidence of complex special needs amongst on reserve children in care. The hierarchy must not be limited solely to residential costs but must be inclusive of the purchase of necessary professional support. The system needs to be augmented by a central budget line capable of releasing funds on an as-needed basis for institutional care or unexpected demands for exceptional costs.

Directive 20-1 seems not to have contemplated the need for capital costs associated with accessibility and the disabled. These costs are of two types; housing and vehicle renovation targeted at particular children and community based renovation such as installation of sidewalks, access to public buildings, traffic control, and the like. I raise this issue of public accessibility here because there seems little point in ensuring disabled children in care are located in accessible housing if they are unable to leave the residence due to lack of public amenities.

Funding External to Directive 20-1

Within the limitations of Directive 20-1 significant improvements can be made with a more nuanced and expansive use of the categories of operational and maintenance costs. However, the problem of extraordinary costs – that is, costs which come, as it were, 'out of the blue' remains. Similarly, the drain on agency resources caused by jurisdictional disputes which are often replicated across the country needs to be addressed through alternative funding structures. What follows, then, constitutes something of a wish list for a comprehensive on reserve child welfare system.

As noted above, at present First Nations children are the only children without a designated independent officer responsible for representing their interests. I regard it as crucial such an officer be appointed under the title of advocate or ombudsman. This officer would be a federal functionary (but ideally appointed through a consensus of the Assembly of First Nations or its designate, and Parliament) but independent of government and particularly INAC. Attached to this office may be either in-house mediators or a budget line for engaging mediators on an as-needed basis for jurisdictional disputes. As noted above, the frequency of jurisdictional disputes, and the costs associated with those disputes, varies wildly between agencies. Hence, it seems reasonable to centralize this aspect of advocacy work so that it is available to those jurisdictions where it is most needed as opposed to including small amounts of funding for each agency.

A similar economy of scale applies to the proposal for multi-jurisdictional committees. A separate budget line is required both to ensure adequate travel funds for their membership but also to allow for committee control of a budget line designated to address extraordinary costs as they arise[25]. Funds controlled by these committees would constitute a kind of insurance against extraordinary costs (such as inquiry participation or sudden community crises) requiring deeper pockets than any single agency could afford. They may also be able to coordinate back-fill for sudden events resulting from sudden drains on agency personnel resources. It is possible the committee controlled budget line could be established through a surcharge on funding for each agency (which would make it an insurance function), or funds could be disbursed from INAC to provincial committees which, in turn, would disburse a portion of those funds to regional and local committees. In any case, it is clear that no child welfare jurisdiction is immune to unexpected costs sometimes counted "in the millions". What is needed is a replication of the economies of scale the federal and provincial governments are able to call on.

Also outside the purview of Directive 20-1 are funds necessary to address the possibility of natural disasters and capital costs associated with community accessibility for the disabled.

As alluded to above, it is probable these costs are not likely to be seen as child welfare costs per se. However, an advantage of a children's advocate or ombudsman would be the ability to put these issues 'on the table' as children's issues. Whether agencies become the lead agencies responsible for addressing these shortcomings is, I suspect, for individual First Nations to determine. However, disaster response and accessibility is not the exclusive domain of the adult world. Therefore, funding for operational costs must reflect demands on agency resources for addressing these issues. Again, this may be incorporated directly into operational costs, or constitute a surcharge on contracted funding. In either case, recognition of children as full citizens also means recognition within all policies that affect them.

Footnotes

[1] See (HRDSC n.d.) for a list by province of risk assessments in use in Canada.

[2] But see O'Sullivan and McHardy (2004) for a

national measurement using a Community Well-Being Index. The analysis provided gives regional comparisons, but not comparisons by type of community.

[3] And, of course, this self-categorization has implications for self-esteem and all the possible social problems low self-esteem is associated with.

[4] I have written on this elsewhere. See Cradock (2003) for a fuller account. In the U.K. similar inquiries have been sparked largely due to press coverage (see Nava 1995 for a media analysis of the Cleveland Affair and Franklin and Parton (1991) for a more general account of the relationship between social work and the press).

[5] British Columbia established the Children's Commission to conduct such inquiries in the wake of the Gove Inquiry. The Commission was disbanded in 2001 with the election of a new government.

[6] This number cannot be explained solely by the size of population served. Similar populations served by other agencies do not produce anywhere close to this number of disputes. It is possible the data was skewed insofar as the survey describes disputes between two parties. Perhaps this particular agency is double reporting tripartite disputes and therefore the survey double counts. Even so, the minimum number of disputes would still be on the order of 80, significantly higher than any other agency.

[7] See below for the construction of the 'non-disputing' self in the context of mediation. As an aside, variations between numbers of disputes may also indicate cultural differences towards disputes across First Nations in general. Further, see Cruise (1986) for rumination on contemporary aboriginal socialization and its relation to assertiveness. Briefly, Cruise argues part of aboriginal subjectivity depends upon creating an oppositional stance toward dominant social values. Lemert (1954) made a similar observation about 'outlaw' social groups within the nascent Catholic Indian State of late 19th century British Columbia.

[8] The Province of British Columbia has also experimented with specialist First Nations negotiators. When B.C. had a Ministry of Aboriginal Affairs it was supposed to liaise with designated persons within all other ministries within government to ensure First Nations issues were incorporated into all government initiatives. The Ministry was disbanded in 2001 and has recently (June) been resuscitated. The B.C. experience is a reminder that the priority given to negotiations between First Nations and other governments can radically change and therefore is always, to some extent, at the pleasure of sitting governments.

[9] Poorly planned social initiatives are not limited to aboriginal issues. See the withering critique of the Ombudsman of Ontario (2004) with respect to insufficient research, poor administrative planning, lack of funding and the consequent inflation of public expectations created by the Ontario government's attempt to establish services for autistic children.

[10] For example, previous research has identified aboriginal children entering care because of medical needs which parents cannot afford to meet. The recent scandal in Ontario over just this issue demonstrates this not unique to aboriginal children. (Windsor-Essex C.A.S. personal communication; Ombudsman of Ontario 2005)

[11] What I have in mind here is drawn from my own experience servicing remote communities in British Columbia. For example, to contact one band meant radio-telephoning (through an exchange) a luxury fishing camp who would then have an employee get into a boat, round the point to the band's location, and bring back a band member to the telephone. Needless to say, any telephone conversation was a very public communication. Similarly, in that area, cel phones were useless because there were no relay stations. It is possible face-to-face meetings might be replaced with new video conferencing and satellite communication (which might also have the benefit of being relatively independent of prevailing weather conditions) but if this medium is preferred it will obviously have capital cost implications.

[12] This model is loosely based upon the old Inter-

Ministerial Children's Committees (IMCC) utilized in British Columbia during the 1980s. These committees ranged from local committees of what amounted to interested persons, through regional committees, and up to a committee composed of Deputy Ministers.

[13] I have in mind here unexpected consequences for First Nations of policy changes directed at more global issues. As in the above example from Ontario re: special needs children in care. Of course, it is possible agencies may change their own policies and spark a dispute with provincial and federal agencies.

[14] Since the report was issued, British Columbia has abolished its Child and Youth Advocate.

[15] At the time, British Columbia had no independent body designated to advocate on behalf of children. However, these reports were authored by a deputy ombudsman who fulfilled that role within the larger mandate of the Ombudsman.

[16] The Act seems to have died on the order paper at least three times. In any case, it has never got past first reading.

[17] Presumably, many undiagnosed complex medical needs would eventually be counted as child mortality.

[18] Unusual forms of transportation (i.e. snowmobiles and other local forms of transportation from pick-ups to herring skiffs) are not solely used by protection workers but also by children if removal from isolated communities is the only way to ensure children's safety. If, as one agency reported, "no normal person would do it" then one might speculate that transportation risks are perceived as 'ordinary' if undertaken by workers but 'extraordinary' if undertaken by children. One can imagine a child taken into care to protect their safety but subsequently drowning if the snowmobile transporting them falls through the ice. The cause of death would, no doubt, be extraordinary while still not unexpected. The cost of dealing with the liability issues would however be both unusual and extraordinary.

[19] I have examined the line budgets of several provinces and INAC. I have not been able to identify any targeted contingency budget addressing such extraordinary costs.

[20] Historical institutional abuse arbitrated through an ADR process is another such situation. In this case, economies of scale and expertise might suggest a dedicated budget line for counseling services directed at a class of persons over a period of years; perhaps decades.

[21] My own experience as a child protection worker provides an example. An on-reserve school introduced the C.A.R.E kit for sexual abuse prevention. For a number of weeks nothing happened and then on a Friday afternoon my office received 17 allegations of sexual abuse all requiring immediate investigation. Of a total staff of six social workers, two were pulled off their usual duties to deal with the crisis. These workers' usual duties were taken on by auxiliary staff brought in for the occasion. However, costs were not limited to investigations. Prior to the introduction of the kit, and in the certain knowledge it would generate numerous investigations, the Province of British Columbia provided funding for the training and employing of four support workers. Even then, a professional counselor was also provided through Victims Compensation funding for personal counseling of the children. It is difficult to estimate the total cost because of the varied budget lines concerned. Suffice to say, dealing with that crisis was not cheap.

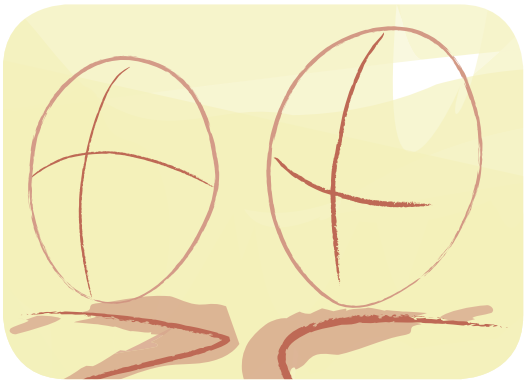
[22] Risk assessment theorists are well aware of the role of subjectivity. A favorite example is the varying perceptions of the dangers of nuclear power. Subjectively, nuclear power becomes more dangerous the closer one lives to a nuclear power plant.

[23] The preparedness program is comprehensive in its scope. It includes, for instance, privately owned dams, computing failure, storage of important documents, and anti-terrorism responses. A First Nations presence within the program may add issues of particular interest to First Nations to the program's rather eclectic list of concerns.

[24] I have written on this subject before so I will not belabor the subject here. See Cradock (2003; 2004) for a more detailed account.

[25] This is not to imply that the federal government would also be responsible for the participation of provincial representative, or that these provincial representatives would 'control' the disbursal of funds. What I have in mind is more the possibility of the committees accessing funds that could be used for such arrangements as matched funding or the purchase of, for example, institutional care in provincial resources.

Small Agencies



CHAPTER 7

Prepared on behalf of:
First Nations Child & Family Caring Society Canada

Prepared by:
Valerie Lannon & Associates Inc.

May 10, 2005

Introduction

1.0 - Background

The First Nations Child and Family Caring Society of Canada (FNCFCS) has been engaged to work with the National Advisory Committee (on the National Policy Review) to provide research which can be used to develop alternative funding formulae for First Nations child and family service agencies.

A multidisciplinary team is using a number of approaches to accomplish this research task, and part of the project entails a review of small agencies, those who serve child populations of less than 1,000. There are 51 small agencies out of a total of 93 agencies in Canada, excluding Ontario. (source: Summary report by FNCFCS presented February 2005 to a meeting of the Operational Funding Formula Design Team, Vancouver BC)

The three areas of inquiry are:

- What are the core administrative staffing and related requirements of small agencies?
- How should the funding formula be adjusted to meet these requirements?
- What is the minimum size of agency and related population that is consistent with good social work practice and economies of scale?

1.1 - Methodology

The FNCFCS engaged the services of Valerie Lannon & Associates Inc. to complete the research and prepare a report on small agencies. Ms. Lannon completed the research on agencies in British Columbia, and Ms. Judy Levi, an agency director in New Brunswick, completed the research on agencies in that province.

A structured interview was conducted with fourteen agency directors either on site or by telephone, using the questionnaire included as Appendix A.

1.2 - Agency information

The description of these fourteen agencies by child population is as follows:

Region	Less than 250*	Less than 500	Less than 800
B.C.	0	5	2
New Brunswick	4	3	0

** Note: these New Brunswick agencies came into existence prior to the establishment of Directive 20-1.*

The only other region with a significant number of small agencies is Quebec (12 out of 15 agencies); however, due to resource limitations, the Quebec agencies were not included in this aspect of the research project.

1.3 - Range of services provided

In addition to child protection services (by fully delegated agencies), the fourteen small agencies who took part in this research project also provide the following services:

Type of service	
Family preservation (child out of care)	11
Child support services (child out of care)	13
Respite care	11
Family reunification (child in care)	12
Support services for temporary or voluntary care	12
Adoption services	6 (in NB only)
Reunification (adults)	4
Prevention services	13
Community development	9
Foster home services	13

Other services provided by individual agencies included:

- Head Start
- Pilot Program For Youth At Risk
- Counselling
- Supervised Visits
- Recreation
- Early Childhood Development
- "Healthy Food" Programs
- Youth Advocacy
- Family Relations Act Advocacy
- Family Resource Centre
- Court Counselling And Intervention.

1.4 - Additional services required

When asked to identify services the agencies would like to provide but are unable to do so because of the limits of current funding, the respondents named the following services (costs noted where provided by respondents):

- Family Enhancement (In-home Parenting)
- Youth Enhancement
- Family Nights
- More Family Support Services
- Support For Two-spirited Youth
- Child And Youth Care - $80,000
- In-service Training - $50,000
- Foster Parent Facilitation $30,000
- Youth Activities (Share Costs With Other Service Providers)
- Services Off-reserve
- Family Counselling
- Services For Children With Special Needs
- On-call Services
- Adoption (Bc)
- Courtworker - $50,000
- Family Treatment Centre - $120,000
- Early Childhood Intervention - $60,000
- Mentors, Youth Summer Camp, Social Worker In Schools, Family Support - $205,000.

Characteristics of Small Agencies – some Regional Differences

2.0 - Regional differences

While agencies in both BC and New Brunswick are funded through Directive 20-1, and offer a somewhat comparable range of services, there are differences between the agencies in these two regions. There were also some regional differences in the responses to the questionnaire.

Delegation

BC is the only region in Canada where agencies assume delegated authority in a three-stage process, namely:

- Voluntary services – voluntary care agreements, special needs agreements, approval and support of residential resources, plus prevention and community development
- Guardianship – legal guardianship of children in care on temporary or continuing basis
- Child protection (or "full" delegation) – receipt and assessment of reports of child abuse and neglect, investigations, decisions regarding safety of child and, if necessary, removal of child.

Typically, it takes an agency 5-6 years to reach full delegation.

The composition of the agencies in BC is as follows:

	Voluntary Services	Guardian-ship	Full Delegation
Total # agencies*	2	10	7
# research partici-pants**	1	2	3

*Note: There are two additional agencies in BC; however they do not receive their funding through 20-1. These include the Nisga'a, which is funded under its treaty, and the Spallumcheen Band funded separately and created through a by-law, pre-dating Directive 20-1.

** Note: One of the research participants is an agency in the Start-up stage, not yet delivering delegated services.

Child population size

The Atlantic region is unique in Canada for having agencies whose child population count is less than the 250 required under 20-1. This is because all the agencies in New Brunswick existed prior to 20-1, except one, which received an exemption on size.

Treaties

BC is largely unceded land, and most First Nations in BC are involved in treaty discussions with the federal and provincial governments. These First Nations consider delegation enabling agreements as a preliminary, government-to-government step, prior to the execution of a treaty.

Agency age

Two of the Atlantic Region's thirteen agencies began operating after Directive 20-1 was established, whereas only one of BC's eighteen agencies began operating prior to 1989.

Almost all of the Atlantic Region's agencies began operating in the 1983-85 period and are, therefore, over twenty years old. In BC, most agencies have been in operation for twelve years or less.

Agency surplus

The BC Region of INAC has arranged for BC agencies to receive maintenance payments on a per diem basis, as opposed to payment based on actual expenditures. This arrangement is unique in Canada and provides a sort of "mini-block funding" to agencies.

The current per diem rate is $52.44. It was developed through bilateral negotiations with the provincial government, excluding First Nations. The figure is meant to reflect the average rate of payments for all family-type residential resources, from "restricted" (extended family member) to "level three" homes for children with special needs.

This arrangement can and does result in agencies accruing savings, as long as their actual care costs are less than the per diem rates. Such savings are used for other child and family service program costs.

Regional size and population diversity

BC is much larger in size than New Brunswick. BC has 199 First Nations communities made up of 30-40 major ethnic groups (shared territory, language and culture) and at least eight language families. New Brunswick has far fewer differences among its First Nations groupings.

Key differences in findings:

Respondents from New Brunswick were more likely than their BC counterparts to:

- want to have maintenance payments based on actual costs, rather than on a per diem basis;
- be open to centralizing some functions of their operations;
- identify a need for increased capital expenditures for office buildings and for information technology (hardware and software).

Core Requirements of Small Agencies

3.0 - Introduction

The first area of inquiry for this report is:

What are the core administrative staffing and related requirements of small agencies?

To explore the issues related to this question, agencies were asked to describe, among other

things:

- Current staffing levels
- Current costs for salaries and benefits
- Ideal staffing compliment
- Comparability with other child welfare organizations
- Types and amounts of non-staffing costs, and current funding gaps.

3.1 - Current Staffing Levels, Costs, And Comparability

All respondents indicated that current staffing levels include:

- A full-time program director (in three cases, this position is combined with a social work position)
- Social workers, full-time, varying in number from one to six (presumably depending on funding availability), with the average number being 2.5
- Administrative staff, varying in number from one (the most common number) to five full-time positions.

Annual costs for salaries and benefits range from a low of $64,000 to a high of $608,638. The average agency cost is approximately $250,000.00.

Nine of the twelve agencies that responded to this question indicated that their salary and benefit levels are not comparable to other child welfare organizations. It would take approximately $10,000 - $15,000 more per position annually to be more competitive.

To provide the full range of services needed by the community, virtually all respondents indicated that they would need additional full time staff. Typically this involved one to two more social workers, for an additional cost of up to $170,000 per year per agency. The other most commonly identified need was for prevention workers, at an average annual cost of $35,000 per agency.

Other required staffing, identified by individual respondents, included:

- Early home visitor (new mothers) – requiring a diploma, at a cost of $40,000
- Reconnection worker – requiring a diploma, at a cost of $40,000
- Policy analysts – requiring a BSW, for a total cost for two FTEs $140,000
- Child and youth counsellor/general counsellor – average cost of $78,000.

One agency stated it would need a home economist, a psychologist, an additional social worker, and a courtworker, for a total cost of $340,000 annually.

In an earlier report prepared by the New Brunswick agencies, it was noted that additional funding is needed to ensure adequate levels of training for staff. No dollar amount was specified.

3.2 - Non-staffing costs

The most frequently cited non-staffing cost that would be incurred if agencies were providing their preferred range of services is that associated with capital costs, for either a new office building or space, or office renovations. Estimated funding requirements were in the range of $15,000 to $250,000, with an average of $102,500.00.

In New Brunswick, there was an equal priority placed on costs for information technology software and hardware, at an average cost per agency of approximately $45,000.00

The gap between what is required to run an agency with the preferred full range of services and what the agencies currently receive runs from $119,000 to $524,000, with an average differential of $320,000.

Funding Formula Adjustments

4.0 - Introduction

The second area of inquiry for the research into small agencies was:

How should the funding formula be adjusted to meet these requirements?

Agencies were asked to discuss:

- aspects of the Directive 20-1
- the use of surplus funds

· preference for various forms of maintenance funding.

1.1 - Directive 20-1

While some agencies were satisfied with the separation of 20-1 funding between operational and maintenance funding (because it clarified accounting), there were no agencies that believe the population threshold policy is effective.

The overwhelming sentiment is that these thresholds do not meet the core needs of small agencies, and that funding should be based on community needs, not population size. A couple of New Brunswick respondents added that the entire community population should be taken into account, not just that of children, since it is the entire family that needs support when a child is at risk or is unsafe.

4.2 - Surplus funds

Not surprisingly, it was only BC agencies that advised that they had surpluses and, in almost all cases, the surplus came from the maintenance per diem arrangement.

The policy for use of surplus funds varied by region. In New Brunswick, the agencies noted that the policy is to return any unspent funds to INAC. In BC, however, agencies are to use surplus funds on child and family services.

4.3 - Maintenance funding alternatives

As mentioned in Chapter Two, the BC region is unique for using a per diem arrangement to pay for maintenance costs. In New Brunswick, as in the rest of Canada, maintenance costs are paid by INAC based on actual costs. The agencies were asked which of the two funding arrangements they preferred.

All of the New Brunswick agencies indicated a preference for the current payments, based on actuals. Most feared that a per diem arrangement might result in either a budget deficit or in reduced service delivery.

While two BC agencies stated that payment based on actual expenses would have the advantage of better covering the costs of children with special needs, most BC agencies feared that removing the per diem arrangement, and the removal of associated surpluses would mean less funds for staff and prevention programs.

There appears to be a trade-off, therefore, between being able to fully fund children with special needs, and having discretionary (surplus) funds for prevention and other programs.

How Small Agencies Can Ensure Good Practice and Economies of Scale

5.0 - Introduction

The third area of inquiry for this research was:
What is the minimum size of agency and related population that is consistent with good social work practice and economies of scale?

Agencies were asked about:

- The particular challenges faced by small agencies in delivering services
- The volume of cases required for social workers to maintain their skills
- The allied services needed to optimize the impact of agencies' services
- Measures to achieve economies of scale
- Centralization of functions.

5.1 - Challenges facing small agencies

One of the challenges facing small agencies is the pressure to deliver comparable services to larger agencies, whether these larger agencies are First Nations or the provincial government child welfare organizations.

When asked how they thought their agencies' costs for services compared to what the provinces' costs would be for providing services in the community, the agencies were unanimous that agencies' services were more extensive and, therefore, INAC "gets more bang for the buck" from First Nations agencies. Respondents pointed out that provincial government organizations tend to focus primarily on child protection cases, whereas First Nations agencies, even small ones, provide prevention and community development programs, which act to reduce the incidence of child abuse over time.

In a sense, the question tended to combine "apples and oranges" given the differences in approaches to service delivery between provincial organizations and those of First Nations. The provinces tend to use a tertiary prevention vs. a primary prevention approach, to use the parlance of health promotion.

Some agency directors also pointed out that their costs are lower because they have lower maintenance costs (at least in BC) for foster parents, as agencies are less inclined to place children in more expensive "levelled" homes. As well, agencies are non-unionized and, therefore, are not bound to pay the higher salaries and benefits contained in collective agreements.

Virtually all respondents agreed that their staff members perform duties that would not be expected by employees in similar positions in large First Nations agencies. Examples of some of these duties include:

- community work, such as community clean-up, Christmas and children's parties, helping to furnish houses
- administrative duties
- handling non-child and family service requests (e.g. for transportation to town), mainly as a way of building up trust so that people are encouraged to use the child and family services on a voluntary basis.

In order to support the staff who are faced with carrying out extra duties, agencies have devised a number of methods, including:

- peer support
- support from the Board of Directors
- training on stress management
- use of traditional teachings.

In one case, staff members are given time off to compensate for overtime incurred due to performing "over and above" normal job requirements.

There is little in the way of support, however, when it comes to covering for staff when there are temporary absences, due to illness, vacation, training or other leave, vacations, or staff turnover. The most common response was "someone picks it (the workload) up". But in almost half the cases, directors said the routine, non-emergency work is left undone until the person gets back or the position is filled. In one case, the agency supervisor fills in, and in another case, the agency occasionally will hire a temporary worker. While there are no financial costs associated with these arrangements (because there is no funding available), the human cost can be high in terms of burn-out. The cost of temporary workers runs around $36,000 per year for the agency that uses this approach.

When asked how clinical supervision was carried out where social workers work outside the central office, the vast majority of agencies indicated this does not apply to their situation because all staff work from the same location. In one case, however, the agency responded that the supervisor visits the satellite office, and is also available by phone.

5.2 - Minimum volume of cases

The respondents were asked what volume of cases is necessary to ensure that a social worker's skills do not decrease due to lack of use. Two respondents were unsure, and two others stated that there is no minimum size, as there is always work to be done, and social workers are continually improving their skills depending on the situations they face.

Most respondents, however, believe that a minimum caseload is indeed necessary to maintain skill levels. Opinions varied as to size of the minimum caseload, as follows:

- A range of 10-15 cases for a generalized caseload
- 12-15 child protection cases
- 14 child protection cases and 6 children in care.

Another director stated that the minimum would be five to six cases a year involving a child at risk.

5.3 - Necessary allied services

When asked to identify the allied community services needed to optimize the impact of the agency's services, the majority of respondents named:

- addictions counselling;
- counselling (general);

- housing; and
- health services.

Some agencies also listed: educational supports; recreation; psychological assessment; social development/income assistance; native policing; occupational therapy/speech therapy/ physiotherapy; and employment advice and support.

In addition, the following services were identified by individual respondents:

- parental assessment
- art therapy
- Head Start
- safe house for women
- day care
- family resource centre for women
- cultural strengthening programs
- courtworker program
- transportation.

5.4 - Economies of scale

When asked whether they thought there is a minimum size of agency, and minimum size of population needed to ensure good social work and economies of scale, none of the respondents stated that there should be a minimum size of population. This is because of the high level of needs in their communities. Most respondents would not venture a minimum size of staff; however the two that did suggested a minimum of two social workers to ensure safety, back-up, and the opportunity for consultation and de-briefing.

Most respondents have taken measures to achieve some economies of scale, usually through sharing resources with other programs. Examples include:

- Sharing administrative staff, financial management, building space, and office supplies with another program (e.g. a health program)
- Shared training with other programs
- Joint organization of community events
- Sharing costs to bring specialists to the community
- Using multidisciplinary committees to assess families.

Because of the challenges small agencies face in trying to deliver a full range of services, there has been a suggestion that some agency functions be centralized, for example after hours services, clinical supervision, and administration. All of the New Brunswick agencies favoured this approach, as did the majority of BC respondents. Three BC respondents rejected this approach, however, due to the geographic isolation and/or high travel costs associated with their communities.

Conclusions

6.0 - Introduction

To conclude the investigation into small agencies, respondents were asked to:

- suggest alternative ways of funding small agencies;
- identify whether these alternatives would mean revising or rejecting the Directive 20-1; and
- provide advice to small First Nations to ensure the successful delivery of child and family services.

6.1 - Alternative funding approaches and implications for 20-1

Almost half of the respondents stated that funding should be based on community needs, not child population counts. Another quarter of the respondents (all from New Brunswick) stated that the population count should be of the total population, not just children, since it is the entire family that needs support when a child is at risk or is unsafe with her or his family.

And another quarter of the respondents indicated that a funding formula should include at least one of the following:

- funding for prevention and out of care options
- an increased rate for remoteness
- a mechanism for block funding
- consideration of the total population, whether status or non-status.

Most respondents believe that an entirely new funding formula is required, one that is based on community needs. But two of the respondents believe that adjusting Directive 20-1, by adding funds for prevention and community development, would meet their needs.

6.2 - Advice to small First Nations

All of the respondents encourage small First Nations to think positively about providing child and family services to their members. The most common messages of advice include:

- ensure funding is available for prevention services and make those the priority
- hire good staff
- set priorities
- network and share resources with other programs
- promote community involvement in service planning and reinforce the idea that the whole community is responsible for the well-being of children.

A couple of directors also advised that small First Nations consider the use of block funding although it was acknowledged that small agencies may not benefit from the economies of scale that make block funding work well.

And on an interesting philosophical note, one agency director advised, "What seems inconsequential can have huge implications. For example, just driving someone somewhere helps build trust and can mean there is a greater use of your organization's services." The message here is that agencies should have the goal of being the place that families want to come to when they need help.

APPENDIX A
QUESTIONNAIRE

A. General Background Information

A1 What is the size of the 0-18 status Indian child population served by your agency?

A2 What is the size of the non-status Indian population living on reserve?

A3 Does your agency serve non-status Indian children?
[ ] yes
[ ] no

A4 If so, how many per year?

A5 What are your arrangements for reimbursement?

A6 What is the size of the status Indian children from other First Nations living on reserve?

A7 Does your agency serve these children?

A8 If so, how many per year?

A9 What are your arrangements for reimbursement?

A10 Does your agency serve status Indian children off reserve for whom you receive no reimbursement from the Province or Federal Government (i.e. non-billable children in care?)
[ ] yes
[ ] no

A11 If so, how many?

A12 What is the average cost to your agency on an annual basis?

A13 Does your agency serve non-native children?
[ ] yes
[ ] no

A14 If so, how many?

A15 What are your arrangements for reimbursement?

A16 How many communities does your agency serve?

A17 Are there any that are not accessible by roads year-round?
[ ] yes
[ ] no

A18 If so, are the funds provided under the remoteness factor in the current formula adequate to cover the extra costs associated with remoteness?
[ ] yes
[ ] no

A19 If not, why not?

A20 What is the geographic area you serve?

A21 Do you have

[ ] full; or

[ ] partial delegation?

A22 If partial, which level?

A23 What is the governance structure of your agency?

A24 How many children are typically in care at one time?

A25 What percentage of Aboriginal children in care are placed with Aboriginal caregivers?

A26 How does this compare with when the province was providing services (pre-delegation)

A27 What services does your agency provide among the following:

[ ] Family Preservation (Child Out Of Care)

[ ] Child Support Services (Child Out Of Care)

[ ] Respite Care

[ ] Family Reunification (Child In Care)

[ ] Support Services For Temporary Or Voluntary Care

[ ] Adoption Services

[ ] Reunification Services (Adults)

[ ] Prevention Services

[ ] Community Development

[ ] Foster Home Services

[ ] Other (Specify)

A28 What services would your agency like to provide but is unable to fund under the current funding arrangement, and what are the costs of each service identified?

A29 What do you think the impacts, if any, would be on children and families if preferred range of services could be provided?
Over one year?
A30 Over three years?
A31 Over five years?
A32 Over ten years?

A33 What child welfare services, if any, are provided by another service provider (e.g. provincial social workers do child protection, use provincial after hours screening?)

A34 What is the annual estimated value of these services?

A35 What is the primary reason why the agency does not provide these services?

B What are the core administrative staffing and related requirements of small agencies?

B1 Please describe your agency's current staffing compliment :
Number and qualifications of staff in each full and part-time position
B2 Annual costs of salaries and benefits

B3 Are your agency's salary and benefits levels competitive with other child welfare organizations?
[ ] yes
[ ] no

B4 If not, please identify the amount of funding (per year) for each affected position that would be required to match other child welfare organizations

B5 Are there any situations where you are unable to meet labour standards related to staff compensation (i.e. overtime payment) and workplace safety due to the current level of funding provided under the operations formula?
[ ] yes
[ ] no

B6 If so, please describe each incident and the estimated amount of funds required per year to comply with each standard

B7 Does your agency have adequately trained staff in order to ensure quality, culturally-based services in accordance with your level of delegation?
[ ] yes
[ ] no

B8 If not, please identify the amount of funding (per year) that would be required to fill the gap

B9 Please describe the staffing compliment (including qualifications) your agency would require to provide the full range of services needed in your community(ies). Please indicate whether they are full time or part time

B10 What funding would be required to cover staffing costs each year? _____

B11 What are the types of non-staffing costs that need to be covered in order to operate a FULL service agency, and what would be required funding to cover each of these costs per year?
[ ] capital
[ ] remoteness
[ ] other

B12 What is the gap (if any) between required costs and what you currently receive under 20-1?

B13 Is the current level of funding provided to your agency adequate to develop and maintain culturally based child welfare standards?
[ ] yes
[ ] no

B12 If not, what would be the initial development cost and the annual cost for maintaining such standards?

B13 Is the current level of funding provided to your agency adequate to develop and maintain culturally based service evaluations?
[ ] yes
[ ] no

B14 If not, what would be the initial development cost of an evaluation framework?

B15 And for conducting evaluations?

B16 Has your agency developed financial policies and procedures that comply with Generally Accepted Accounting Principles (GAAAP) and reporting requirements of both the First Nation/Tribal Council/Agency Board and INAC?
[ ] yes
[ ] no

B17 If so, what were the costs associated with this? ____

B18 Were the funds provided under the operations formula adequate to cover these costs?
[ ] yes
[ ] no

B19 If not, what would be the cost of developing such standards? ____

C How should the funding formula be adjusted to meet these requirements?

C1 What are your thoughts on the current separation in 20-1 between operational and maintenance funding?

C2 The Directive currently provides operational funding pursuant to the Status Indian child population on reserve exceeding certain population thresholds (i.e. 251, 501, and 801). Do you think this policy is effective in meeting the needs of children and families on reserve?
[ ] yes
[ ] no

C3 If not, why not?

C4 Does the fact that the Directive does not have a policy to cover deficits impact the case practice in your agency?
[ ] yes
[ ] no

C5 If so, please describe

C6 Does your agency run a surplus?
[ ] yes
[ ] no

C7 If so, how was the surplus accrued?

C8 What policies are in place regarding the use of surplus funds?

C9 In many other areas of the country, maintenance costs are funded through reimbursement of actual expenses related to children in care (running surpluses under maintenance is theoretically impossible under this regime); whereas in BC, maintenance funding under the MOU is reimbursed under an average actual cost based on provincial expenditures. What impacts, if any, do you think that setting aside the MOU in favour of the reimbursement of actual expenses would have on the annual budget of your agency?

D. What is the minimum size of agency and related population that is consistent with good social work practice and economies of scale?

D1 Please describe the differences in service approaches between the Province and your agency

D2 Please describe what the impacts for children and families have been since your agency began providing services?

D3 How do you know what these impact are (i.e. independent evaluation, testimonials, personal opinion, etc.)?

D4 How do you think your costs for service compare to what the province would incur if it were providing services in your community (ies)?

D5 Do your staff perform duties that would not be expected by employees in similar positions in large First Nations agencies?
[ ] yes
[ ] no

D6 If so, what training and support are provided to help them manage this expanded range of responsibilities?

D7 How do you cover for staff when there are temporary absences (e.g. illness, vacaion, training other lave, staff turnover/vacancies)?

D8 What costs are involved?

D9 (if applicable) How do you provide clinical supervision in those cases where staff work outside the central office of the agency?

D10 What volume of cases is necessary to ensure that social work skills do not decrease due to lack of use? (e.g. investigation skills)

D11 What allied services in your community (ies) are needed to optimize services to children and families/ (e.g. counselling, substance misuse, better housing, etc…)

D12 Do you think there is a minimum size of agency and population that is needed to ensure good social work practice and some economies of scale? What size would that be and why?

D13 Please describe any measures your agency takes to achieve economies of scale? (e.g. sharing resources with another program)

D14 As small agencies face special challenges in delivering a full range of services, there has been discussion in some areas of the country of centralizing some child welfare functions (i.e. after hours, clinical supervision, administration) in a First Nations run organization that provides support to several agencies.
Do you think this approach would work in your agency?
[ ] yes
[ ] no

D15 If not, why not?

E. General

E1 Do you have any suggestions for alternative ways of funding agencies whose child populations are less than 1,000?

E2 Would this require adjusting the current 20-1 design, or creating a different funding model altogether? Please describe

E3 What advice would you give to First Nations with small child populations, in order to ensure that successful, viable child and family services can be delivered?

THANK YOU!!

WEN:DE
Appendices

Recommendations of the Joint National Policy Review on First Nations Child and Family Services

(MacDonald & Ladd, 2000)

1. The Joint Steering Committee of the National Policy Review recognizes that Directive 20-1 is based on a philosophy of delegated authority. The new policy or Directive must be supportive of the goal of First Nations to assume full jurisdiction over child welfare. The principles and goals of the new policy must enable self-governance and support First Nations leadership to that end, consistent with the policy of the Government of Canada as articulated in Gathering Strength.

The new policy or directive must support the governance mechanisms of First Nations and local agencies. Primary accountability back to community and First Nations leadership must be recognized and supported by the policy.

2. The Joint Steering Committee recognizes a need for a national process to support First Nations agencies and practitioners in delivery of services through various measures, including best practices.

3. A national framework is required that will be sensitive to the variations that exist regionally in relation to legislation and standards. Tripartite tables consisting of representatives from First Nations, [Department of Indian and Northern Affairs] DIAND, and the province/territory are required to identify issues and solutions that fit the needs of each province/territory. Some of the issues that will need to be addressed by these regional tables consist of (but are not limited to) the following:

   a. Definitions of maintenance

   b. Identification of essential statutory services and mechanisms for funding these services

   c. Definitions of target populations (as well as the roles of federal/provincial/territorial governments related to the provision of services)

   d. Adjustment factors for new provincial programs and services- processes for FNCFS agencies to adjust and accommodate the impacts of changes in programs and services.

   e. Definition of a special needs child

   f. Dispute mechanisms to address non-billable children in care

   g. Definition of range of services

   h. Definition of financial audit and compliance comparability/reciprocity between provincial and First Nations accreditation, training and qualifications requirements of staff (e.g. licensing criteria.)

4. DIAND, Health Canada [Public Health Agency of Canada] the provinces/territories and First Nations agencies must give priority to clarifying jurisdiction and resoursing issues related to responsibility for programming and funding for children with complex needs, such as handicapped children and children with emotional and/or medical needs. Services provided to these children must incorporate the importance of cultural heritage and identity.

5. A national framework is needed that includes fundamental principles of supporting FNCFS agencies, that is sensitive to provincial/territorial variances, and has mechanisms to ensure communication, accountability and dispute resolutions mechanisms. This will include evaluation of roles and capacity of all parties.

6. The funding formula in Directive 20-1 is not flexible and is outdated. The methodology for funding operations must be investigated. The new methodology should consider factors such as workload/case analysis, national demographics and the impact on large and small agencies, and economies of scale. Some of the other issues the new formula must address but not be limited to are:

a. Gaps in the operations formula. A clear definition is required.

b. Adjustment for remoteness

c. Establishment of national standards

d. Establishment of an average cost per caseload

e. Establishment of caseload/workload measurement models

f. Ways of funding a full service model of FNCFS

g. The issue of liability

h. Exploration of start up developmental costs

i. Develop and maintain information systems and technological capacity.

7. The Joint Steering Committee found that the funding formula does not provide adequate resources to allow FNCFS agencies to do legislated/targeted prevention, alternative programs, and least disruptive/intrusive measures for children at risk. It is recommended that DIAND seeks funding to support such programming as part of agency funding.

8. DIAND must pursue the necessary authorities to enable FNCFS agencies to enter into multi-year agreements and/or block funding as an option to contribution funding, in order to further enhance the ability of First Nations to deliver programs that are geared to maintaining children within their families, communities, and reuniting those children in care with their families. This requires the development of a methodology for establishing funding levels for block funding arrangements that encompass:

a. A methodology for new and second generation agreements

b. Multi-year authorities for these programs with a criteria for measurement of success [DIAND may need to go to Cabinet to get authority for these]

9. An exceptional circumstances funding methodology is required to respond to First Nations communities where large numbers of children are at risk. Best practices shall inform the development of this methodology.

10. A management information system must be developed and funded for First Nations in order to ensrue the establishment of consistent, reliable data collection, analysis and reporting procedures for all parties (First Nations, regions, provinces/territories and headquarters.)

11. Funding is required to assist First Nations CFS Agencies in the development of their computerization ability in terms of capacity, hardware and software.

12. Funding is required for all agencies for ongoing evaluation based on a national framework and guidelines to be developed.

13. DIAND and First Nations need to identify capital requirements of FNCFS agencies with a goal to develop a creative approach to finance First Nations child and family service facilities that will enhance holistic service delivery at the community level.

14. Funding is required for ongoing standards development that will allow FNCFS agencies to address change over time.

15. Priority consideration should be given to reinstating annual cost of living adjustments as soon as possible. Consideration should also be given to address the fact that there has not been an increase in cost of living since 1995-96.

16. Phased in funding is a problem in the formula and should be based on the level of delegation from the province.

17. An immediate tripartite review (Canada, Ontario and Ontario First Nations) be undertaken in Ontario due to the implications of the 1965 Indian Welfare Agreement, current changes to the funding formula, and the Ontario Child Welfare Reform.

Losses on INAC Operations Funding Due to Lack of Inflation Adjustment

This is Exhibit "I" referred to in the Affidavit of William Colish of the City of Montreal, in the Province of Quebec, affirmed before me at the City of Toronto, in the Province of Ontario on September 2, 2022, in accordance with O. Reg. 431/20, Administering Oath or Declaration Remotely.

Commissioner for Taking Affidavits (or as may be)

DEFERRED RECORDED DIVISIONS

PRIVATE MEMBERS' BUSINESS

Pursuant to Standing Order 93(1), the House proceeded to the taking of the deferred recorded division on the motion of Ms. Crowder (Nanaimo—Cowichan), seconded by Ms. Wasylycia-Leis (Winnipeg North), — That, in the opinion of the House, the government should immediately adopt a child first principle, based on Jordan's Principle, to resolve jurisdictional disputes involving the care of First Nations children. (*Private Members' Business M-296*)

The question was put on the motion and it was agreed to on the following division:

Glossary of Terms

Administrative data. Information that is collected for either the purpose of case management or financial record keeping. It is typically stored in an information system and can be contained in a data field or in open text.

Annual Incidence. The number of child maltreatment-related investigations per 1,000 children in a given year.

Apprehension/Removal. Apprehension is a situation where a child is removed from the care of their parent or caregiver **and is typically done** by obtaining a warrant from a child welfare court after convincing the court the child is in need of protection, and a less restrictive course of action is not available or will not protect the child adequately.

Band. An Indian band is defined as "a body of Indians for whose collective use and benefit lands have been set apart or money is held by the Crown, or who have been declared to be a band for the purpose of the *Indian Act*. Many Indian bands have elected to call themselves a First Nation and have changed their band name to reflect this. With the 1985 amendment to the *Indian Act* of Canada (Bill C-31), many Indian bands exercised the right to establish their own membership code, whereby it was not always necessary for a band member to be a Registered Indian according to the *Indian Act*."[1]

Care (in) / Child in care. Denotes a child for whom the child welfare authority takes responsibility for the child as if it were a parent.

Caregiver. Caregiver(s) is used to describe a person who is providing care to the indexed child.

Caseworker/Child protection worker/Child welfare worker. Typically defined in provincial territorial child welfare legislation and refers to an authorized person to conduct child protection proceedings. This person is responsible for inputting information about a child and family into a case management system.

Child maintenance. Child maintenance is financial support provided by Indigenous Services Canada to reimburse the child welfare authority for everyday living costs of bringing up a child when the child is in care.

Child welfare/ Child protection. Child welfare and child protection are used synonymously to describe a range of services typically under the purview of child welfare legislation. Services includes intervention and prevention services.

Child welfare authority. Child welfare authority is an administrative body that is mandated to protect children under provincial / territorial child welfare legislation or *An Act Respecting First Nations, Inuit and Métis Children, Youth and Families*.

Delegated. As provinces and territories have jurisdiction over child and family services, all child and family service providers must be delegated or in the process of delegation by the province or territory and must comply, at minimum, with provincial or territorial legislation and standards.

Disparity. Disparity means *lack of similarity*. Disparity indices compare the proportion of the population of children from one ethno-racial group who experienced a specific child welfare outcome to the proportion of the child population of another ethno-racial group (usually White) that experiences the same outcome.

Disproportionality. Disproportionality means *not in proportion*. Disproportionality indices compare the proportion of children who experienced a specific child welfare outcome (e.g., investigation or placement in care) that are in a specific ethno-racial group to the proportion of children in a broader population (e.g., the general child population) in that ethno-racial group. Disproportionality does not compare ethno-racial groups to one another.

Final compensation framework. The Final Compensation Framework is a document "intended to facilitate and expedite the payment of compensation to the beneficiaries described in the Compensation Entitlement Order, as amended by subsequent Tribunal decisions" (Final Compensation Framework, s.1.3). It was prepared following discussions between the respondent (Attorney General of Canada) and the complainants (Assembly of First Nations, First Nations Child and Family Society) with input from the Canadian Human Rights Commission, Chiefs of Ontario, and Nishnawbe Aski Nation.

1 Statistics Canada. (n.d.). *Membership in a First Nation or Indian band.* https://www12.statcan.gc.ca/nhs-enm/2011/ref/dict/pop070-eng.cfm

First Nations. "First Nations people" refers to Status and non-status "Indian" peoples in Canada. Many communities also use the term "First Nation" in the name of their community. Currently, there are more than 630 First Nation communities, which represent more than 50 nations or cultural groups and 50 Indigenous languages.[2]

First Nations Status. An individual recognized by the federal government as being registered under the Indian Act is referred to as having First Nations Status

Foster care. Foster care (also known as out-of-home care) is a temporary service provided by a child welfare authority for children who cannot live with their families. Children in foster care may live with relatives or with unrelated foster parents.

Indigenous. In Canada, the term Indigenous peoples (or Aboriginal peoples) refers to First Nations, Métis, and Inuit peoples.[3]

Indigenous data governance. Indigenous data governance includes both the stewardship and the processes necessary to implement Indigenous control over Indigenous data (collection, storage, analysis, use, reuse).

Inuit. Inuit are the Indigenous people of Arctic Canada. About 64,235 Inuit live in 53 communities in: Nunatsiavut (Labrador); Nunavik (Quebec); Nunavut; and Inuvialuit (Northwest Territories and Yukon). Crown-Indigenous Relations and Northern Affairs Canada (2019). Indigenous peoples and communities.[4]

Kinship care. Kinship care refers to the care of children by relatives or, in some jurisdictions, close family friends.

Legacy system. Legacy systems are information systems that were previously used by a child welfare authority.

Level of identification and substantiation. There are four key levels in the case identification process: detection, reporting, investigation, and substantiation. Detection is the first stage in the case identification process. This refers to the process of a professional or community member detecting a maltreatment-related concern for a child. Little is known about the relationship between detected and undetected cases. Investigated cases are subject to various screening practices, which vary across jurisdictions. *Substantiation* distinguishes between cases where maltreatment is confirmed following an investigation, and cases where maltreatment is not confirmed. Typically, there is three-tiered classification system, in which a suspected level provides an important clinical distinction for cases where maltreatment is suspected to have occurred by the investigating worker but cannot be substantiated.

Notice plan. The Notice Plan allows members of the class to determine whether they wish to apply for or opt out of a compensation process.

Maltreatment. The term maltreatment includes acts of commission (abuse) or omission (neglect) that are interpreted as being detrimental to children and requiring intervention.

Métis. Métis are "a distinctive peoples who, in addition to their mixed ancestry, developed their own customs and recognizable group identity separate from their Indian or Inuit and European forbearers."[5]

Ongoing child welfare services. Ongoing child welfare services are typically those that are provided to a child or family after an investigation about the concern has been completed. The caseworker decides whether the situation requires ongoing child welfare involvement.

Permanency. Child welfare authorities use a variety of strategies to achieve permanency for children. Permanency planning involves time-limited, and goal-oriented activities to maintain children within their families of origin or place them with other permanent families. Permanency plans include the goal for permanency, the tasks required to achieve the goal, and the roles and responsibilities of all involved.

2 Government of Canada. (2021). First Nations. https://www.rcaanc-cirnac.gc.ca/eng/1100100013791/1535470872302
3 Government of Canada. (2021). *Indigenous peoples and communities.* https://www.rcaanc-cirnac.gc.ca/eng/1100100013785/1529102490303
4 Government of Canada. (2021). *Inuit*. https://www.rcaanc-cirnac.gc.ca/eng/1100100014187/1534785248701
5 Government of Canada. (2021). *Métis Rights*. https://www.rcaanc-cirnac.gc.ca/eng/1100100014413/1535468629182

Prevalence. Prevalence refers to the proportion of a population that has experienced a phenomenon.

Prevention. Typically, prevention is a type of child welfare service that is intended to prevent the occurrence of an outcome such as placement or further child welfare involvement.

Placement. Out-of-home placement includes voluntary care agreements and placements in residential, foster, and community or kinship care.

Residential care. Residential/secure treatment: A 24-hour residential treatment program for several children that provides room and board, intensive awake night supervision, and treatment services.

Risk. No specific form of maltreatment alleged or suspected. However, based on the circumstances, a child is at risk for maltreatment in the future due to a milieu of risk factors. For example, a child living with a caregiver who abuses substances may be deemed at risk of future maltreatment even if no form of maltreatment has been alleged.

Spell in care. A spell in care is a continuous period of care denoted by a start and end date. A child can have multiple placements within one spell in care.

Foreword

This report is the product of a year-long effort to compile and consolidate information that may support the implementation of the *2019 CHRT 39* decision to compensate First Nations children who were removed from their families and communities through child welfare intervention or experienced denials or delays in receiving essential public services. Specifically, by request of the First Nations Child and Family Caring Society and with funding from Indigenous Services Canada, the project was initiated to minimize the burden on individual claimants to prove their eligibility through two main tasks: 1) to review the availability and gaps in data that could help identify potentially eligible claimants under the *2019 CHRT 39* decision, and 2) to provide certain considerations for the compensation process related to the CHRT decision.

The need for compensation follows decades of discriminatory funding and policy toward First Nations children and their families and communities, found by the Canadian Human Rights Tribunal (CHRT) to be "wilful and reckless" on the part of the Government of Canada. The *2019 CHRT 39* decision attempted to provide redress for this discrimination through compensation to First Nations children and some of their caregivers for experiences dating back to 2006. In parallel, two class action lawsuits have formed to redress discrimination against First Nations children and their caregivers, covering a longer timeframe from 1991. In December 2021, agreements-in-principle were reached to seek a settlement agreement for compensation related to *2019 CHRT 39* and the two class action lawsuits. While this report was primarily designed to support the compensation process for the *2019 CHRT 39* decision, where feasible, we also address compensation issues that might relate to the broader settlement agreement. However, the timing of the report relative to the settlement agreement process meant that we were limited in our ability to comment on emerging eligibility requirements.

The findings contained in this report highlight significant gaps in available data to help identify claimants due in part to the decentralized nature of health and social services in Canada and the lack of data management infrastructure for historical data at a federal level. The limitations of available data described in this report do not illustrate a clear and systematic path forward for compensation. This should not be seen as a deterrent to the implementation of a fair and equitable compensation process, but rather as an opportunity for a less burdensome, legalistic, and traumatizing process than has been done in past efforts to rectify injustices against First Nations children and communities.

As a team of independent researchers, our role was not to provide a framework for compensation. Rather, the report is designed as a reference document to support stakeholders as they develop and implement a compensation process. These decisions must be driven by First Nations representatives. We hope that by providing information about the availability of data and experiences from previous compensation processes, this report can help support the timely development of a compensation process that reduces the likelihood of burden and retraumatization for both individuals and communities.

Acknowledgements

This project was funded by Indigenous Services Canada at the request of the First Nations Child & Family Caring Society.

The Project Co-Coordinators Marie Saint-Girons and Johanna Caldwell led this project with integrity, intelligence, and a vision for the work that started and ended with accountability to First Nations children, their families, and their communities.

We wish to acknowledge the many research assistants who were instrumental in moving this project forward: Leyco Wilson, Lisa Paul, Graham Rotenberg, Joseph Mercado, Szymon Rodomar, Marina Sistovaris, Eden Haber, and Eliza Livingston, as well as the contributions of Genevieve Sansone, Tara Black, and Laura Best in finalizing the report. We are also indebted to the advisors, Cheryl Milne and Ashley Quinn, who helped guide the research process. Our intrepid graphic designer, Leah Gryfe, made it possible for us to present our complex findings in a way that is accessible in this report.

This project would not have been possible without the time, knowledge, and reflections of key informants in child welfare authorities across Canada as well as staff at Indigenous Services Canada. We would like to extend our sincere gratitude for their patience and dedication in clarifying the availability and applicability of data to the compensation process.

Finally, we would like to thank the members of the National Advisory Committee (NAC) working group for their valuable insight and advice throughout each stage of the project.

—*Co-Principal Investigators:*
Professor Barbara Fallon
(Factor-Inwentash Faculty of Social Work,
University of Toronto) and
Professor Nico Trocmé
(Director of the Faculty of Social Work at McGill University)

Executive Summary

This report presents the findings of a project designed to provide background information to support the implementation of the *2019 Canadian Human Rights Tribunal* (*CHRT) 39* order to compensate First Nations children who have been denied the right to stay safely with their families and to receive adequate medical care or social services because of discriminatory policies and practices put in place by the federal government. Many of the findings from this report may also help inform the agreements-in-principle (AIP) reached on December 31, 2021, that could help settle the *2019 CHRT 39* along with two parallel class action lawsuits, which have sought compensation for overlapping classes of individuals. The project was completed by a team of independent researchers led by Barbara Fallon (University of Toronto) and Nico Trocmé (McGill University), funded by Indigenous Services Canada (ISC) at the request of the First Nations Child and Family Caring Society (FNCFCS; "Caring Society"). The report builds on the *Taxonomy of Compensation Categories for First Nations Children, Youth and Families related to 2019 CHRT 39* (Sistovaris et al., 2019), prepared by the University of Toronto research team.

This project was initiated in an effort to minimize the burden on individual claimants to prove their eligibility, one of clear intentions of the CHRT decision. The project team was asked to support the future implementation of the decision through two main tasks:

1. Review the availability and gaps in data that could help identify potentially eligible claimants under the *2019 CHRT 39* order, and
2. Provide certain considerations for the compensation process, including the notice plan, for applicants to receive compensation under this decision.

Differences were noted between the *2019 CHRT 39* order and the AIP. These differences, as well as remaining ambiguities, are listed below:

Timeframe of eligibility. The information currently available on the AIP reached by the parties suggests that the timeframe for eligibility for the Removed Child class goes from April 1, 1991, to March 31, 2022, whilst the timeframe of eligibility for the Jordan's Principle class goes from April 1, 1991, to November 2, 2017.[1] This extends the timeframe of eligibility originally granted under *2019 CHRT 39*. Given that the project mandate was tied to the CHRT order, the outreach conducted by the team focused on data available from January 2006 to present for the child welfare compensation categories and from December 2007 to November 2017 for the Jordan's Principle compensation categories.

Eligibility under the Removed Child class. The current information available on the negotiated settlement suggests that the Removed Child class includes children who "were taken in out-of-home care".[2] At the date of writing the report in January 2022, it is unclear whether out-of-home care only includes formal out-of-home care arrangements (i.e., excludes informal kinship services) and whether out-of-home care includes placement with extended family and placement within the community. The Sotos website also specifies that "length of time in care; number of out-of-home placements, and [placement] in care on or off reserve" could be used to determine the final compensation amount. These factors were not included in the *2019 CHRT 39* order. As a result, the project team did not specifically ask about these concepts when reaching out to respondents, but information on certain proxies is included, which could be helpful in understanding the availability of this information.

Eligibility under the Jordan's Principle class. The current information available on the negotiated settlement states that the Jordan's Principle class includes children who "experienced delays or denials of a public service or product contrary to Jordan's Principle."[3] This does not specify whether this class would also include denied or delayed group requests for public services or products. It also suggests that the Jordan's Principle class does not include children who experienced service gaps, but made no requests for services. As a result of this, the review of Jordan's Principle data availability in this report focuses primarily on denials and delays.

Primary caregivers. As of yet, publicly available information does not specify which primary caregivers would be compensated. As such, it is not yet possible to confirm whether primary caregivers who physically, sexually, or emotionally abused their children are excluded.

3 Ibid.

The report includes (**I**) an overview of service delivery and challenges related to the use of administrative data to document access to health and social services for First Nations children and their families; (**II**) an analysis of the availability of administrative data to inform a compensation process; and (**III**) documentation of process-related concerns from respondents, a review of lessons learned from past Canadian and international settlement processes, and literature on retraumatization.

The Delivery and Documentation of Services to First Nations Children

The structure of health and social services to First Nations children in Canada

Child welfare services for First Nations children are administered in Canada at the federal, provincial, territorial, and band level, resulting in a complex web of policies, structures, and services that vary across these jurisdictions. First Nations children involved with child welfare are subject to different mandates and funding based on their place of residence. First Nations children ordinarily resident on-reserve may interact with a locally run First Nations child welfare agency or one run by the province, while First Nations children living off-reserve who come in contact with child welfare are likely to interact with the provincial authority that serves the area where they live. A small number of urban Indigenous child and family services agencies serve First Nations children off-reserve in urban settings.

Ongoing patterns of First Nations overrepresentation in child welfare systems are consistently documented in both national and provincial data (Fallon et al., 2021; Sinha et al., 2011). According to the First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect (FN/CIS-2019), investigations involving First Nations children were 17.2 times as likely to result in placement in formal out-of-home care compared to investigations involving non-Indigenous children (Fallon et al., 2021). Child welfare involvement is consistently shown to be overwhelmingly related to neglect cases which often intersect with poverty, inadequate housing, and other inequities disproportionately experienced by First Nations families in Canada (First Nations Child and Family Caring Society, 2013; Trocmé, Knoke, & Blackstock, 2004).

The allocation of **healthcare responsibility** for Indigenous peoples—which includes First Nations, Inuit, and Métis—is often referred to as a "jurisdictional patchwork" (Gouldhawke, 2021, n.p.) of policies, legislation and relationships (Government of Canada, 2021a, n.p.; Behrend, Forsyth & Mohamed, 2021, p. 4). Responsibility is "divided between the provinces, territories, the federally-funded Non-Insured Health Benefits (NIHB) program for First Nations and Inuit, and finally, limited Métis programs via Indigenous Services Canada [ISC]" (Gouldhawke, 2021, n.p.). **Jordan's Principle** is a "child-first" principle adopted by unanimous support of the House of Commons in 2007 designed to ensure that in situations where there is a funding dispute between federal and provincial governments, or between federal departments with regards to the provision of essential services,[4] First Nations children do not experience delays, disruptions, or denials of services typically available to other Canadian children (Government of Canada, 2019). Under provisions of Jordan's Principle, the government department of first contact is required to pay for the service(s) provided to a First Nations child and resolve any funding issues after services are provided (Government of Canada, 2019). Jordan's Principle is named in honour of Jordan River Anderson, a First Nations child from Norway House, Manitoba, requiring complex care who died in hospital far from his community while the federal and provincial governments battled over funding responsibilities for Jordan's at-home care needs (Government of Canada, 2019).

The use of administrative data to document the delivery of services

The decentralized nature of child welfare and health and social services delivery in Canada poses a fundamental challenge to the collection, management, storage, and use of administrative data (Laferrière & Deshaies-Moreault, 2018). **Administrative data has specific advantages** over competing sources of data for decision makers (Administrative Data Research UK, n.d.; Powered by Data, 2018a, 2018b). The advantages of administrative data include but are not limited to cost efficiencies; a high level of data detail; flexibility to utilize data for longitudinal research; the ability to minimize the burden on respondents; and the ability to share or link data.

4 This includes, but is not limited to, services such as mental health, special education, dental, physical therapy, speech therapy, medical equipment and physiotherapy.

Indigenous data is information that reflects and impacts the collective and individual lives of Indigenous peoples, and includes lands, resources, cultural information, traditional knowledge, and information about individuals, families, and communities (Carroll et al., 2020; Rainie et al., 2019). The collection and management of information and data related to Indigenous peoples by non-Indigenous researchers or institutions raises ethical issues and concerns. These concerns stem from colonial and assimilationist practices and policies within Canada – such as the *Indian Act* of 1876, the White Paper of 1969, residential schools, and the Sixties Scoop – that have forcefully suppressed and marginalized Indigenous identities and cultures over generations. Research and evaluation efforts related to Indigenous peoples have historically been conducted from a Euro-centric perspective that does not respect or understand Indigenous values and traditions and systematically excludes them from decision-making that affects their communities (Ormiston, 2010).

The feasibility of using administrative data to support the identification of claimants seeking compensation was the primary task for this year long project. We found that the limitations of administrative data which include variation in data collection methods and data quality; accessibility issues arising from ethical, privacy and confidentiality concerns; and impact of infrastructure and funding on the quality of administrative data systems were amplified due to the fragmented service delivery systems to First Nations children (see Section 1).

Data Availability

In order to assess the availability and quality of administrative data that could assist in identifying eligible claimants under the *2019 CHRT 39* compensation categories, a framework detailing the types of information needed to determine eligibility under each compensation category was developed. The framework includes a list of data fields that, **if available and of high quality**, could assist with the process of assessing claim eligibility under the CHRT child welfare (Table 2.1) and Jordan's Principle (Table 2.8) compensation categories. Potential administrative data sources were identified at a national and jurisdictional level and respondents who had knowledge about these data sources were asked about data availability, completeness, and accuracy. Finally, we analyzed the applicability of these data to child welfare and Jordan's Principle compensation categories.

Child Welfare Data

The **First Nations Child and Family Services (FNCFS) program** funds child prevention and protection services for First Nations children and families on-reserve or ordinarily resident on-reserve. The data holdings pertain to information on child maintenance costs for First Nations children on-reserve that are provided on a monthly basis to ISC either by FNCFS agencies or by provincial/territorial governments. The FNCFS program is administered at a regional level in the following regions: Alberta, Atlantic (New Brunswick, Nova Scotia, Newfoundland and Labrador, and PEI), British Columbia, Manitoba, Ontario, Quebec, Saskatchewan, and the Yukon. In fiscal year 2013-2014, the FNCFS program implemented a national information system to store child maintenance data funded by ISC. Prior to that fiscal year, FNCFS child maintenance data was decentralized and region-specific. The report describes both the data available through the national Information Management System (IMS) from FY 2013-2014 onwards, and the data held at a regional level for FYs prior to 2013-2014.

The project team also reviewed information systems from **sampled child welfare authorities** in provinces and territories across Canada. We gathered information about data in 1) mainstream or child welfare authorities not specifically delegated to serve First Nations communities by surveying information system(s) used in each province and territory, and 2) First Nations agencies, where possible and applicable. The non-random sample of approximately 150 key informants was designed to provide information on the range of information systems being used across Canada but was not designed to be representative of specific provinces (unless otherwise specified in the report). We were not able to independently verify the level of detail regarding the availability, completeness, and accuracy of data collected.[5]

A summary of our findings regarding child welfare data availability from the FNCFS program and from sampled child welfare agencies across Canada is available in the following table. For more details on the availability and quality of data, please refer to Appendix J for an overview of FNCFS data collected by ISC regions between FY 2005-2006 and FY 2013-2014, Appendix I for information on data in the IMS used by the FNCFS program between FY 2013-2014 and present; and Appendix P for the results of our outreach to sampled child welfare authorities across Canada.

5 To protect confidentiality and minimize response burden the project team did not have direct access to the data sources.

Table 1. Summary of findings regarding data availability in the FNCFS program and sampled child welfare agencies

Information of interest	Availability in FNCFS data		Availability in sampled child welfare authorities
	FY 2005-2006 to 2013-2014	FY 2013-2014 to present (IMS)	
Can the child be identified?	*Child name* and *date of birth* was systematically collected across regions, except for ATL Region (in that region, child's date of birth was not available in forms provided from FY 2005-2006 to 2008-2009 and FY 2010-2011 to 2012-2013). Variability noted across regions in the collection of the child's *Indian Registration Number*: • Field collected in QC, ON, SK, and BC for all FYs examined (FY 2005-2006 to 2012-2013). • In AB and MB regions, only the Treaty or Band number was collected from FY 2007-2008 2009-2010 and from FY 2005-2006 to FY 2007-2008 respectively. • The field is not collected in the YK region until FY 2012-2013 and unavailable in forms from the ATL region for FYs 2006-2007, 2008-2009, 2010-2011, and 2012-2013.	*Child name*, *date of birth* and *Indian Registration Number* are all collected by the IMS, with high levels of completeness. Some minor typos were noted for the child's name and date of birth when the child was not registered for status.	All sampled child welfare agencies in each jurisdiction collected the *Child Name*, *Date of Birth*, and *Indian Registration Number*. • Despite occasional typos noted with the *Child Name* and *Date of Birth*, the completeness of the data for these two data fields was generally high. • The child's *Indian Registration Number*, is often missing or unknown to workers in child welfare agencies in AB, BC, NWT, ON, PEI, QC, and YK, even for children with status, and there were rarely any validation procedures in place to ensure that the information was accurate. There would be significant data quality issues to address if these data are used to help identify eligible children.
Is the child First Nations and does he or she live on-reserve?	Child maintenance forms are used to document maintenance costs for *First Nations children* ordinarily *resident on-reserve*. Some of the child maintenance forms reviewed specifically asked about the *child (or parent's) residence on or off reserve* (available in forms from Alberta region from FY 2010-2011 to 2012-2013; and forms from BC, ON, and SK regions from FY 2005-2006 to 2012-2013)	While data regarding child's *First Nations identity* or *residence on-reserve* is not listed as a data field in the IMS, FNCFS child maintenance data only concerns First Nations children ordinarily resident on-reserve who are placed in out-of-home care. **Issues with applicability to compensation categories:** • Small differences in practices for determining residence on or off-reserve across regions (e.g. in MB, it is where the child is taken into care that determines who funds services). • The definition of First Nations children used by the FNCFS program does not include "individuals who have been recognized as citizens by their First Nations" but are not eligible for status.	There is considerable variability in the quality of the information regarding the child's *First Nations identity*: • NWT, Nova Scotia, Ontario, PEI, and Quebec highlighted medium or high issues with missing or unknown data for this field. • In delegated FNCFS agencies sampled, the child needed to be from the First Nations band associated with the agency to receive services from the CFS agency. As such, even though these sampled agencies did not have a specific data field for this, it is reasonable to assume that the child placed by these specific agencies is First Nations. • **Issues with applicability to compensation categories:** In NS, although some information on race is collected, this does not include whether a child is First Nations. Ministries in AB, BC, MB, N&L, ON, and QC were the only systems that specifically collected information on *child residence on/off reserve*. • Completeness issue noted in BC, MB, N&L, and QC • Accuracy issues noted in AB, N&L, ON, and QC. • In other sampled agencies (i.e., NB, NWT, NS, PEI, SK, and a First Nations agency in ON) it is the *child's address of residence* that is documented. Some accuracy issues (including typos in addresses or addresses not being up-to-date) have been noted across jurisdictions.

(continued on following page)

Table 1. Summary of findings regarding data availability in the FNCFS program and sampled child welfare agencies *(continued)*

Information of interest	Availability in FNCFS data		Availability in sampled child welfare authorities
	FY 2005-2006 to 2013-2014	FY 2013-2014 to present (IMS)	
Can the caregiver at the time of removal be identified and are they First Nations?	The parent or guardian name is available in some child maintenance forms • Specifically: in ATL region in FY 2011-2012, in MB region from FY 2006-2007 to 2012-2013, as well as in BC, ON, and Saskatchewan for FY 2005-2006 to 2012-2013.	No information on the caregiver is included in the national IMS. • This information may be available from child maintenance forms accessible through ISC regions.	The *caregiver's name* was collected in all sampled agencies. • Completeness issues identified in AB, BC, N&L, and QC. • **Issues with applicability to compensation categories:** Respondents from AB, BC, MB, and NB all indicated that caregiver's name is identified when a case is open, but it is difficult to determine with certainty if this was the child's caregiver at the time of removal. The *caregiver's Indian Registration Number* was available in agencies sampled in AB, BC, MB, NB, N&L, NWT, NS, ON, SK, and the YK. • Issues with missing or unknown information were noted in AB, BC, N&L, NWT, NS, QC, ON, and the YK. • There were often no validation procedures in place to ensure that the information was accurate. All sampled agencies collected some information on the *caregiver's First Nations identity*, except for the First Nations agency sampled in Quebec. • Missing or unknown information noted in AB, BC, NWT, NS, ON, PEI, and QC. • Accuracy issues noted in QC and the YK and applicability issues identified in NS.
When was the child placed?	*Dates of placement* were usually available. • Regions that did not have this information were the YK (all FYs examined), SK (FYs 2005-2006 and 2006-2007), and the ATL (although it is available in FY 2009-2010). • **Issues with applicability to compensation categories:** This does not provide enough information to determine if a child *moved* between different placements during a spell in care. Placement start and end date could provide an indication of *length of time in care*, but information would need to be reliably collected and stored across all FYs for it to be usable.	The days during which a child had a child maintenance expense (*Start Pay Date* and *End Pay Date*), are mandatory fields in the IMS and have a high level of accuracy. • **Issues with applicability to compensation categories:** These data fields are attached to the *payment of a placement* and do not provide enough specificity to determine if a child moved between different placements during a spell in care. They do provide an estimate of the length of time in care starting in FY 2013-2014. If a child was in care prior to that date, this information would need to be linked across databases.	All agencies sampled collected data on the *start and end date of each placement* • The quality of this information was high across all child welfare agencies sampled. • The information was usually considered as accurate because it is tied to child maintenance costs reimbursed by the provincial or federal government. • Some provinces noted minor errors (i.e., differences of a few days) • If recorded consistently across different years, this information could potentially serve as a proxy for moves in care.

(continued on following page)

Table 1. Summary of findings regarding data availability in the FNCFS program and sampled child welfare agencies *(continued)*

Information of interest	Availability in FNCFS data		Availability in sampled child welfare authorities
	FY 2005-2006 to 2013-2014	FY 2013-2014 to present (IMS)	
Was the child placed outside of their community?	The child or parent's *address of residence* at the time of removal and the *address of placement* can be compared to determine if a child was placed outside of their community. • The parent's address was only collected by BC and ON regions. • However, no information on address of placement was found. • **Issues with applicability to compensation categories:** Given that address of residence cannot be compared to address of placement, this information cannot be used to determine placement outside of a community.	Information on the address of residence and the address of placement is not available in the IMS.	*Residence at the time of removal:* • Issues with missing or unknown data were noted in AB, MB, N&L, and ON. • The address can also be subject to small accuracy errors (including typos in addresses or addresses not being updated at the time of removal). • Key informants in NS and PEI indicated that a child (or caregiver's) address is automatically updated in a live field (meaning the previous information is not retained) once a family changes residence. This means that retrieving information on previous addresses and the dates of that residence would be difficult. *Address of placement* is more consistently collected • Accuracy issues have been noted, especially for placements on reserve (e.g., in the NWT). • Minor issues with missing or unknown information regarding placement address were noted in AB, NWT, BC, and QC, with key informants in ON and NB noting more substantive issues with completeness.
Was the child placed outside of their family?	If collected, *placement type* could provide an indication as to whether the child was placed in kinship care (i.e., with extended family) or not. • Placement type was available in AB (FY 2007-2008 onward), the ATL (FYs 2009-2010 and 2011-2012), BC (FY 2006-2007 onward), MB (FY 2005-2006 and FY 2012-2013), and for from FY 2005-2006 to 2012-2013 in ON, QC, and SK.	Placement type information, including whether the child was placed in kinship care, is available for all ISC regions except MB. • **Issues with applicability to compensation categories:** It is important to note that the types of placement and definition of kinship care vary considerably across provinces.	*Placement type* was documented across all jurisdictions. • BC, MB, ON, PEI, and YK all identified issues with the accuracy of responses provided by workers. • **Issues with applicability to compensation categories**: Kinship care was not documented in MB. In the agencies that provided a definition of kinship care (i.e., AB, BC, and SK) the definition includes close friends or neighbours as possible kinship care arrangements. This term could not be used as a direct estimate of placement outside of the family, if family is defined as not including extended community members.

(continued on following page)

Table 1. Summary of findings regarding data availability in the FNCFS program and sampled child welfare agencies *(continued)*

Information of interest	Availability in FNCFS data		Availability in sampled child welfare authorities
	FY 2005-2006 to 2013-2014	FY 2013-2014 to present (IMS)	
Why was the child placed?	Information on *reason for placement* is unavailable, except for in one form used by Manitoba ISC region.	Information on reason for placement is unavailable in the IMS.	The *type of maltreatment investigated* was collected by nearly all sampled agencies. • Respondents in AB, YK, NS, and ON highlighted issues with missing data. • In some cases, the maltreatment type includes information on who perpetrated the abuse. If not, most provinces include information on the name of the *alleged perpetrator of maltreatment*. However, this information is sometimes difficult to retrieve because it is not available in one data field. The *substantiation* of the maltreatment or risk of maltreatment is generally collected. • However, some provinces like ON or BC do not measure substantiation directly (e.g., in ON, a concern is verified – rather than substantiated). • Furthermore, the evidentiary threshold used to determine level of substantiation varies across provinces. In some provinces/territories, following the investigation, the worker is asked about the *reason for placement*. In other provinces, such as Alberta, information beyond substantiation of an initial investigation is not collected. **Issues with applicability to compensation categories:** • Administrative systems generally include different types of physical abuse, sexual abuse, emotional/psychological abuse, and neglect. In some provinces – like ON - it is difficult to map investigation reasons directly unto these 5 categories because there are more than a hundred possible reasons for investigation, which are not always tied to maltreatment. • Definitions used to describe different types of abuse and neglect vary between jurisdictions (e.g., inadequate nurturing or affection is recorded as psychological abuse *or* neglect, depending on the jurisdiction). • Investigated maltreatment at the time of an investigation does not always reflect the reason why a child was placed. • Nearly all respondents indicated that it would be difficult to determine whether a child was *placed in order to receive essential services* because this was not formally considered as a reason for placement in their jurisdiction.

Jordan's Principle Data

In order to identify information related to the potential eligibility for compensation under Jordan's Principle categories of *2019 CHRT 39*, we assessed multiple sources of information across jurisdictional levels. As defined in the Jordan's Principle compensation category decision tree (see Figure 2 in main report), we considered **delays and denials** as situations where a request for a service had been made and there was either a delay or a denial. **Service gaps** were defined as either 1) a request had been made but there was a difference in the requested and accepted amount, or 2) no request had been made, but a child's identified needs were not met. However, since the current AIP does not include gaps in services as an eligibility requirement for the Jordan's Principle class, our analysis focused primarily on situations where a request *has* been made.

Jordan's Principle. We began by investigating what information was collected centrally at Indigenous Services Canada by the Jordan's Principle team. Documentation of Jordan's Principle requests reflects the evolving trajectory of Jordan's Principle implementation since 2007. Prior to 2017, there was no systematic data collection and most requests were redirected to other existing programs at ISC. Due to a high level of turnover in Jordan's Principle staff, there is also a substantial loss of institutional memory. The most reliable and accessible data pertaining to Jordan's Principle requests are found in more recent years. Beginning in Fiscal Year 2017-2018, a more systematic approach to data collection was implemented to collect detailed information regarding requests, approvals, denials, as well as the date of a request and the date of a response, which can be used as a proxy for delay. For FY 2017-2018, there is significantly more information available on individual Jordan's Principle requests, compared to group Jordan's Principle requests. More detailed information on the gaps and availability of data regarding Jordan's Principle requests in FY 2017-2018 is available in Appendix S.

NIHB. Claims submitted to the NIHB for medical benefits, including prescriptions, equipment, and supplies are documented in multiple information systems according to the benefit type. These systems, and the availability and limitations of these data holdings, are documented in Table 2.12. NIHB data is limited to claims adjudicated under its purview, and includes information related to claimant name, date of claim, date of approval/denial, and reason for denial. Like Jordan's Principle information, this data is structured according to requests along with information about how the request was processed which may aid in assessing compensation eligibility. However, communication with NIHB staff indicated several important limitations of using this data for the purposes of supporting compensation. These limitations relate to: lack of detail on certain individual services due to NIHB contribution agreements and transfer arrangements with communities and contracts with service providers; underrepresentation of service utilization; lack of information on residency due to data tied to Indian Registration Number rather than residence; and the administrative nature of the system which does not accurately demonstrate approval rates. Despite these limitations, NIHB may be an important source of data to determine claimant eligibility.

Other ISC Programs. We requested detailed information regarding data collected related to Home and Community Care, the Children's Oral Health Initiative, Mental Wellness, and certain programs from the Education department and the Social services, policies, and planning department. For programs that responded, no information exists on the dates of a request for services, the date of a decision, the reason for a decision, or the difference between approved and requested amounts. Only information about the client, the type of service provided and on what date that service was provided was available. This limits the capacity to use the information provided from these programs to identify children eligible for compensation under Jordan's Principle compensation categories.

Community level data. We identified two sources of community-level information that could be of use to the compensation process. First, the Community-Based Reporting Template is used to collect information regarding service delivery at the community level. Service delivery information collected using the CBRT could be cross-referenced with all communities to determine where this service delivery was not reported. Second, the Community Profiles Database, held by the Synergy in Action team at ISC, documents socioeconomic and demographic information about First Nations communities, including multiple indicators of remoteness and isolation. These data could be used to provide important contextual information regarding individual access to needed services.

Additional administrative data. Additional administrative data from provincial and territorial health and social services could be useful to identify First Nations children who experienced a delay or denial of services. Given the focus of the current project, the project team did not meet with key respondents with information about these data holdings. However, this could be an avenue to explore when implementing the compensation process.

Considerations for the Compensation Process

The second part of our project mandate was to comment on considerations for the compensation process. We approached this objective in three ways. First, in our discussions with respondents regarding availability of data for child welfare and Jordan's Principle compensation categories, we documented concerns regarding the compensation process itself. Second, we conducted an extensive review of Canadian and international settlement processes and summarized lessons learned from these past processes. This involved a review of academic and 'grey' literature along with publicly available information, and interviews with multiple individuals with experience related to past Canadian settlements. Third, we conducted a review of social science literature regarding retraumatization, a concern that was repeatedly expressed in our review of past settlements. Findings from each of these activities are summarized below.

Stakeholder consultations

Stakeholder concerns are summarized under four main considerations.

Data confidentiality and ownership: Some child welfare agencies expressed concern about sharing their data to help identify children given past misuse of data and current concerns about the confidentiality of the children and families. Questions from key respondents included how the central administrator will be given the mandate to obtain identifying information about children in families in order to create a "pool of eligible applicants" as per the Compensation Framework.

Agency responsibility. While the CHRT decision holds the federal government accountable, removal decisions are made locally. Especially in small communities, the *ongoing* nature of the child welfare eligibility under the CHRT creates a challenging situation for these agencies. Specifically, we heard concerns regarding possible blame on CFS agencies who removed a child, but who are also helping claimants access compensation.

Agency capacity. While the compensation decision aims to alleviate the burden on individual claimants, a standard of proof that requires documentation to access compensation will inevitably involve agency participation. Key respondents indicated that they are already overworked and are concerned about the time and resources needed to help identify claimants. Several recommendations were made to hire more staff to account for this increase in workload.

Access to compensation and support after receipt of compensation. Respondents have expressed the need to ensure that vulnerable and isolated individuals will receive compensation, and that they will receive adequate support after receiving compensation.

Review of national and international settlement processes

The process of compensating marginalized groups for past persecution is complex and requires thoughtful planning. Canada, Australia, New Zealand, Germany, and other jurisdictions have settled lawsuits and created compensation schemes that aim to repair, to the extent possible, harms they perpetuated. Although each compensation scheme is procedurally different, common themes emerge: 1) effectively communicating with the eligible claimants, 2) creating claimant-friendly application processes, and 3) leveraging technology to execute these processes efficiently and cost-effectively. Key lessons-learned from past settlements, as they relate to different phases of a compensation process are summarized below.

Notifying claimants

Simplify notice plan. Ensuring applicants are aware of the existence of a compensation scheme is essential to its success. However, notice plans have created confusion in affected communities. A notice plan should clearly explain the eligibility criteria where possible and describe how to troubleshoot intake issues. All explanations of the eligibility criteria should be explained using plain, widely spoken languages, and be explained in an accessible manner for claimants. Consulting key stakeholders (including eligible claimants) about the design of the notice plan will improve accessibility and clarity of communications regarding the compensation process.

Tailor communication to different audiences. Notice plans have typically called for applications in Canada's official languages, ignoring Indigenous communities' preferred language and modes of communication. Considering the varying needs and resources of communities is essential to reaching eligible applicants and ensuring compensation schemes promote reconciliation

and healing. Developing communications plans that are tailored to age, geography, band, agency, etc. can increase applications, reduce costs by limiting difficulties processing incomplete applications, and promote reconciliation by reducing application processing times.

The application process

Participatory, Indigenous-led design of application processes. Centring Indigenous legal paradigms and community supports can more faithfully advance reparative justice initiatives. Western legal systems should not be all-encompassing. Indigenous legal traditions should be incorporated explicitly, or entirely, in providing legal remedies. Spatial and temporal restrictions on eligibility that comport with exclusively Western legal ideas should be minimized wherever possible.

Simplify forms. Every compensation process requires a claimant to complete an application. Claimants have criticized these processes because applications are lengthy, deploy legalistic language, and overemphasize the burden of producing documentation on claimants to support their claims. This process is intrinsically retraumatizing and costly. Forms must be more user-friendly by becoming shorter, produced in multiple (Indigenous) languages and include visualizations to simplify instructions. Both paper and online options for application completion should be available to accommodate diverse First Nations communities.

Progressive disclosure. Progressive disclosure – the process by which a claimant reveals more about their abuse or trauma as they build trust with others – has largely been absent from determinations about the length of the compensation period. Allowing for application extensions and broadening the window of eligibility for compensation could help application processing procedures become more accommodating of claimants needs and aware of the pressures of retraumatization.

Legal support. Many past processes have not had free legal advice or appropriate application supports available for claimants. Some applicants experienced fraud, were retraumatized by overly jargonistic language, and did not feel as though they had the inclusive supports they needed. Providing legal support free-of-charge, understanding literacy rates in the community, conferring with community leaders to determine the types of supports preferred, and having a flexible review process will improve compensation processes.

Mental health supports. A toll-free helpline is a start but may not be sufficient to support the mental health needs of many individuals and communities affected by the compensation process – especially if it is understaffed. Indigenous healing supports, in addition to in-person mental health resources and counselling, are crucial.

Administrative supports. Hiring an adequate number of trained staff to assist claimants in a community-centric manner is essential to an effective implementation of a compensation regime. A well-staffed, culturally- and trauma-informed team of attendants would improve compensation processes. In addition, having support staff working directly with communities, such as community liaisons, can render compensation schemes more efficient and help tailor implementation to community needs.

Processing claims

Implement reasonable processing capacity. Multiple compensation processes have been more popular than anticipated, meaning high application volumes and overwhelmed staff, resulting in reduced capacity for claims administrators to process applicants in a timely manner. Claimants feel that this is tantamount to a broken promise, as they wait for months, and sometimes years, to receive a decision. For administrators, it means they begin processing applications at a disadvantage – there are too many applications and too few reviewers. Planning for the worst is important – meaning hiring more staff than needed, especially at the beginning of the notice plan, and leaving time to prepare between the compensation decision or agreement and the beginning of the notice plan.

Clearly communicate to manage internal and external expectations. Given repeated examples of long delays in processing applications, it is essential to set expectations with claimants on the length of time it will take to process applications. Further, government contractors and internal stakeholders must set reasonable timelines and have a clear-cut understanding of how the application process will function to ensure consistency in communication with claimants and administrative staff.

Build and test technological capacity. Technological processes have been inconsistently deployed. Claims administrators and users have failed to use the tools in the same way – even within the same organization. Higher-than-anticipated application volumes have slowed the efficacy of largely untested,

algorithmic tools. Claims administrators should test application processing tools prior to implementation and train users on ways to consistently adopt the software. Ultimately, technology is a useful tool, and it can lead to more efficacious and efficient processing of compensation.

Review of social science literature on retraumatization

Our review of social science literature on retraumatization expands on the findings of the review of past settlements by providing a deeper understanding of the psychological processes that need to be understood in designing compensation procedures that minimize the potential for additional harm. The following summarizes the key risk and protective factors for retraumatization in settlement, compensation and justice-seeking processes:

Factors that contribute to the risk of retraumatization:

- Requiring disclosure of traumatic experiences on multiple occasions
- Scaling compensation based on the established severity of abuses
- Adversarial approaches
- Procedural formalism and restrictions on the way in which a survivor tells their story
- Lengthy waiting periods
- Existing vulnerability related to racialization, marginalization, and lack of resources

Factors that protect against retraumatization:

- Adopting culturally relevant approaches to compensation and justice that may differ from Western legalistic traditions
- Availability of trauma-informed, culturally-sensitive support services before, during, and after, for participants and their families and communities
- Preparation for participation including explanation of procedures, timeline, requirements of participation, and possible costs/benefits of taking part
- Training all personnel involved in administration and adjudication in trauma- and cultural-sensitivity
- Considering compensation and justice at the individual, family, and community levels, and attending to cultural and structural factors that created conditions for abuse

Conclusions

A fair, transparent, equitable, and decolonized compensation process that is designed for claimants who have been systematically discriminated against by the Government of Canada is no doubt challenging given the limitations and lack of availability of administrative data. **Claimants are not responsible for missing and incomplete information about the discrimination that they suffered, and it is this fundamental acknowledgment that must guide the continued development of the compensation process.** The administrative body responsible for assessing eligibility should be comprised of experts in First Nations data governance, trauma, community relations, data, and most importantly the connection among all these principles. Elders will be integral to the compensation process as they hold crucial roles in supporting communities by teaching, advising, and counselling. Quality assurance processes must be documented and transparent to ensure that there is accountability for children, families, and communities whose trauma is ongoing. Jurisdictional disputes; racism and discrimination; a westernized approach which excludes Indigenous knowledge, culture, and practices; and the legacy of colonialism are the common foundation for the findings detailed in this report. For decades, the government of Canada has made decisions about the lives of First Nations children that it has failed to adequately document. This cannot be a deterrent to compensation.

Introduction

INTRODUCTION

Across Canada, generations of First Nations children have been denied the right to stay safely with their families and to receive adequate medical care or social services because of discriminatory policies and practices put in place by the federal government. While some past harms have been acknowledged through previous reconciliation efforts and compensation schemes,[1] these did not extend to the hundreds of thousands of First Nations children who have suffered from the inequitable provision of child welfare and essential health and social services over the past three decades.

The landmark compensation decision at the Canadian Human Rights Tribunal (CHRT) in September 2019 (*First Nations Child and Family Caring Society and Assembly of First Nations v. Attorney General of Canada*, 2019 [*2019 CHRT 39*]) attempts to redress these harms through compensation of claimants and reform of services. In parallel, two class action lawsuits (*Moushoom, Meawasige, Meawasige v. The Attorney General of Canada*, 2019; *Assembly of First Nations, Trout v. The Attorney General of Canada,* 2020) have sought compensation for an overlapping class of individuals. During the months of November and December 2021, interested parties related to the CHRT compensation decision (Attorney General of Canada, First Nations Child and Family Caring Society, Assembly of First Nations, Chiefs of Ontario, Nishnawbe Aski Nation, and Canadian Human Rights Commission) as well as associated class actions have engaged in confidential negotiations to determine the scope of eligibility and mechanisms for compensation. After over 14 years of legal battles, two **agreements-in-principle** (AIP) were reached among the parties on December 31, 2021. On January 4, 2022, basic details of the AIP were announced, indicating that the scope of eligibility will differ from the CHRT decision in certain important ways.

This report presents the findings of a project designed to provide background information to support the implementation of the *2019 CHRT 39* decision related to the availability and gaps in data that could help identify eligible individuals, and certain considerations related to the compensation process. The report is intended to serve as a technical document to support the implementation of a compensation process. Given the overlap between the CHRT order and the class actions, this report may also be helpful in supporting the implementation of the broader compensation process.

Project Scope

In 2020, a team of independent researchers from the University of Toronto and McGill University led by Professor Barbara Fallon and Professor Nico Trocmé was approached by Indigenous Services Canada (ISC), at the request of the First Nations Child and Family Caring Society (FNCFCS; "Caring Society"), to support the future operationalization of the *2019 CHRT 39* order. This request followed completion of the *Taxonomy of Compensation Categories for First Nations Children, Youth and Families related to 2019 CHRT 39* (Sistovaris et al., 2019), which was written in 2019 under the leadership of Professor Barbara Fallon at the University of Toronto. The present project began in **October 2020** and concludes with the submission of this report in **January 2022**.

This project was initiated in an effort to minimize the burden on individual claimants to prove their eligibility, as was initially intended by the CHRT decision. The project team was asked to support the future implementation of the decision through two main tasks:

1. Review the **availability and gaps in data** that could help identify potentially eligible claimants under the *2019 CHRT 39* decision, and
2. Provide certain **considerations for the compensation process**, including the **notice plan**, for applicants to receive compensation under this decision.

To review **availability of data**, we: 1) identified information of interest that may help prove claimant eligibility under the CHRT compensation categories; 2) identified administrative data sources that collected this information; and 3) asked key respondents with in-depth knowledge of these data systems to provide information on the quality of the data. We started with data from administrative systems at ISC (First Nations Child and Family Services [FNCFS]; Jordan's Principle; Non-Insured Health Benefits [NIHB] programs; and First Nations and Inuit Health Branch [FNIHB] programs). For additional child welfare data, we reached out to a sample of First Nations and non-First Nations child welfare agencies in jurisdictions across Canada. For additional Jordan's Principle information, we spoke with Jordan's Principle service coordination organizations, and explored potentially relevant administrative and survey data sources. We highlighted potential gaps in available data along with

1 Including: Indian Residential Schools Settlement Agreement (IRSSA), Federal (Day) School Settlement, and Sixties Scoop Settlement

concerns raised by the people we spoke to. At no point in the process did we review actual datasets, whether anonymized or not. We relied upon secondary descriptive information, such as respondents' statements and data dictionaries, to complete our review of available data. Given that our review of child welfare agency information systems and Jordan's Principle information was limited to only a few selected agencies, the findings included in this report cannot be generalized to all of Canada but provide a sense of a range of data collection and storage practices. The research process was also limited by each agency or organization's ability to provide the information requested.

To provide **considerations for the compensation process**, including the notice plan, we conducted research on prior compensation processes to highlight lessons learned that may inform the upcoming compensation implementation. To complement our research on past settlement processes, we conducted a review of literature related to the notion of retraumatization with a focus on reconciliation and justice-seeking processes. We also consolidated process-related concerns from respondents we spoke to throughout the project. It is important to note that our documentation of respondent concerns reflects an ad hoc process emerging from our discussions with key contacts regarding data availability. The respondents contacted for this process were individuals either in leadership or management positions, or were familiar with collection, documentation, and storage of data related to child welfare services, Jordan's Principle, or other ISC programs. Our mandate did not include a systematic review of existing concerns among other individuals who will be implicated in the compensation process – namely, individual claimants themselves. Therefore, the concerns noted in this report in no way reflect the extent of concerns that may be held regarding the compensation process.

Contextual research throughout the project helped ground tasks related to our dual mandate. We conducted research related to child welfare data quality, data expungement practices, First Nations child health and social services, and First Nations data governance. We also monitored legal developments related to the *2019 CHRT 39* decision during the project, most notably the week of hearings during the judicial review of the decision at the federal court (held June 14–18, 2021), and followed the class action settlement processes taking place in tandem with the CHRT decision, up until the agreements in principle were reached.

At different stages of the project, the team engaged in discussions with various **stakeholders**, including: the First Nations Child and Family Caring Society, the Assembly of First Nations, the National Advisory Committee on First Nations Child and Family Services (NAC), Indigenous Services Canada, and First Nations experts in child welfare and Jordan's Principle in each province/territory. A small working group emerged from our discussions with NAC, with whom we held in-depth consultations at each project phase.

Legal Context: Timeline

The project took place within a rapidly shifting context, following a series of developments that have led to efforts to seek justice based on the *2016 CHRT 2* Merit Decision, such as *2019 CHRT 39*. The following timeline provides information on key moments that relate to *2019 CHRT 39:*

February 23, 2007	Complaint of discrimination filed at the Canadian Human Rights Commission (CHRC) by the First Nations Child and Family Caring Society (FNCFCS) and the Assembly of First Nations (AFN) alleging discriminatory funding of child welfare and children's services on-reserve.
January 26, 2016	***2016 CHRT 2* (the "Merit Decision"):** The Canadian Human Rights Tribunal (CHRT; "the Tribunal") substantiates the 2007 complaint, finding systemic discrimination on the part of the government of Canada against First Nations children and their families in the provision of First Nations Child and Family Services and in its "narrow and inadequate" (paragraph 107) implementation of Jordan's Principle. This was followed by a series of non-compliance orders related to findings of ongoing discrimination.
May 26, 2017	***2017 CHRT 14*:** The Tribunal finds that Canada's implementation of Jordan's Principle was overly narrow in only including children on reserve or ordinarily resident on reserve (paragraphs 50, 52–54, 67). The Panel confirms that Jordan's Principle "applies equally to all First Nations children, whether resident on or off reserve" (paragraph 135, 1.B.i.).
November 2, 2017	***2017 CHRT 35*:** The federal government is found to be in compliance with Jordan's Principle.

March 4, 2019

Moushoom, Meawasige, Meawasige v. The Attorney General of Canada class action lawsuit filed to seek relief from damages related to the removal of children under the FNCFS program which incentivized these removals and poor implementation of Jordan's Principle. The class period for this lawsuit was April 1, 1991, to March 1, 2019.

September 6, 2019

***2019 CHRT 39* (the "Compensation Decision"):** The Tribunal releases the eighth non-compliance motion, which ordered Canada to compensate First Nations children and their caregivers who have been discriminated against through the inequitable provision of child welfare (between 2006 to present) and Jordan's Principle services (between 2007 and 2017).

Autumn 2019

An iteration of the current project team is asked by the First Nations Child and Family Caring Society ("Caring Society") to create a detailed *Taxonomy of Compensation Categories for First Nations Children, Youth and Families related to 2019 CHRT 39* (Sistovaris et al., 2019; "the Taxonomy").

October 7, 2019

The government of Canada files for judicial review of ***2019 CHRT 39*** at the Federal Court.

January 28, 2020

Assembly of First Nations, Trout v. The Attorney General of Canada class action lawsuit filed to seek relief from damages related to funding gaps resulting in denials, delays, disruptions, and gaps in health and social services to First Nations children. The class period for this lawsuit was April 1, 1991, to December 11, 2017.

April 16, 2020

***2020 CHRT 7*:** The tribunal determines that eligible claimants should obtain access to compensation funds at the age of majority of the province/territory. Tribunal ruled that children apprehended prior to January 1, 2006, who are still in care past that date are eligible for compensation and that compensation should be paid to the estates of deceased individuals who would otherwise be eligible.

May 28, 2020

***2020 CHRT 15*:** Tribunal provides additional information on the terms essential service, service gap, and unreasonable delay for the purposes of compensation, which have since been reflected in the *Compensation Framework*.

November 25, 2020

***2020 CHRT 36*:** Tribunal adopts a definition of First Nations children for the purposes of Jordan's Principle that includes children who had one parent/guardian who is registered or eligible to be registered under the *Indian Act*, were recognized by their Nation/community, or were ordinarily resident on reserve, which were subsequently incorporated in the *Compensation Framework*.

February 12, 2021

2021 CHRT 7*:** The Tribunal approves a final ***Framework for the Payment of Compensation under 2019 CHRT 39, a document based on discussions among the parties to the Compensation Decision. The Framework outlines in more granular detail than the Compensation Decision some principles and practicalities to inform the implementation of compensation through *2019 CHRT 39*. It includes the *Taxonomy* as a guide to help identify eligible claimants.[2]

June 14–18, 2021

Hearings for the judicial review of *2019 CHRT 39* are held at the federal court between June 14 and June 18, 2021.

September 29, 2021

The federal court dismisses the judicial review and upholds the *2019 CHRT 39* order.

October 29, 2021

The government of Canada files an appeal of the judicial review decision.

December 31, 2021

After confidential mediation among the government, parties to the *Compensation Decision*, and the class action counsel, AIPs were reached, which would result in approximately $20 billion being directed towards the compensation of First Nations children and families and $20 billion being directed towards the reform of the FNCFS program.

2 The definitions from the final version of the Framework are used in this report.

The following sections outline the understanding of eligibility for compensation that informed our research from October 2020 to December 2021, based on the *2019 CHRT 39* decision. Given that the recent AIPs indicate that compensation mechanisms will differ from the scope of eligibility on *2019 CHRT 39* in important ways, where possible we have attempted to include information gleaned from our research that could remain relevant for the eventual settlement agreement, which will be decided after this report is finalized and submitted.

Compensation Categories

This section provides an overview of the understanding of the *2019 CHRT 39* compensation categories upon which we based our approach, before highlighting certain differences between the CHRT compensation categories and the settlement agreement currently being negotiated.

2019 CHRT 39 compensation categories

Pursuant to the *2019 CHRT 39* compensation order, maximum allowable compensation ($40,000) was due to First Nations children and their caregivers who were eligible for compensation. Four main compensation categories could be extrapolated from the *2019 CHRT 39* ruling in paragraphs 245–257. Each compensation category is described in Table 2.[3]

Table 2. Description of compensation categories under *2019 CHRT 39*

Child welfare	**First Nations children** living on reserve or in the Yukon who were removed by the child welfare system and *placed* outside of their home, family, and community.	From January 1, 2006[4] until further notice[5]
	First Nations parents or grandparents who were the **primary caregiver** of a child removed **unnecessarily** from their home, family, and community; unless the parent or grandparent *physically*, *sexually*, or *psychologically abused* the child.	
Child welfare/ Jordan's Principle	**First Nations children** living on or off-reserve and their parents or grandparents in cases of the removal of a child to obtain **essential services** covered under Jordan's Principle as defined in 2017 CHRT 14 and 35.	From December 12, 2007[6] to November 2, 2017[7]
Jordan's Principle	First Nations children living on or off-reserve and their parents or grandparents who experienced a **gap**, **denial** or **delay** of **essential services** covered under Jordan's Principle as defined in 2017 CHRT 14 and 35.	

** Concepts in bold are defined further in the Final Compensation Framework (see Table 3) and those in italics are defined by province/territory in the Taxonomy (see Appendix A).*

3 Given subsequent orders regarding definitions used in the Compensation Decision, there have been changes in the interpretation of the CHRT compensation categories since the release of the Taxonomy report. The current report provides a more up-to-date understanding of these categories.
4 Date following the last WEN DE report
5 Earliest of – either (1) Panel decides that unnecessary removal of FN children has ceased; (2) Parties agreed on a settlement agreement for long-term relief; or (3) Panel ceases to retain jurisdiction and amends the order.
6 Date of adoption in the House of Commons of the Jordan's Principle motion (see: Canada. Parliament, House of Commons, Journals, 39th Parliament, 2nd sess., 2007 December 12, Number 036).
7 Date of Tribunal's 2017 CHRT 35 ruling on Jordan's Principle (see: *First Nations Child & Family Caring Society of Canada et al. v. Attorney General of Canada* (Representing the Minister of Indigenous and Northern Affairs Canada), 2017 CHRT 35).

Definitions provided in the Final Compensation Framework

On February 12 2021, the Tribunal approved the final ***Framework for the Payment of Compensation under 2019 CHRT 39*** ("the *Final Compensation Framework*"), which was "intended to facilitate and expedite the payment of compensation to the beneficiaries described in the *Compensation Entitlement Order*, as amended by subsequent Tribunal decisions" (*Final Compensation Framework*, s.1.3). It was prepared following discussions between the respondent (Attorney General of Canada) and the complainants (Assembly of First Nations, First Nations Child and Family Society) with input from the Canadian Human Rights Commission, Chiefs of Ontario, and Nishnawbe Aski Nation.

The document includes definitions of certain terms used in the compensation order following discussions between the Attorney General of Canada, the First Nations Child and Family Caring Society (FNCFS), the Assembly of First Nations (AFN) and the interested parties Chiefs of Ontario (COO) and Nishnawbe Aski Nation (NAN). These definitions are listed in Table 3 below.

In addition to the definitions described above, the *Final Compensation Framework* provides guiding principles as well as specific considerations for the compensation process related to: the location of beneficiaries, support to beneficiaries, validation of compensation claims, processing of compensation claims, supports for beneficiaries relating to the payment of compensation, and monitoring of the framework. These process-related components of the *Final Compensation Framework* are summarized in Appendix B.

Table 3. Definitions provided in the *Final Compensation Framework*

Term	Definition provided in the *Final Compensation Framework*
Beneficiary	"a person, living or deceased, described at paragraphs 245–257 of the Compensation Entitlement Order,2 as expanded by the Tribunal's decision in 2020 CHRT 7" (*Final Compensation Framework*, s. 4.1).[8]
First Nations child	"a child who: a) was registered or eligible to be registered under the Indian Act; b) had one parent/guardian who is registered or eligible to be registered under the Indian Act; c) was recognized by their Nation for the purposes of Jordan's Principle; or d) was ordinarily resident on reserve, or in a community with a self-government agreement" "if they had a **meaningful** *connection* to the First Nations community. The factors to be considered and carefully balanced include (without any single factor being determinative): a) Whether the child was born in a First Nations community or whose parents were residing in a First Nations community at the time of birth; b) How long the child has lived in a First Nations community; c) Whether the child's residence in a First Nations community was continuous; d) Whether the child was eligible to receive services and supports from the First Nation community while residing there (e.g. school, health services, social housing, bearing in mind that there may have been inadequate or non-existent services in the First Nations community at the time); and e) The extent of the connection of the child's parents and/or other caregivers to the First Nation community, excluding those non-status individuals working on a reserve (i.e., RCMP, teachers, medical professionals, and social workers)" (*Final Compensation Framework*, s. 4.2.5, emphasis added) First Nations children who were not registered or eligible to be registered under the Indian Act (i.e., categories b to d) "are eligible for compensation in relation to denials, gaps and unreasonable delays with respect to essential services [from] **January 26, 2016 to November 2, 2017**." (*Final Compensation Framework*, p. s. 4.2.5.2, emphasis added). They are only "eligible for compensation in the amount of $20,000 for pain and suffering […] but are not eligible for compensation under s. 53(3) of the Canadian Human Rights Act for wilful and reckless discrimination" (*Final Compensation Framework*, s. 4.2.5.3)

(continued on following page)

8 In this report, we typically use the term "claimant" to refer to individuals who may apply for compensation. Particularly given the remaining ambiguities and uncertainties regarding eligibility and implementation, the term "claimant" refers more generally to any individual who may be eligible or may apply for compensation.

Table 3. Definitions provided in the *Final Compensation Framework (continued)*

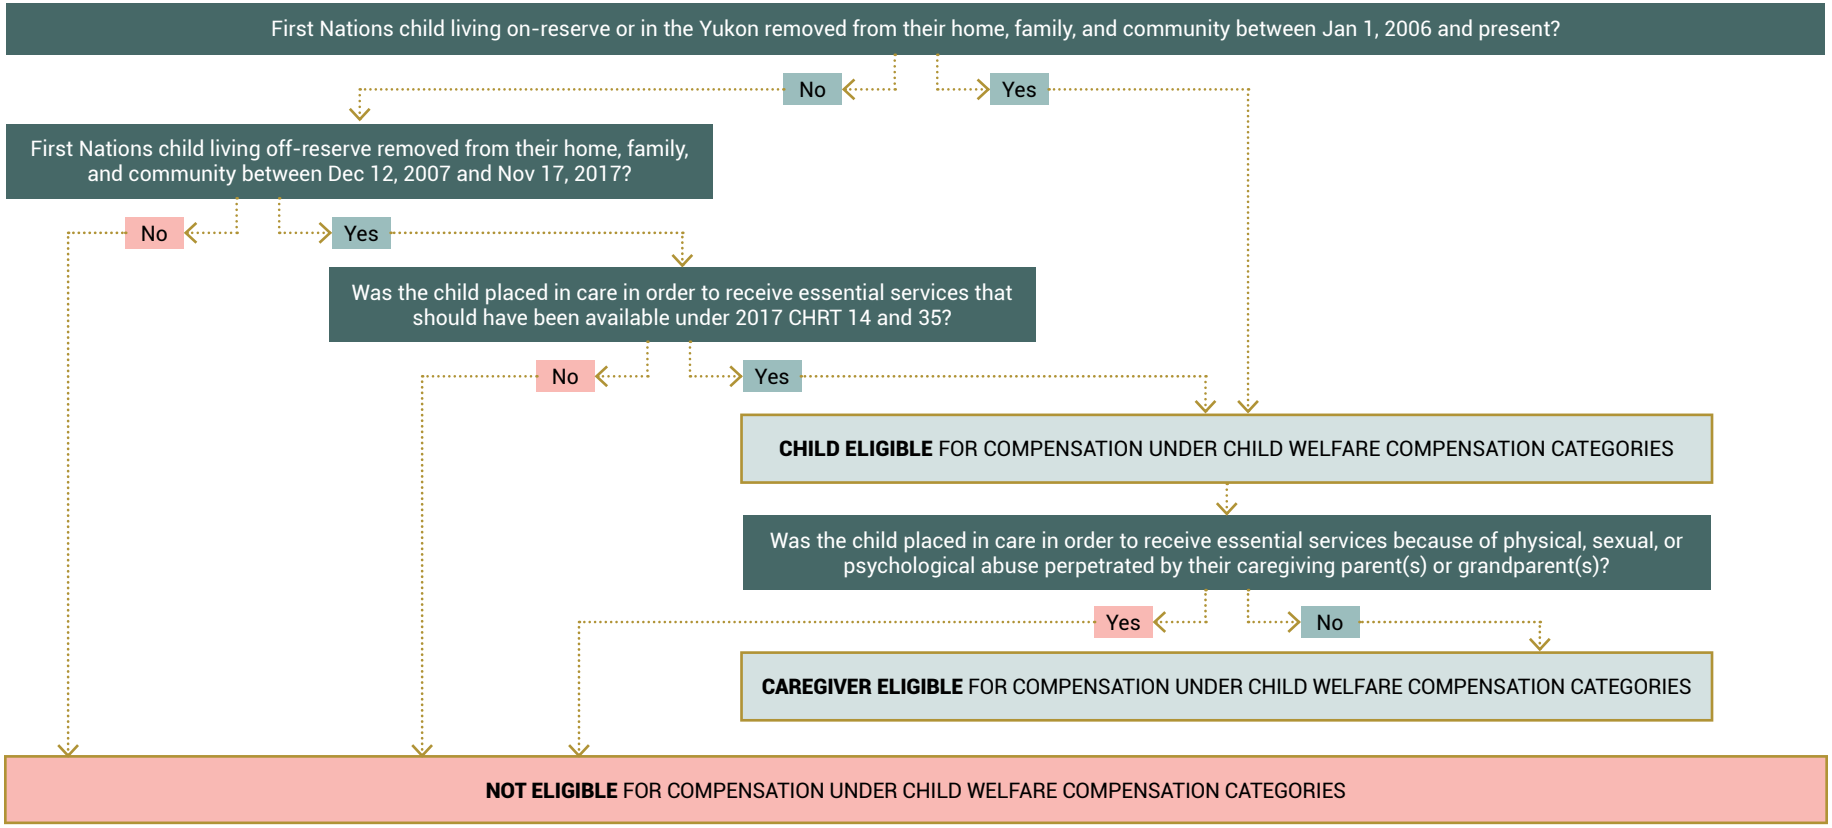
Term	Definition provided in the *Final Compensation Framework*
Necessary/ unnecessary removal	"includes: a) children removed from their families and placed in alternative care pursuant to provincial/territorial child and family services legislation, including, but not limited to, kinship and various custody agreements entered into between authorized child and family services officials and the parent(s) or caregiving grandparent(s); b) children removed due to substantiated maltreatment and substantiated risks for maltreatment; and c) children removed prior to January 1, 2006, but who were in care as of that date." (*Final Compensation Framework*, s. 4.2.1)
Essential service	"a support, product and/or service **recommended by a professional** that was **reasonably necessary** to ensure: a) substantive equality in the provision of services, products and/or supports to the child (accounting for historical disadvantage, geographic circumstances, and the need for culturally appropriate services, products and/or supports); and b) the best interests and safety of the child" (*Final Compensation Framework*, s. 4.2.2) **Recommended by a professional:** "must be interpreted in a manner such that a claimant's inability to provide proof of assessment, referral or recommendation contemporaneous with the necessity of support, product and/or service will not automatically disentitle the individual from eligibility for compensation. For example, particularly in remote communities there may not have been timely access to specialists, but there may have been access to community health nurses, social support workers, mental health workers. However, these individuals may not have designations in a specific profession related to the service being recommended. In these situations, flexibility is necessary to ensure that First Nations children who were unable to access an assessment, referral or recommendation in a timely manner due to systemic barriers (e.g. lack of approval to travel, long wait time prior to physician, therapist or specialist visits in community) are not unfairly excluded from compensation eligibility. Further guidance on this matter will be included in the Guide referenced at s. 2.5." (*Final Compensation Framework*, s. 4.2.2.2) **Reasonably necessary:** "the failure to provide the support, product or service could have: a) caused the child to experience mental or physical pain or suffering; or b) widened the gap in health outcomes between the First Nations child and children in the rest of Canadian society." (*Final Compensation Framework*, s. 4.2.2.1)
Service gap	"a situation where there was a service, and/or product and/or support based on the child's confirmed need that: a) was necessary to ensure substantive equality in the provision of services, products and/or supports to the child; b) 1. was recommended by a professional with expertise directly related to the child's need(s). Documentation provided by a medical professional or other registered professional is conclusive, unless Canada can demonstrate to the satisfaction of the Central Administrator that, based on clinical evidence available at the time, the potential risk to the child of the service, product and/or support outweighed the potential benefit; or 2. an Elder or Knowledge Keeper, who is recognized by the child's specific First Nations community, recommends a linguistic or cultural product, support and/or service; and c) the child's needs were not met." (*Final Compensation Framework*, s. 4.2.3)
Unreasonable delay	"where a request was not determined within 12 hours for an urgent case, or 48 hours for other cases. In exceptional cases and subject to a high threshold, Canada may rebut the presumption of unreasonable delay in any given case with reference to the following list of contextual factors, none of which is exclusively determinative: a) the nature of the product, support and/or service sought; b) the reason for the delay; c) the potential for the delay to adversely impact the child's needs, as informed by the principle of substantive equality; d) whether the child's need was addressed by a different service, product and/or support of equal or greater quality, duration and quantity, otherwise provided in a reasonable time; e) the normative standards for providing the support, product and/or services in force in the province or territory in which the child resided, or received the service, at the time of the child's need." (*Final Compensation Framework*, s. 4.2.4)

Operationalization of the *2019 CHRT 39* compensation categories

The following decision trees reflect our understanding of how eligibility under *2019 CHRT 39* could be operationalized.[9] They are based on paragraphs 245–257 of the Compensation order and the definitions provided in the *Final Compensation Framework*, which were listed above.

Child welfare compensation categories

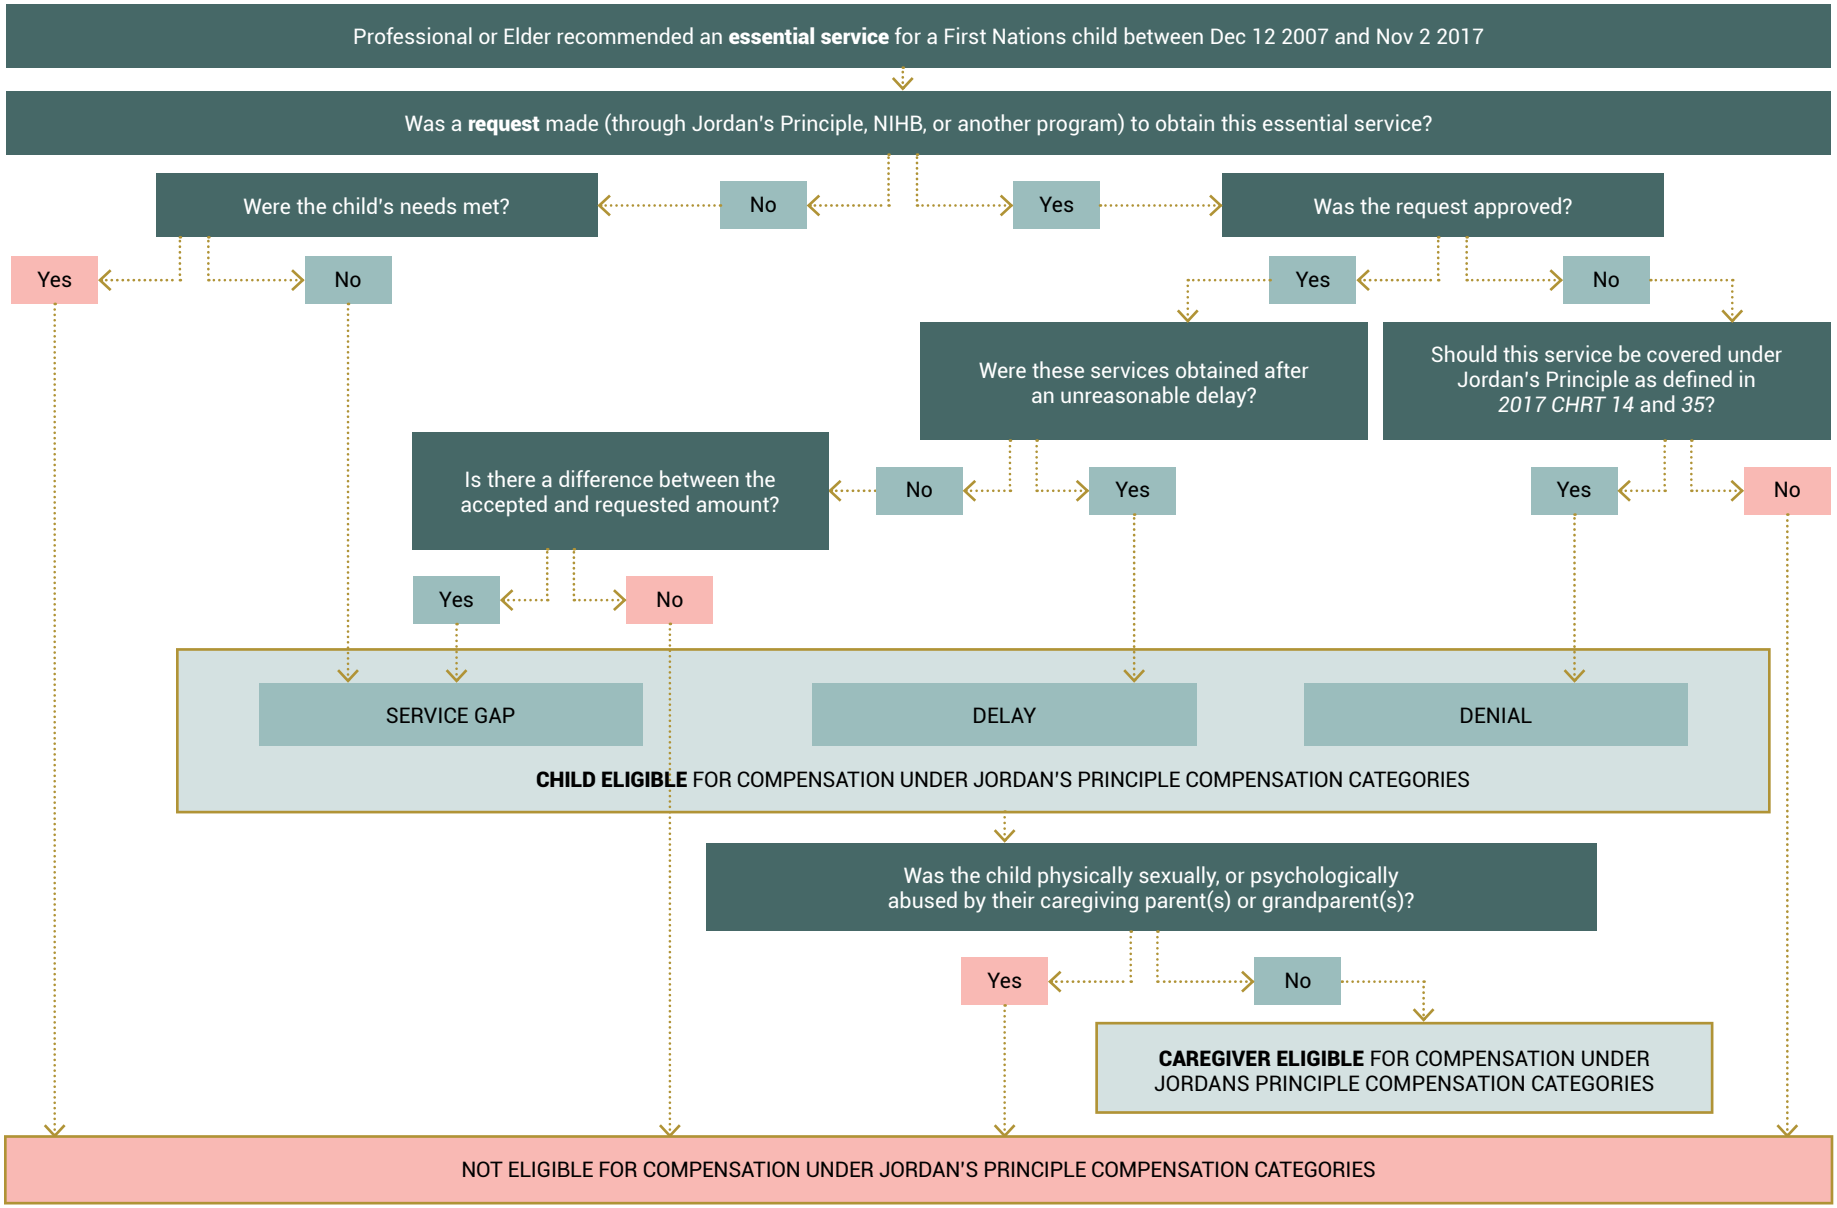
Figure 1. Decision tree presenting project team understanding of the *2019 CHRT 39* child welfare compensation categories



9 Given the expected shift in the timeframe of eligibility to extend to 1991, dates herein would need to be adjusted, but we opted to include this diagram as the structure of a similar decision tree may still be useful for the settlement agreement.

Jordan's Principle compensation categories

Figure 2. Decision tree presenting project team understanding of the *2019 CHRT 39* Jordan's Principle compensation categories



Potential differences between the negotiated settlement and the CHRT order

The section below highlights potential differences between the December 31, 2021, AIP and the CHRT order, as well as remaining ambiguities.

Timeframe of eligibility. The information currently available on the AIP reached by the parties suggests that the timeframe for eligibility for the Removed Child class goes from April 1, 1991, to March 31, 2022, whilst the timeframe of eligibility for the Jordan's Principle class goes from April 1, 1991, to November 2, 2017.[10] This extends the timeframe of eligibility originally granted under *2019 CHRT 39*. Given that the project mandate was tied to the CHRT order, the outreach conducted by the team focused on data available from January 2006 to present for the child welfare compensation categories and from December 2007 to November 2017 for the Jordan's Principle compensation categories.

Eligibility under the Removed Child class. The current information available on the negotiated settlement suggests that the Removed Child class includes children who "were taken in out-of-home care."[11] At the date of writing the report (January 2022), it is unclear whether out-of-home care only includes formal out-of-home care arrangements (i.e., excludes informal kinship services) and whether out-of-home care includes placement with extended family and placement within the community. The Sotos website also suggests that "length of time in care; number of out-of-home placements, and [placement] in care on or off reserve" could be used to determine the final compensation amount. These factors were not included in the *2019 CHRT 39* order. As a result, the project team did not specifically ask about these concepts when reaching out to respondents. We have information on certain proxies, however, which could be helpful in understanding the availability of this information.

Eligibility under the Jordan's Principle class. The current information available on the negotiated settlement states that the Jordan's Principle class includes children who "experienced delays or denials of a public service or product contrary to Jordan's Principle."[12] This does not specify whether this class would also include denied or delayed group requests for public services or products and would suggest that the Jordan's Principle class does not include children who experienced service gaps, but made no requests for services. As a result of this, the review of Jordan's Principle data availability below focuses primarily on denials and delays.

Primary caregivers. As of yet, publicly available information does not specify which primary caregivers would be compensated. As such, it is not yet possible to confirm whether primary caregivers who physically, sexually, or emotionally abused their children are excluded.

Structure of the Report

This report comprises detailed descriptive findings regarding the availability of data related to the *2019 CHRT 39* order and considerations for the notice plan. The report is structured in three sections: **(I)** an overview of the structure of health and social services and child welfare services for First Nations children in Canada, and a review of the opportunities and limitations of relying on administrative data to inform decisions; **(II)** an overview of our approach and findings related to the availability of data following our review; and **(III)** documentation of process-related concerns from respondents, a review of lessons learned from past Canadian and international settlement processes, and literature on retraumatization

I. The Delivery and Documentation of Services to First Nations Children

Growing recognition of the discrimination faced by First Nations children in Canada has elicited numerous calls for action to address the trauma inflicted on generations of First Nations families by a system firmly rooted in colonialism and government policies of assimilation. Recent public processes have highlighted inequities in child welfare and public services for First Nations children. These developments in the public sphere have taken place in numerous realms, the Canadian Human Rights Commission being just one of many. In 2015, the Truth and Reconciliation Commission (TRC) process produced a list of 94 "Calls to Action," the first of which related to addressing the high level of involvement of First Nations children in child welfare systems (TRC, 2015a). The TRC report also called for full implementation of Jordan's Principle[1] and increased access to health, educational, and culturally relevant services (TRC, 2015a). Related to these developments, there have been many calls for better documentation and data to monitor these inequitable patterns in service delivery (e.g., Sinha et al., 2021). This section provides an overview of service delivery and challenges related to the use of *administrative data to document access to services*.

The Delivery of Services to First Nations Children in Canada

Marina Sistovaris & CHRT Compensation Project Team

Current structure of First Nations child welfare in Canada

Legal framework for the provision of child welfare services across Canada

Child welfare in Canada is administered at the federal, provincial, territorial, and band level, resulting in a complex web of policies, structures and services that vary across these jurisdictions. First Nations children involved with child welfare are subject to different child welfare mandates and funding based on their place of residence. First Nations children ordinarily resident on-reserve may interact with a locally run First Nations child welfare agency or one run by the province, while First Nations children living off-reserve who come in contact with child welfare are likely to interact with the provincial designate that serves the area where they live. A small number of urban Indigenous child and family services agencies serve First Nations children off-reserve in urban settings.

Canada's child welfare system consists of over 400 child welfare agencies, operating both federally and under the jurisdiction of 13 provinces and territories (Trocmé et al., 2010). In 2016, the First Nations Child and Family Caring Society of Canada estimated that there were over 140 First Nations agencies delivering services to First Nations peoples and eight Métis agencies delivering culturally relevant services to Métis families (National Collaborating Centre for Aboriginal Health, 2017; Sinha & Kozlowski, 2013). Indigenous child welfare agencies typically sign agreements with either the federal or provincial governments – or both governments – authorizing them to provide a range of child protection services to Indigenous children (Canadian Child Welfare Research Portal, 2019; Bennett, n.d.; Sinha & Kozlowski, 2013). In addition to the complex web of child welfare policies, structures, and services that vary across jurisdictions, variations in child welfare practice are also found within jurisdictions.

Until recently, both First Nations and mainstream agencies had to apply the **child welfare legislation** of their province or territory when providing services to families. In Canada, most provinces and territories have incorporated provisions within their child welfare legislation for Indigenous children, families and communities, such as: band notification of court or placement; Indigenous involvement in case management; Indigenous involvement in service planning or delivery; prioritization of kinship care; submission of cultural connection plan; and connection to Indigenous culture in the best interest of the child (Sinha & Kozlowski, 2013). On January 1, 2020, *An Act Respecting First Nations, Inuit and Métis Children, Youth and Families* came into force, allowing Indigenous communities to have control over child and family services.[2] Although the *Act* is the first to recognize Indigenous jurisdiction over child welfare, the law has been critiqued because of its lack of commitment to core funding and the limits

1 Jordan's Principle is a "child-first" principle, adopted in 2007, designed to ensure that First Nations children do not experience delays, disruptions, or denials of services typically available to other Canadian children, including, but not limited to services such as mental health, special education, dental, physical therapy, speech therapy, medical equipment and physiotherapy (Canadian Pediatric Society, 2019; Government of Canada, 2019).

2 For a detailed discussion of the *2020 Act*, see Indigenous Services Canada (2020a).

it imposes on Indigenous jurisdiction (e.g., Metallic, Friedland, & Morales, 2019). In July 2020, the first coordination agreement under the *Act* was signed by the Cowessess First Nation with Government of Canada and the Government of Saskatchewan, focusing on prevention, and ensuring that families are provided with the necessary resources to heal from intergenerational trauma (Indigenous Services Canada, 2022, n.p.).

While the legislative mandate for child welfare has rested with provinces and territories, **funding** for child welfare services for First Nations families living on-reserve lies with the federal government, through the First Nations Child and Family Services (FNCFS) program at Indigenous Services Canada.

Funding for children living off-reserve lies with the province/territory. In fiscal year 2018-2019, there were 153 FNCFS-funded bodies in Canada, including both delegated First Nations agencies (105 agencies) and provincial ministries serving First Nations communities (see Appendix D and Appendix E for a list of agencies funded by the FNCFS program and the First Nations bands associated with them since 2013-2014). Table 1.1 below outlines the administrative responsibility and the number of First Nations delegated child welfare agencies in Canadian provinces and territories.

Table 1.1 Administrative responsibility and child welfare service delivery in Canadian provinces and territories (FY 2018-2019)

Jurisdiction	Child Welfare Legislation	Ministry responsible for child welfare	No. of delegated agencies receiving FNCFS-funding*
Alberta	*Child, Youth and Family Enhancement Act*	Ministry of Children's Services	17
British Columbia	*Child, Family and Community Service Act; The Adoption Act; The Infants Act; Representative for Children and Youth Act*	**Ministry of Children & Family Development** Director of Child Protection	18
Manitoba	*The Child and Family Services Act; The Child and Family Services Authorities Act*	**Department of Families** Child and Family Services	15
New Brunswick	*Family Services Act; Intercountry Adoption Act*	Ministry of Social Development	7
Newfoundland & Labrador	*Children, Youth and Families Act; An Act Respecting Adoptions*	**Department of Health & Community Services** Department of Children, Seniors and Social Development	1
Northwest Territories	*Child and Family Services Act*	**Department of Health & Social Services** Child and Family Services	0
Nova Scotia	*Children and Family Services Act*	**Department of Community Services** Division of Child, Youth and Family Supports	1
Ontario	*Child, Youth and Family Services Act*	Ministry of Children, Community and Social Services	13
Prince Edward Island	*Child Protection Act; Adoption Act*	**Ministry of Family and Human Services** Department of Child and Family Services	1
Quebec	*Youth Protection Act; An Act Respecting Health and Social Services*	**Ministry of Health and Social Services** Directors of Youth Protection	15
Saskatchewan	*Child and Family Services Act; The Child and Family Services Amendment Act*	Ministry of Social Services	17
Yukon	*Child and Family Services Act; Children's Law Act*	**Department of Health and Social Services** Family and Children's Services	0

** Number of FNCFS-funded delegated agencies as of as of March 31, 2019, according to information provided by ISC (Appendix D)*

Evidence of ongoing patterns of overrepresentation in the child welfare system

Ongoing patterns of First Nations overrepresentation in child welfare systems are consistently documented in both national and provincial data (Fallon et al., 2021; Sinha et al., 2011). According to the First Nations/Canadian Incidence Study of Reported Child Abuse and Neglect (FN/CIS-2019), in 2019, investigations involving First Nations children were 17.2 times as likely to result in placement in formal out-of-home care compared to investigations involving non-Indigenous children (Fallon et al., 2021).[3] Child welfare involvement is consistently shown to be overwhelmingly related to neglect cases which are often driven by poverty, inadequate housing, and other inequities disproportionately experienced by First Nations families in Canada (First Nations Child and Family Caring Society, 2013; Trocmé, Knoke, & Blackstock, 2004).

Census data estimate that a total of 28,030 children aged 0 to 14 were placed in foster care across Canada on a given day in 2016 (Saint-Girons, Trocmé, Esposito, & Fallon, 2020, p. 1).[4] Considered to be among Canada's most vulnerable populations, children in care either have no parents or for complex and interrelated reasons – socioeconomic circumstances, behavioural issues, abuse, family conflict, neglect or a lack of parental abilities – are removed from their parents by the child welfare system or courts (Sherlock & Culbert, 2015; Esposito et al., 2013). Once children enter care, they are often confronted with numerous challenges as they navigate child welfare and other systems. According to child welfare advocates, most children in care are "resilient and determined to survive on their own. But while some find varying degrees of success, others fall down" (Sherlock & Culbert, 2015).

A closer examination of child welfare in Canada reveals the systemic disadvantages faced by First Nations, Inuit, and Métis children in care. First, relative to Canada's population, a disproportionate number of Indigenous[5] children experience removal from their home under child welfare systems (Fallon et al., 2021; Mosher & Hewitt, 2018; Ontario Human Rights Commission, 2018; Fallon et al., 2016; Residential Services Review Panel, 2016; Turner, 2016; Contenta, Monsebraaten & Rankin, 2015, 2014; Peel Children's Aid Society's Annual Report, 2013; United Nations Committee on the Rights of the Child, 2012; McMurtry & Curling, 2008). The results of the 2016 Census show that Indigenous children under the age of 15 represent only eight percent of Canada's total child population, but account for 52 percent of the total foster child population (Statistics Canada, 2016). The percentage of Indigenous children in out-of-home care in some provinces and territories has been shown to be much higher. In Manitoba, for example, almost 90 percent of children in care were Indigenous in October 2017 (Government of Manitoba, 2018).

The situation is exacerbated by the fact that, in many cases, once in foster care, Indigenous children remain in care longer (often remaining in permanent care) and are less likely to be returned to their families compared to their non-Indigenous counterparts (Office of the Child and Youth Advocate Alberta, 2016; McKenzie et al., 2009). Although there has been some success in placing Indigenous children within their own community with extended family, a family with shared ethno-cultural background or foster care that is connected to the family unit, the majority of Indigenous children continue to be placed in non-Indigenous care settings (McKenzie et al., 2009). Second, the rate of Indigenous overrepresentation in foster care continues to grow each year as First Nations, Métis, and Inuit children are brought into care of the welfare system at an increasing rate (Mosher & Hewitt, 2018; Fallon et al., 2016; Statistics Canada, 2016). Third, the over-representation of Indigenous children occurs at every phase of child welfare intervention from reports, investigation, substantiation, entry into care, and placement in permanent child welfare care (das McMurtry, 2015; Blackstock, 2007; Fallon et al., 2021; Sinha et al., 2011; Trocmé et al., 2005).

3 Please refer to Appendix C for an overview of the FN/CIS-2019 study and an analysis of investigations involving First Nations children living on-reserve.

4 There are several important caveats to keep in mind with Census data: 1) Children living in kinship foster homes could be undercounted, since they could be categorized as a "Grandchild" or as an "Other relationship" (such a niece or nephew), rather than as a "Foster child"; 2) Children and youth living in congregate settings (e.g. group homes or other residential settings) are not included in the Census; 3) The Census count is a cross-sectional (point-in-time) count that does not provide information about the total number of children placed in foster care during the year.

5 Indigenous peoples of Canada include those who identify as First Nations (North American Indian), Métis and/or Inuk (Inuit), and/or those who report being Registered or Treaty Indians (that is, registered under the Indian Act of Canada), and/or those who have membership in a First Nation or Indian band (Statistics Canada, 2021a). Although the term Indigenous is used as a collective term for all Indigenous peoples and identities, it is important to note that Indigenous peoples are not a homogeneous group. Indigenous peoples of Canada are a diverse population with distinct histories, languages, cultural practices and spiritual beliefs (Crown-Indigenous Relations and Northern Affairs Canada, 2021; Voyageur & Calliou, 2000; Charron, 2019).

The staggering number of Indigenous children in care has been identified as a growing humanitarian crisis (Hyslop, 2018; Truth and Reconciliation Commission of Canada, 2015a, 2015b, 2015c; Ontario Human Rights Commission, 2018; Johnston, 2016, 1983, 1981). According to child welfare advocates, the overrepresentation of First Nations children in Canada's child welfare system "has increased to the point that the number of First Nations children placed in state care today is three times that at the height of residential school operations" (National Collaborating Centre For Aboriginal Health, 2013, n.p.; Blackstock, 2016, 2007, 2003; Ontario Human Rights Commission, 2018). In recent years, the utilization of data as a decision-making tool in the field of child welfare has taken on greater urgency in Canada considering the alarming number of children that continue to enter child welfare systems (Fallon et. al, 2021; Statistics Canada, 2016; Brownell et al., 2015, p. ix; das McMurtry, 2015).

Numerous calls to address inequities in child welfare services

Evidence of the disproportionate rate of Indigenous children in foster care and continued underfunding of services on reserves has fuelled arguments that Canada's child welfare system has become the modern-day residential school system (Somos, 2021; Wright, 2021).

Patterns of forcible removal of children and damaging dynamics between the federal government and First Nations communities have been documented over three centuries. At every point, Canada was called to make changes, but these demands were not implemented in time, leading to growing crisis that is being seen today.

In **1895**, Duncan Campbell Scott – one of Canada's leading bureaucrats responsible for the residential school file and often identified as the architect of Canada's residential school system (Wattam, 2016, p. 3; Blackstock, 2016, n.p.) – began allowing for the forced removal of "Indian" children from their families and communities for "education" or because they were "not properly cared for" (Blackstock, 2016, n.p.).

By **1953**, there was a growing body of evidence proving that Canada's residential schools had become child welfare institutions (Blackstock, 2016, n.p.).[6]

In **1967**, George Caldwell submitted the results of his investigation of children attending residential schools in Saskatchewan to the Department of Indian Affairs (Blackstock, 2016, n.p.) confirming that the majority of children – 80 percent – in these schools were placed there for child welfare reasons (Blackstock, 2016, n.p; Caldwell, 1967) providing further evidence that residential schools were primarily child welfare institutions. Caldwell's (1967) report and recommendations for the federal government to increase funding of family support services were ignored by the Government of Canada (Blackstock, 2016, n.p.; Caldwell, 1967).

In **1983**, Patrick Johnston released the findings of his research examining why there were so many Indigenous children in care in his report, *Native Children and the Child Welfare System*. Johnston's 1983 report not only provided strong evidence of the involvement of child welfare agencies in the removal of children from their families and communities,[7] but it also brought attention to the term "Sixties-Scoop" (Hanson, 2009, n.p.; Johnston, 2016, 1983, 1981). Coined by Johnston, the term "Sixties-Scoop" refers to the "mass removal of Aboriginal children from their families into the child welfare system, in most cases without the consent of their families or bands" that prevailed during the 1960s (Hanson, 2009, n.p.; Johnston, 2016, 1983, 1981).

In **1991**, the Government of Canada established the Royal Commission on Aboriginal Peoples (the Commission) to "investigate the evolution of the relationship between Indigenous peoples, the Canadian government, and Canadian society as a whole, propose specific solutions to the problems that have hindered those relationships, and examine all issues it deemed relevant to Indigenous peoples in Canada" (Prime Minister of Canada Justin Trudeau, 2021, n.p.; Royal Commission on Aboriginal Peoples, 1996a, 1996b, 1996c, 1996d, 1996e). Five years later, the Commission released the results of its inquiry

6 This was captured in detail by historian John Milloy (1999) in his book *A National Crime: The Canadian Government and the Residential School System, 1879 to 1986.*

7 In looking at the percentage of Indigenous children in care in the province of British Columbia (B.C.), Johnston (1983) found that "[i]n 1955 there were 3,433 children in the care of B.C.'s child welfare branch. Of that number, it was estimated that 29 children, or less than 1 per cent of the total, were of Indian ancestry. By 1964, however, 1,446 children in care in B.C. were of Indian extraction. That number represented 34.2 per cent of all children in care. Within ten years, in other words, the representation of Native children in B.C.'s child welfare system had jumped from almost nil to a third. It was a pattern being repeated in other parts of Canada as well" (Royal Commission on Aboriginal Peoples, 1996c, p. 22; Johnston, 1983; 23).

calling for "a complete restructuring of the relationship between Indigenous and non-Indigenous peoples in Canada…This new relationship would acknowledge and respect Indigenous cultures and values, the historical origins of Indigenous nationhood and the inherent right to Indigenous self-determination" (Doerr, 2021, n.p.; Government of Canada, 2010, n.p.; Royal Commission on Aboriginal Peoples, 1996a, 1996b, 1996c, 1996d, 1996e). The five-volume document outlined 440 recommendations involving: Indigenous governance, nation rebuilding, lands and resources, treaties, economic development, and social policy, including child welfare (Prime Minister of Canada Justin Trudeau, 2021, n.p.; Royal Commission on Aboriginal Peoples, 1996a, 1996b, 1996c, 1996d, 1996e). Throughout the inquiry, presentations along with evidence submitted to the Commission found Canada's residential schooling was a "persistent and destructive force" on relations between Indigenous peoples, the Canadian government, and Canadian society, as were Canada's child welfare policies:

> The effect of these policies, as applied to Aboriginal children, was to tear more holes in the family web and detach more Aboriginal people from their roots. Authorities had only one remedy for children thought to be in need of protection – removal from their families. Authorities were not able to alleviate family poverty, fix crumbling houses, or support young parents who had themselves been raised in institutions, without parents as models. They made little or no attempt to place children at risk with members of their kin network or with other Aboriginal families who could help them hold on to their culture and identity (Government of Canada, 2010, n.p.; Royal Commission on Aboriginal Peoples, 1996a, 1996b, 1996c, 1996d, 1996e).

Evidence submitted to the Commission showed that Canada's child welfare system was based on colonial polices specifically designed to assimilate Indigenous children, and an extension of the country's residential school system (First Nations Child and Family Caring Society of Canada, 2022, n.p.; Royal Commission on Aboriginal Peoples, 1996e, p. 24). The Government of Canada's willingness to fund child-in-care costs yet reject financial responsibility for preventative services was also found to be the basis for decisions that made the apprehension and permanent removal of children the preferred solution in child removal cases (First Nations Child and Family Caring Society of Canada, 2022, n.p.; Royal Commission on Aboriginal Peoples, 1996e, p. 24). Included in the Commission's recommendations were calls for action by the Government of Canada to: reform existing child welfare services; shift government funding towards family supports as opposed to child-in-care costs; and transfer control of child welfare services to the Indigenous people (First Nations Child and Family Caring Society of Canada, 2022, n.p.; Royal Commission on Aboriginal Peoples, 1996e, pp. 48–49; Government of Canada, 2010, n.p.). According to the Commission, "[c]hild welfare is one of the services that Indigenous people want most to control for themselves" (Government of Canada, 2010, n.p.) and enhanced data collection and information exchange (McBride, n.d., p. 3).

In **2015**, The Truth and Reconciliation Commission (TRC, 2015a) released 94 "Calls to Action" to redress the legacy of Canada's system of residential schools and advance the process of reconciliation, which included changes to Canada's Indigenous system of child welfare. Included in the TRC's (2015a, p. 1) Calls to Action were: the adoption and implementation of initiatives designed to reduce the number of Indigenous children in care; the collection and storage of data regarding the number of Indigenous children in care, the reasons for the displacement of Indigenous children, the costs of preventative care and effectiveness of interventions; the implementation of Jordan's Principle; the enactment of Indigenous focused child-welfare legislation that establishes national standards for Indigenous child apprehension and custody cases; and the development of culturally appropriate programs for Indigenous families.

In **2018**, the Ontario Human Rights Commission (OHRC) released its report, *Interrupted Childhoods: Over-Representation of Indigenous and Black Children in Child Welfare*. The OHRC's (2018, p. 2) inquiry found that the overrepresentation of Indigenous children in Canada's foster care system can be attributed to a number of "complex and multi-faceted" issues stemming largely from the intergenerational effects of colonialism and associated child welfare practices. Services provided under Canada's system of child welfare were found to be racially biased against Indigenous peoples (Choate, 2018, p. 5; McKay, 2018). Racial biases linked to child welfare have a spillover effect by influencing policy, decision making about placement in out-out of home care, and ultimately, contributing to the overrepresentation of Indigenous children in care (Choate, 2018: pp. 5, 32; McKay, 2018; Drake et al., 2011). The OHRC traced chronic family concerns such as poverty, poor and unsafe housing, substance use, mental health issues and social isolation to decades of oppressive and discriminatory policies such as Canada's Indian Residential Schools and Sixties Scoop which led to the removal of children from their family structures (McKay,

2018). Many of the structural biases that contributed to the Indian Residential Schools and Sixties Scoop are still being incorporated, and to some extent enhanced with child welfare decision making (Choate, 2018, p.33). The OHRC (2018) further noted the critical importance of ensuring open dialogue with Indigenous and racialized communities, as well as the utility of data collection and analysis, in providing context to the issue of over-representation.

In **2019**, The National Inquiry into Missing and Murdered Indigenous Women and Girls (MMIWG) (2019a, 2019b) released its report, *Reclaiming Power and Place: The Final Report of the National Inquiry into Missing and Murdered Indigenous Women and Girls*. The National Inquiry's Final Report revealed "that persistent and deliberate human and Indigenous rights violations and abuses are the root cause behind Canada's staggering rates of violence against Indigenous women, girls and 2SLGBTQQIA people" (National Inquiry into Missing and Murdered Indigenous Women and Girls, n.d.). The Final Report provided 231 individual Calls for Justice requiring "for transformative legal and social changes to resolve the crisis that has devastated Indigenous communities across the country" (National Inquiry into Missing and Murdered Indigenous Women and Girls, n.d.; CBC News, 2019). For many child welfare advocates, the Final Report solidified the "causal relationship between the plight of missing and murdered Indigenous women and [Canada's] child welfare system," (Taylor, 2018, n.p.) a sentiment that was echoed in the testimonies of witnesses throughout the inquiry (Morgan, 2008; Taylor, 2018).[8] The Final Report also highlighted the need for comprehensive data collection by federal and provincial Governments in order to address the crises as well as the involvement of Indigenous peoples in the process (CBC News, 2019).

Current structure of health and social services for First Nations children

Legal framework for the delivery of health and social services across Canada

The organization and structure of Canada's healthcare system is largely determined by Canada's Constitution Act, of 1982, in which jurisdictional roles and responsibilities over healthcare are divided between federal, provincial and territorial governments (Government of Canada, 2021a, n.p.; Behrend, Forsyth, & Mohamed, 2021, p. 4). In general, primary jurisdiction over the administration and delivery of health care services – including setting healthcare priorities, administering healthcare budgets and managing healthcare resources – is delegated to provinces and territories (Government of Canada, 2021b, n.p.; Behrend, Forsyth, & Mohamed, 2021, p. 4). The federal government has spending power over healthcare primarily through the use of transfer payments to support provincial and territorial delivery of health services to residents (Government of Canada, 2021b, n.p.; Behrend, Forsyth, & Mohamed, 2021, p. 4).

The allocation of healthcare responsibility for Indigenous peoples – which includes First Nations, Inuit and Métis – is shaped by an intricate web or what is often referred to as a "jurisdictional patchwork" (Gouldhawke, 2021, n.p.) of policies, legislation and relationships (Government of Canada, 2021a, n.p.; Behrend, Forsyth, & Mohamed, 2021, p. 4). Responsibility is "divided between the provinces, territories, the federally-funded Non-Insured Health Benefits (NIHB)[9] program for First Nations and Inuit, and finally, limited Métis programs via

8 According to Qajaq Robinson, former Commissioner for the MMIWG "I'd say probably a third to a half of all the testimonies [I heard] in each area [spoke] to child welfare or child and family services – from limitations in terms of the supports that they receive; the eligibility; the lack of services available, particularly in remote locations…where the agencies are either not staffed enough or just don't have the resources available to assist with the needs that families have. In a number of the cases involving disappearances or murders, often we [heard] about it as a factor for women who, for example, have either struggled with addiction or struggled with trauma, and their struggles have resulted in their children being either apprehended or, you know, [placed] under some form of care and supervision. And then the removal of the children having a really, really devastating impact on [their] will to go on – I don't know how else to describe it. It has a real devastating impact of loss and of grief … that heartbreak of being separated from one's child, whether it was through residential school – because we [heard] a lot about that – or through the child-welfare system" (Morgan, 2018, n.p.).

9 The NIHB program "supports the health needs of First Nations and Inuit by: ensuring availability of, and access to, quality health services; supporting greater control of the health system by First Nations and Inuit; and, supporting the improvement of First Nations health programs and services through improved integration, harmonization, and alignment with provincial/territorial health systems. [It] also provides eligible First Nations and Inuit, regardless of where they live, with supplementary health benefits not covered by provincial or territorial health insurance or private programs such as prescription drugs, medical supplies and equipment, dental and vision care, short term mental health crisis counselling and medical transportation" (Behrend, Forsyth, & Mohamed, 2021, p. 4). For a detailed overview of the NIHB program, see Government of Canada (2021c). For information regarding other healthcare services and supports, including: coronavirus; nursing careers; access to community care programs, health services and nursing care; mental health; substance use; family health; diseases that may affect First Nations and Inuit communities; and environmental issues and health, see Government of Canada (2021b).

Indigenous Services Canada [ISC][10]" (Gouldhawke, 2021, n.p.). The complexity of Canada's healthcare system, according to Mike Gouldhawke (2021), a Métis and Cree writer and community organizer, means that in Canada, there are effectively 15 different healthcare systems (n.p.). Adding to this complexity is the division of healthcare responsibility and funding for First Nations and Inuit communities on reserve:

> [p]rovincial/territorial governments provide hospitals, physicians, and public health programs, but rarely operate direct health services on-reserve. The federal government, via the FNIHB of ISC, funds and, in some cases, delivers health programs and services for the First Nations and Inuit populations living on-reserve or traditional territory. These federally funded programs and services are intended to be complementary to health services provided by provincial/territorial governments, First Nations organizations and communities and third-party services providers (Behrend, Forsyth & Mohamed, 2021, p. 3).

For Métis, off-reserve First Nations and non-status First Nations, services and benefits are primarily provided for by provinces and territories (Government of Canada, 2021b, n.p.). According to Indigenous Services Canada, "[a] coordinated approach to address the health needs of First Nations, Inuit and Métis, and health care delivery among all levels of government including Indigenous governments, remains an ongoing challenge. Improved clarity and a shared understanding of the role of various levels of government is needed, including for Métis, off-reserve First Nations and urban Inuit populations" (Government of Canada, 2021b, n.p.).

Jordan's Principle is a "child-first" principle adopted in 2007, that is designed to ensure that in situations where there is a funding dispute between federal and provincial governments, or between federal departments with regard to the provision of essential services[11], First Nations children do not experience delays, disruptions or denials of services typically available to other Canadian children (Government of Canada, 2019). Under provisions of Jordan's principle, the government department of first contact is required to pay for the service(s) provided to a First Nations child, and that funding issues be resolved after services are provided (Government of Canada, 2019). Jordan's Principle is named in honour of Jordan River Anderson, a First Nations child from Norway House, Manitoba, requiring complex care who died in hospital while the federal and provincial governments battled over funding responsibilities for Jordan's at-home care needs (Canadian Pediatric Society, 2019; Government of Canada, 2019; First Nations Child and Family Caring Society of Canada et al. v. Attorney General of Canada, 2017).

Since Jordan's Principle implementation, which began in earnest in 2017, there has been funding to support Jordan's Principle requests for essential services. An overview of the number and types of service coordination organizations across Canada is included in Table 1.2 on p. 30.

Evidence on disparities in health outcomes between Indigenous and non-Indigenous populations

A review of chronic health conditions of Indigenous Peoples by the Royal College of Physicians and Surgeons of Canada (RCPSC) found that in comparison to non-Indigenous populations, First Nations, Métis and Inuit populations experience "a disproportionately high burden of chronic diseases and associated risk factors" (King, Smith, & Gracey, 2009; Royal College of Physicians and Surgeons of Canada, 2019, p. 66):

- "[In 2016] 59.8 per cent of First Nations adults reported having one or more chronic health conditions. Diabetes, arthritis, high blood pressure, allergies and chronic back pain remain the most commonly reported conditions" (First Nations Information Governance Centre, 2018a; Royal College of Physicians and Surgeons of Canada, 2019, pp. 66–67).

10 Key social programs ISC funds in First Nation communities, as well as other supports for Inuit families include: First Nations Child and Family Services (funds prevention and protection services to support the safety and well-being of First Nation children and families on reserve); Family Violence Prevention Program (supports shelters, as well as funding for community-driven proposals for family violence prevention projects); On-reserve Income Assistance Program (supports greater labour market participation in First Nation communities); Assisted Living Program (provides funds to identified service providers to help provide non-medical, social support services to people living on-reserve with chronic illness or disability); Urban Programming for Indigenous Peoples (funding for organizations and projects that support urban Indigenous peoples); Jordan's Principle (supports for First Nations children); The Child First Initiative (ensures Inuit children have access to the essential products, services and supports they need); and the Community Well-Being and Jurisdiction Initiatives Program (funding to provide prevention and well-being services for First Nations children and families on reserves and in Yukon). For an overview of these, as well as other programs, see Government of Canada (2021d).

11 This includes, but is not limited to, services such as mental health, special education, dental, physical therapy, speech therapy, medical equipment, and physiotherapy.

Table 1.2 Overview of the number and type of Jordan's Principle service coordination organizations by jurisdiction

Province or Territory	Number and type of Service Coordination organizations FY 2020-2021
Alberta	1 (First Nations Health Consortium)
British Columbia	1 (First Nations Health Authority)
Manitoba	7 Tribal Councils, 1 Eagle Urban Transition Centre, and 5 specialized service providers (rehab and mental health services)
Newfoundland & Labrador	3 First Nations communities
New Brunswick	2 Tribal Councils
Northwest Territories	1 (FNIHB)
Nova Scotia	2 Tribal Councils
Ontario	5 Provincial/Territorial organizations
Prince Edward Island	1 Tribal Council (Confederacy of Mainland Mi'kmaq)
Quebec	31, including communities and First Nations organizations
Saskatchewan	10 Early Childhood Intervention Program (ECIP) agencies, 3 Tribal Councils, 1 First Nations community
Yukon	1 Tribal Council (Council of Yukon First Nations)

- "The prevalence of diabetes among First Nations adults living off-reserve and Métis adults is 1.9 and 1.5 times higher than the rate among non-Indigenous adults (Pan-Canadian Health Inequities Reporting Initiative, 2018 Royal College of Physicians and Surgeons of Canada, 2019, p. 67). Rates of Type 2 diabetes among Indigenous children and youth have also been identified as an area of concern (Earle, 2011; Royal College of Physicians and Surgeons of Canada, 2019, p. 67).
- "The prevalence of obesity among First Nations living off-reserve and Inuit is 1.6 times that of non-Indigenous people (Pan-Canadian Health Inequities Reporting Initiative, 2018; Royal College of Physicians and Surgeons of Canada, 2019, p. 67)
- "According to 2014 national estimates, Indigenous populations had HIV incidence rates 2.7 times higher than people of other ethnicities" (Yang et al., 2016; Royal College of Physicians and Surgeons of Canada, 2019, p. 67).
- "[A]reas where many people identify as First Nations, Inuit and Métis have suicide rates that are 3.7, 6.5 and 2.7 times higher than in areas with a low concentration of people who identify as Indigenous. This translates respectively to 29.2, 61.0, and 18.6 more deaths by suicide per 100,000 people, than among the non-Indigenous population" (Pan-Canadian Health Inequalities Reporting Initiative, 2018; Royal College of Physicians and Surgeons of Canada, 2019, p. 67).

The current COVID-19 pandemic provides further evidence of the disparities in health outcomes between Indigenous and non-Indigenous populations. Data have shown that COVID-19 is impacting Indigenous people at higher rates than the general population (Habib, n.d.; Froese, 2021). For example, in Manitoba in February of 2021, while only 10 percent of the population was First Nations, they accounted for 70 percent of the province's COVID-19 cases (Habib, n.d.; Froese, 2021). The disproportionality was also reflected in the ages of individuals dying as a result of COVID – 83 years old for the general population compared to 66 for First Nations people – and admissions to intensive care units (Habib, n.d.; Froese, 2021). Although there is some variation between provinces and territories, the disproportional impact of COVID-19 on the health and well-being of Indigenous populations has occurred across Canada (Hawthorn, 2021; Patterson, 2021).

Numerous calls to address inequities in health and social services

In **1991**, the Royal Commission on Aboriginal Peoples (the Commission), described in more detail above, acknowledged the troubling health disparities between Indigenous and non-Indigenous populations, what it referred to as "both a tragedy and a crisis" (Government of Canada, 2010, n.p.). The recommendations outlined by the Commission included health and social policy measures focused on "solving urgent health and social problems, promoting human capacity building in Aboriginal nations, and alerting mainstream institutions to their responsibilities to Aboriginal people" (Government of Canada, 2010, n.p.).

In **2002**, Commissioner Roy J. Romanow, Q.C. released his final report, outlining the future of healthcare in Canada. The 2002 Report noted that "the mismanagement of health care funding and a poorly designed system of care had left Indigenous peoples facing serious health inequities" (Palmer, Tepper, &

Nolan, 2017, n.p.; Romanow, 2002, pp. 211–23). Forty-seven recommendations were proposed that included recommendations for "all levels of government to come together to restructure Aboriginal health care" (Palmer, Tepper, & Nolan, 2017, n.p.; Romanow, 2002, pp. 211–23; 247–253).

In **2015**, the Truth and Reconciliation Commission Report (2015b, pp. 6–7, 139–183) acknowledges that the troubling disparities in the health outcomes between Indigenous and non-Indigenous Canadians which are deeply rooted in Canadian society continue to exist (TRC, 2015b, pp. 6–7, 139–183). The Commission found that compared to non-Indigenous populations, Indigenous populations have higher rates of suicide, infant mortality, maternal mortality and morbidity, infectious disease burdens; and dramatically shortened life expectancies (HealthCareCan, 2016, p. 2; TRC, 2015b, pp. 6–7, 139–183). In its 94 Calls to Action, recommendations 18 through 24 and 55 pertain directly to health (2015a, pp. 2–3, 6).

At a global level, recognition of the troubling disparities in the health outcomes between Indigenous and non-Indigenous populations and the dire need to address them has also come from the World Health Organization (Pulver, Haswell, Ring et al., 2010) and the United Nations (2018, 2007).

Barriers to equitable health and social services for Indigenous populations

Barriers to equitable health and social services for Indigenous populations are complex and interconnected and include: jurisdictional disputes; non-Indigenous determinants of health; racism and discrimination; exclusion of Indigenous cultural norms and practices; and the legacy of colonialism and associated government policies.

Jurisdictional disputes

Problems First Nations, Inuit, and Métis populations experience while navigating their health-care systems are "compounded by having to continuously cross jurisdictional boundaries to access the care they need. They are faced with additional challenges because federal and provincial authorities often disagree on which system should pay for which services" (Lavoie, 2017, n.p.). As discussed earlier, the allocation of healthcare responsibility for Indigenous peoples is shaped by an intricate and complex web or what is often referred to as a "jurisdictional patchwork" of policies, legislation and relationships divided between the provinces, territories, the federal government, First Nations organizations and communities, and third-party services providers. Historically, the lack of clarity resulting from this jurisdictional patchwork has been utilized by governments – both federal and provincial – to narrowly define their respective roles and responsibilities in the delivery and funding of health and social services to Indigenous populations (Palmer, Tepper, & Nolan, 2017, n.p.). Research has shown that this has led to "bureaucratic delays that leave Indigenous peoples waiting for care or medications readily available to non-Indigenous Canadians. And it's created gaps in care between Indigenous and non-status and First Nations people living off-reserve" (Palmer, Tepper, & Nolan, 2017, n.p.; Lavoie, Kaufert, Browne et al., 2015).

Looking beyond traditional social determinants of health

The World Health Organization identifies seven social determinants of health, these being: social gradient; social exclusion; work; unemployment; social support; and early life (Postl, Cook, & Moffatt, 2010, p. 45). Canadian determinants of health typically include: education; income and social status; social support networks; employment and working conditions; social and physical environments; personal health practices and coping skills; healthy child development; culture; gender; health services; biology; and genetic endowment (Postl, Cook, & Moffatt, 2010, p. 45). Although these traditional determinants are relevant to Indigenous populations, Indigenous specific determinants of health that are critical to the health and well-being of Indigenous populations are often overlooked or ignored (Postl, Cook, & Moffatt, 2010, p. 45). Moreover, because the "burden of health disparities facing all Indigenous populations is great, but not homogeneous [they] must be understood within the diverse and sometimes disparate contexts within which First Nations, Inuit and Métis people live" (Postl, Cook, & Moffatt, 2010, p. 25).

Indigenous-specific determinants of health can be organized according to three broad categories: distal (this includes historic, political, social and economic contexts); intermediate (this includes community infrastructure, resources, systems and capacities); and proximal (this includes health behaviours and physical and social environments) (Postl, Cook, & Moffatt, 2010, p. 46; Reading & Wen, 2009). Research suggests that "distal determinants have the most profound influence on the health of populations because they represent contexts that construct both intermediate and proximal determinants" (Postl, Cook, & Moffatt, 2010, p. 46; Reading & Wen, 2009). "The individual and cumulative

effects of inequitable social determinants of health are evident in diminished physical, mental, and emotional health experience by many [Indigenous] peoples. Unfavourable distal, intermediate and proximal determinants of health are associated with increased stress through lack of control, diminished immunity and resiliency to disease and social problems, as well as decreased capacity to address ill health" (Postl, Cook, & Moffatt, 2010, p. 25).

Racism and discrimination

"Racism and discrimination adversely affect health on multiple individual, interpersonal, societal, and community levels. The lived experience of discrimination is itself a strong risk factor for morbidity and mortality, while hate crimes and violence against racial minorities pose direct harm to people's bodies. These problems are compounded by the inequities of access and quality that still plague [Canada's] health system" (Canadian Nurses Association, 2021, n.p.). For Indigenous populations, the widespread reach of racism and discrimination act as barriers to accessing health and social services, even in circumstances when access to care is possible (Abma, 2018, n.p.). According to Dr. Karline Wilson-Mitchell, Director of midwifery at Canada's Ryerson University, "health equity is a significant problem in Canada, and it is largely attributed to unequal access to care, structure racism and systemic discrimination" (Abma, 2018, n.p.). Racism and discrimination within the healthcare system helps to fuel distrust of both the healthcare system and healthcare providers; and typically have unfavourable impacts on health outcomes that include emotional, physical and social harm (Canadian Nurses Association, 2021, n.p.; Abma, 2018, n.p.; United Nations Inter-Agency Support Group on Indigenous Issues, 2014, p. 9). Ultimately this results in a loss of trust in health systems which in turn results in reduced utilization of healthcare services, and ultimately to poorer health outcomes for Indigenous populations (Canadian Nurses Association, 2021, n.p.). In 2015, the RCPSC developed CanMEDS – a framework for improving patient care by enhancing the training of physicians (Royal College of Physicians and Surgeons of Canada, 2022, n.p.). CanMEDS incorporates a cultural safety approach to the use of power in the delivery of healthcare. It is "based on understanding power differentials in the health care system and serves as a concept for guiding an analysis of power in every relationship of difference" (Royal College of Physicians and Surgeons of Canada, 2019, p. 29; Hart-Wasekeesikaw, 2009; Ramsden, 2002). According to researchers, "[t]he political commitment to equity in health care that is inherent in cultural safety is required to address health inequities between Indigenous and non-Indigenous people (Royal College of Physicians and Surgeons of Canada, 2019, p. 30; Darroch et al., 2016).

Exclusion of Indigenous cultural norms and practices

The United Nations Inter-Agency Support Group on Indigenous Issues (2014) found that "of all the barriers faced by Indigenous peoples, it is perhaps the cultural barriers that present the most complicated challenge because there is little understanding of the social and cultural factors deriving from the knowledge, attitudes, and practices in health of the [I]ndigenous peoples" (p. 9). In many cases, the emphasis or bias towards westernized medicine and practices can be considered highly insensitive or inappropriate for Indigenous practitioners of traditional medicine leading to: poor communication between healthcare providers and clients; and inadequate care (United Nations Inter-Agency Support Group on Indigenous Issues, 2014, p. 9; Li, 2017; Coast, Jones, Lattof et al., 2016; Reibel and Walker, 2010; Heaman, Blanchard, Gupton et al., 2005, p. 188). Stout (1996) found that the insensitivity to Indigenous cultural values in the provision of health care is a contributing factor to Indigenous women's reluctance to seek medical attention and diagnoses for antenatal complications (Heaman et al., 2005, p. 188).

The legacy of colonialism and associated government policies and practices have resulted in intergenerational trauma that has and continues to affect the physical and mental health of Indigenous peoples (Sheppard, Shapiro, Bushnik et al., 2017: 11). The findings of the 2015 TRC (2015a, 2015b, 2015c) illustrate how destructive Canada's colonial history and policies have been to generations of Indigenous peoples (Lindstrom & Choate, 2016, p. 47). The Indian Act, 1985 Canada's Indian Residential Schools, forced sterilization, the Sixties Scoop, the millennium scoop and colonization have victimized generations of First Nations children, as well as the lives of their descendants (Riggs, 2012, p. 60). Pain, rage, and grief of unresolved trauma from these tragic events contribute to toxic stress for Indigenous peoples that can further influence the development of diseases and compromise their immunity (Iwasaki et al., 2004).

Opportunities for ending discriminatory health and social services for First Nations children

Canada's universal healthcare system is internationally celebrated for its relatively equitable access and healthcare outcomes, yet disparities in health outcomes between Indigenous and non-Indigenous populations remain; largely fuelled by jurisdictional disputes, a reliance on non-Indigenous determinants of health, racism, and discrimination, a westernized approach to the provision of health and social services which excludes Indigenous knowledge, culture, and practices, and the legacy of colonialism and the associated government policies. Growing voices within Canada and abroad calling for the transformation of Canada's system of delivering health and social services to marginalized populations provides both policy makers and healthcare providers with a unique opportunity to address longstanding health inequities and disparities faced by Indigenous populations. Through their efforts, policy makers can end discriminatory policies and practices that have fuelled health inequities for generations by formulating policies – in partnership with Indigenous populations – that support innovative and unconventional methods of delivering health and social services that speak to the unique needs of Indigenous peoples of Canada. Policies that provide the necessary resources for the development, implementation and sustainability of new and innovative models of service delivery will help broaden the supply of available services as well as the capacity of healthcare professionals to provide them.

Providers of healthcare share an equally important responsibility to reduce if not eliminate disparities in healthcare through the design, adoption, delivery and monitoring of programs that acknowledge and address barriers to the provision of health and social services to Canada's Indigenous peoples. Healthcare providers need to work with Indigenous populations to reclaim their traditional roles in their health care and ensure their well-being. This requires incorporating cultural considerations throughout all aspects of service delivery including but not limited to: the adoption of appropriate language for purposes of communication; providing safe and culturally appropriate environments free of fear and distrust often attributed to racism and other forms of discrimination that discourage Indigenous populations from seeking healthcare; and accommodating the special needs of those who have suffered generations of trauma attributed to Canada's colonial legacy and associated policies. These actions are not only critical to the health and well-being of Indigenous populations, but also an integral part of helping to shape a new direction in Canada's relations with Indigenous peoples, one built on equality, respect and dignity.

The Use of Administrative Data to Document the Delivery of Services

Marina Sistovaris, Leyco Wilson, Genevieve Sansone & CHRT Compensation Project team

The decentralized nature of child welfare and health and social services delivery in Canada presents an overarching challenge to the collection, management, storage, and use of administrative data (Laferrière & Deshaies-Moreault, 2018). However, the recent AIP to compensate thousands of individuals who have been involved in child welfare or experienced delays and denials of essential services are prompting a need to understand how administrative data can be used to assist with the identification of eligible individuals. In this section of the report, we discuss the use and governance of administrative data along with advantages and challenges of relying on this kind of information to document service delivery and identify claimants.

What is administrative data?

A search of the literature found multiple definitions of the term *administrative data* across different fields of study. For purposes of the review, the following operational definition was selected because it is effective in identifying key features and functions of administrative data as well as differentiating administrative data from other sources of data:

> "**Administrative data** refers to records that government and social services keep on the people they serve – information collected for operational purposes. Because this data is not collected for research purposes, administrative data is [not] survey data...[Because administrative] data often consists of person-level records that contain private and sensitive information, to protect confidentiality, it cannot be made openly available. [Hence,] administrative data isn't open data, either...Although administrative data cannot be released openly, these datasets can be "linked" between government ministries. This means that previously discrete personal records can be joined up, resulting in a richer dataset. Data-linking could look like matching an individual's health records with their education records; and then doing that for a whole set of people. Administrative data can also be shared in an anonymized, aggregated format between government, nonprofits, or academic researchers" (Powered By Data, 2018b, n.p.; 2018a).

It is important to highlight three salient features of administrative data in the definition above that can influence decisions regarding the utility of administrative data for decision making. First, administrative data is information generated from the daily operations of administrative systems, typically public sector agencies responsible for the provision of services to the public (Connelly et al., 2016, p. 3). Administrative data is collected by public sector bodies for specific operational purposes including: daily operations; monitoring and improving organizational performance; and effective service delivery, not for research (Administrative Data Research UK, 2022, n.p.). For this reason, "[u]nlike when dealing with well-designed and well-curated research data sets, no metadata, comparison groups, representative samples, or quality checks can be assumed" (Goroff, 2020, p. xii) with administrative data. Second, because administrative data is generated from the routine tasks of public agencies and the delivery of services to the public, administrative records contain private and sensitive person-level information which prevents it from being openly available to researchers (Powered By Data, 2018b, n.p.; 2018a, pp. 4–5). For this reason, administrative data is not open data (Powered By Data, 2018b, n.p.). Third, "[a]dministrative data from different ministries – or even different services within the same ministry – are often collected, stored, and accessed separately" (Powered By Data, 2018a, pp. 4; 2018b, n.p.).

In the field of child welfare, administrative data systems are maintained by public agencies and typically "populated and accessed by a range of users – including caseworkers, supervisors, managers, program administrators, and evaluators – and typically include demographic data, case records, and sensitive information such as maltreatment reports and entries into out-of-home placement" (James Bell Associates, 2018, p. 22).

Growing demand for better data

Quantitative fields such as financial services and pharmaceutical research have historically relied on the collection and analysis of data to help guide decision making (SAS, 2021, p.1). For many decision makers in these fields, data are considered to be an indispensable tool necessary to: identify and approach problems strategically; make informed decisions; identify what is working and what is not; manage time and resources efficiently; formulate theories and substantiate arguments (SAS, 2021). In contrast, in the field of human and social services there has been considerable hesitancy to embrace the use of data to help guide decision making (SAS, 2021, p. 1, 4). However, growing

evidence of the utility of data in decision making coupled with a shift towards evidence based practice and policy making, knowledge translation activities and building research capacity – particularly in the field of child welfare – have not only increased the acceptance of data as a decision making tool, but have also helped fuel the demand for data by child welfare practitioners, researchers, academics and government institutions (Chikwava et al., 2021; Pearson, 2021; Cole et al., 2020, p. 1; Ji & Marshall, 2020; UNICEF, 2020; Trocmé et al., 2019; Collosi-Bath, 2018; Donnelly et al., 2018; Fallon, Filippelli et al., 2017; Vandivere & DeVooght, 2014; McBride, n.d.). As outlined in the previous section, recognition of the discrimination experienced by First Nations children and families has come with calls for better documentation and data regarding these inequities (e.g., Government of Canada, 2010; McBride, n.d.; Morgan, 2008; OHRC, 2018; Taylor, 2018; TRC, 2015a)

Dr. Jerry Milner (SAS, 2021), child welfare advocate and former Commissioner of the U.S. Administration for Children and Families, acknowledges that acquiring the necessary data to make informed decisions involving children in care is not without its challenges; however, the extra effort can be justified when data can be used to minimize trauma children experience in care.

> It's simply a fact that often in our work, we unintentionally add to the trauma that children and their families experience when abuse or neglect occurs within the family context. When we move children, they experience a loss. We have data that helps us understand why children move and under what circumstances they're most likely to move. We can use that data to adapt our practice. […] Ultimately, broader use of data…should reduce the trauma that children and their families experience (SAS, 2021, p. 7).

At a global level, recognition of the pivotal role data can play in decision making – particularly decisions involving marginalized populations – has come from the United Nations Permanent Forum on Indigenous Issues (UNPFII). According to the UNPFII (n.d.) "[o]fficial data collection and disaggregation on [I]ndigenous peoples tends to be inadequate and sometimes non-existent. This in turn has had significant consequences on how the problems that [I]ndigenous peoples face are addressed" (n.p.). In 2007, the UN General Assembly passed the *United Nations Declaration on the Right of Indigenous People (UNDRIP)*. Considered to be the "most comprehensive international instrument on the rights of Indigenous peoples" (UN, 2007), the UNDRIP establishes a series of human rights standards and fundamental freedoms for the "survival, dignity and well-being of the indigenous peoples of the world" (UN, 2007). Article 19 of the UNDRIP is notable for its emphasis on the importance and necessity of data to the wellbeing of Indigenous populations "to obtain their free, prior and informed consent before adopting and implementing legislative or administrative measures that may affect them" (United Nations, 2007).

On June 21, 2021, Bill C-15, which seeks to align Canadian law with the UNDRIP, received royal assent. Although Bill C-15 does not incorporate the 2007 UNDRIP's various articles into Canadian law, what it does provide is a framework for the implementation of a plan that will assist the Government of Canada to achieve the objectives of the UNDRIP (Aiello, 2021, n.p.; McBride, n.d., p. 3). Both the UNPFII and framework of the 2007 UNDRIP are effective in bringing attention to the fact that data; and the collection, management and analysis of data is "critical for the empowerment of [Indigenous] communities and for identifying their needs" (McBride, n.d., p. 2).

Improving data quality and the process of data collection for Indigenous peoples provides a host of benefits for both decision makers, service providers, and the populations they serve:

- With better information, governments can focus their response on the best way to fund and assist First Nations Child and Family Services (FNCFS) agencies and help reduce the overrepresentation of Indigenous children in the child welfare system.
- New policies or programs can be piloted; policy makers can build support and capacity in FNCFS agencies.
- The act of improving data collection and analysis helps to fulfill the goals and targets that governments have agreed to, as well as enable governments to demonstrate they have met their obligations.
- [D]isaggregated data is essential for responding to issues of transparency, accessibility, fairness and equity in the child welfare system, and are particularly relevant for Indigenous peoples given their high level of overrepresentation in the child welfare system of Canada.
- The traditional approaches to studying FNCFS agencies (and Indigenous peoples generally) as a single entity tend to hide important intra- and interagency differences among FNCFS agencies and Indigenous populations across Canada. Indigenous peoples and FNCFS agencies as

a whole are not all the same, and there is a need to look at the outcomes for the children and families serviced by these agencies separately as well as comparatively (National Collaborating Centre for Aboriginal Health, 2009, n.p.).

Advantages of utilizing administrative data

Administrative data has specific advantages over competing sources of data for decision makers (Administrative Data Research UK, n.d.; Powered by Data, 2018a, 2018b). British researchers note that "wealth of data, the majority of which was not originally created for research but is a by-product of government services, has the potential to create important knowledge, providing powerful insights into our society and in turn pointing to areas where change is needed" (Administrative Data Research UK, n.d., n.p.). By using administrative data in innovative ways, governments and organizations responsible for the delivery of human and social services can have a much clearer and concise understanding of the communities they serve and their specific needs (Powered by Data, 2018a, p. 8).

The main advantages of administrative data include but are not limited to the following: cost efficiencies; a high level of data detail; flexibility to utilize data for longitudinal research; the ability to minimize the burden on respondents; and the sharing or linking of data. In the short-term, these advantages of administrative data may also be leveraged to support identification of claimants seeking compensation.

Cost efficiencies. Administrative data are typically collected by public sector agencies in the routine tasks associated with the delivery of services. Hence, in comparison to other data sources, (e.g., census and surveys), using administrative data is typically less expensive because there are no additional collection requirements (Statistics Canada, 2021b, n.p.).

Providing a better understanding of specific communities. Administrative data provides a higher degree of detail regarding small sub-groups of the population as long as the correct variables are present in the file (Statistics Canada, 2021b, n.p.).

Better understanding of trajectories. Because administrative data are collected on an ongoing basis, they allow for longitudinal examination of patterns, trends and projections of trajectories of specific population cohorts (Chikwava et al., 2021; Statistics Canada, 2021b, n.p.; Ji & Marshall, 2020; Collisi-Bath, 2018; Green et al., 2015). Research by Collosi-Bath (2018) found that administrative data are effective in "captur[ing] information about people across their life course while protecting confidentiality. Data collection starts with birth and is gathered through early development, schooling, socialization, transition to adulthood, and adulthood. For some populations of adults, additional information is gathered depending on their characteristics and social supports and systems they may have entered. This can include people who experience homelessness; participate in public benefit programs; people with certain disabilities; and those who have been incarcerated. As people age, additional information is recorded; the final piece of additional information is the death certificate" (p. 34).

Minimizing the burden on respondents. Again, since administrative data are already being collected, there is no additional burden on the respondents from additional data collection efforts (Statistics Canada, 2021b, n.p.; Chikwava et al., 2021, p.2; Laferrière & Deshaies-Moreault, 2018). Chikwava et al. (2021) note that utilizing child welfare administrative data "reduces the burden on individuals to disclose sensitive or traumatic experiences and also reduces the risk of recall bias, social desirability and stigma, which may occur, for instance, in retrospective self-reporting of child maltreatment" (p. 2).

Specific uses of administrative data sharing. As discussed earlier in this review, the collection of administrative data from different ministries or even from entities within the same ministry are typically collected, stored and accessed separately (Powered By Data, 2018a, p. 4). Data sharing involves the "practice of allowing more than one agency or organization to access and use administrative data for new purposes. Sharing could occur between ministries within government, as well as between government agencies and nonprofit partners" (Powered By Data, 2018a, p. 4). One of the key strengths of administrative data is that it lends itself to data sharing. Table 1.3 on p. 37 provides a snapshot of possible applications of administrative data sharing along with associated case studies illustrating its utility.

Table 1.3 Applications of administrative data sharing

Application	Contribution	Case Study
Evidence Based Policy	Administrative data can be leveraged to help inform public policy, guide decisions regarding service delivery, and provide a smarter approach to resource allocation.	The First Nations Child and Family Caring Society of Canada educates on the need for evidence-based policies to support First Nations youth. Their efforts have often been frustrated by the fragmentation of data on Indigenous children in care, and they have expressed a need for coordinated child welfare data sharing. This could provide a more comprehensive picture of Indigenous youth navigating the system, allowing the Caring Society to spend less time on Access to Information requests – and more time sharing evidence with policymakers.
Impact Evaluation	In order to understand the impact of their interventions, organizations require outcome data on their users. It can be a challenge for organizations to track the health, financial, or educational outcomes of their program recipients over time. Much of this information is already contained in administrative data held by government agencies. By accessing this data, organizations can better track outcomes and more effectively determine whether users have benefited from services.	Britain's Justice Data Lab provides an analysis of reoffending data with organizations that rehabilitate offenders in the United Kingdom (UK). This approach is generalizable across different areas: the UK government is currently establishing additional "data labs" that assess population outcomes in education, health, and employment. A similar infrastructure for leveraging administrative data in Canada could provide exciting ways for organizations to better understand the outcomes associated with their interventions.
Service Delivery	Linking administrative data across agencies would enable a more integrated approach to service delivery, which presents an enormous benefit to individuals who have complex needs.	Survivors of interpersonal violence often require access to housing, mental health, and social assistance services. Navigating these on an individual basis can be a confusing and exhausting process. Data sharing across agencies would allow for greater collaborative care, more streamlined referral processes, and increased consistency across services.
Social Research	By linking together client records on service-use, demographic information, and outcomes, researchers can address new and complex questions.	The Child and Youth Data Lab linked data across ministries to better understand the effects of fetal alcohol spectrum disorder on young Albertans. The group also researches questions such as how early childhood experiences affect later childhood, and whether repeat offending for youth in the criminal justice system is linked to mental health outcomes. These research findings can, in turn, drive advocacy efforts for evidence-based policy making.

Limitations of utilizing administrative data

Variations in child welfare and health practices attributed to jurisdictional divisions are central to discussions concerning Canada's welfare system and in many cases, these divisions magnify the problems of using administrative data. There are additional challenges to using administrative data. This includes but is not limited to issues surrounding: data collection methods; data quality; the sharing and linking of data; accessibility issues arising from ethical, privacy and confidentiality concerns; and the impact of funding on the administrative data systems responsible for the collection, management, storage and use of administrative data.

Differences in data collection methods

The possibility of errors arising from data treatment and transmission processes at the source exist not only for administrative paper records that need to be coded and captured, but also for administrative data that is available in electronic form (Statistics Canada, 2019, n.p.; Laferrière & Deshaies-Moreault, 2018). With electronic forms, child welfare workers typically enter data from cases using combinations of drop-down menus, check boxes and text fields (Laferrière & Deshaies-Moreault, 2018, p. n.p.). In some cases, not all relevant variables may be captured by the various fields (Laferrière & Deshaies-Moreault, 2018). Text fields do not allow for the standardization in what is written, why it is written, or the level of detail provided (Broomfield & Higgins, 2004); thus, inconsistencies from worker-to-worker limit comparability of what is written as well as what can be retrieved from free text.

Different data collection methods and analyses make country-wide data comparisons difficult, an issue identified by the 1996 Royal Commission on Aboriginal Peoples in their analysis of admission statistics submitted by child welfare agencies. The Commission comments on several potential challenges in interpretation, "agencies may gather statistics on the basis of admissions. One family with several members admitted to care several times for short periods will inflate the numbers. Similarly, children in long-term care may not be distinguished from short-term placements in counting numbers of children in care at a particular point in time. Days of care provided may be a clearer quantitative measure, but the numbers do not shed light on patterns of care and duration of placements" (Royal Commission on Aboriginal Peoples, 1996c, pp. 89–90).

Variations and inconsistencies in the operationalization and coding of key variables such as type of abuse, perpetrator relationship to child and types of out-of-home placements across agency databases also make comparisons across populations difficult (Green et al., 2015; Royal Commission on Aboriginal Peoples, 1996c, p. 89) and can lead to issues with bias (Statistics Canada, 2019, n.p.). Because the operationalization of these key concepts and definitions are the responsibility of those who not only create the file, but also manage the file for their own purposes, concepts and definitions may not be applicable in other contexts, thus limiting the utility of the data (Statistics Canada, 2021b, n.p.; Green et al., 2015). Furthermore, key variables and definitions are created to serve specific purposes; they often change and evolve over time, limiting their comparability over time (Statistics Canada, 2021b, n.p.; Statistics Canada, 2019, n.p.).

Differences in data quality

To ensure data integrity and quality, it is necessary that each data item in the administrative record is vetted in terms of quality; and concepts, definitions and procedures underlying the collection and processing of the administrative organization are clearly articulated (Statistics Canada, 2019, n.p.). The quality of administrative data can vary significantly across data providers because of differences in how the various dimensions of quality are valued (Statistics Canada, 2021b, n.p.; Statistics Canada, 2019, n.p.; Green et al., 2015). When such processes are not vetted, this can lead to worker inconsistencies. Data can be inaccurate due to worker input error, as well as the value workers place on the purpose of data entered in administrative systems (Drake & Jonson-Reid, 1999; Lurie, 1990).

Because "[administrative data][are] limited to the population on whom administrative records are kept, [in many cases], this population is different from the target population which results in sources of under-and over-coverage (Statistics Canada, 2021b, n.p.; Statistics Canada, 2019, n.p.; Laferrière & Deshaies-Moreault, 2018). For example, data contained in child protection administrative systems do not reflect all children harmed and rather only reflect those that come to the attention of authorities (e.g., Gilbert et al., 2009; Davies & Ward, 2012). Furthermore, administrative files may be incomplete (i.e., missing items or records) due to partial and total non-response; the lack of timeliness in the collection of all administrative data which often results in greater non-response; and/or outdated administrative sources (Statistics Canada, 2019, n.p.; Green et al., 2015).

Access issues attributed to ethical, privacy and confidentiality concerns

Ethical, privacy and confidentiality concerns can impede access to data and in some cases, the legal frameworks governing these issues are used by government officials to "persuade potential users of administrative data from pursuing access" (Green et al., 2015, p. 47; Goerge & Lee, 2013, p. 435). Because administrative data often has detailed information about specific people, it is imperative that individuals and organizations that not only use, but also release administrative data take into consideration ethical issues throughout the process, and ensure that the data are used in ways that will benefit society (Statistics Canada, 2021b, n.p.; Statistics Canada, 2019). For example, respondents to censuses and surveys most often are aware of what data is being collected; and since the majority of surveys are voluntary, give their consent for the collection and use of data (Statistics Canada, 2019, n.p.). By contrast, with administrative data, it is difficult to not only inform, but also ask for consent from all units in the data set without the formulation of, and adherence to ethical, privacy and confidentiality provisions and guidelines (Statistics Canada, 2019, n.p.; Green et al., 2015).

Risks associated with linking or sharing administrative data

It is often valuable to combine (e.g., for tracing respondents, for supplementing data sources, or for data analysis) an administrative source with another source of information; however, linking data presents a number of risks to privacy requiring clear policies outlining protective measures, the record linkage plans

and the identity of parties to any agreements to share information (Statistics Canada, 2019, n.p.; James Bell Associates, 2018, pp. 23–25). Privacy concerns emerge when a single administrative record source is linked to another source. In such cases, the subjects may not be aware that information supplied on two separate occasions is being combined (Statistics Canada, 2019). As with data linking, the sharing of administrative data carries it share of risks, these being: informed consent; misinterpretation of data; restricting the autonomy of service providers; the amplification of inequities through data-driven decision making; and security, privacy and public trust (Powered By Data, 2018a, pp. 10–11; James Bell Associates, 2018, pp. 23–25). Table 1.4 provides a brief description of each of the risks associated with sharing of administrative data.

Table 1.4 Risks associated with sharing administrative data

Risk	Description
Consent	"Central to administrative data sharing is the idea that data originally collected for operational needs can be used in new ways. What could happen when data is used for purposes beyond what the user originally consented to? In the UK, frontline outreach workers collect nationality, mental health, and gender data of the homeless for the Greater London Authority in order to help policy makers identify the needs of the homeless population. In 2017, it was discovered that Home Office immigration officials were secretly using this nationality data to identify the location of illegal immigrants sleeping on the streets and deport EU nationals" (Powered By Data, 2018a, p. 10).
Misinterpretation of Data	"Without appropriate data literacy and expertise, good data can lead to bad conclusions. Policy makers and service providers must be careful to interpret findings properly before using data to inform decisions. For example, despite the strong link between mental health and the prison system, early iterations of [a study seeking to understand recidivism by accessing prison data] excluded offenders with identified mental health issues. Generalizing these findings across a typical range of service users would likely be a very inappropriate comparison, leading to faulty conclusions and potentially harmful decisions "(Powered By Data, 2018a, p. 10).
Restricting the Autonomy of Service Providers	"[Service providers] make many decisions based on knowledge they gain through relationships with the communities they serve. Innovative uses of administrative data may provide valuable insights, especially when used to complement the experiences and knowledge of service providers. On the other hand, top-down imposition of evidence-based decision making could prevent service providers from exercising their local discretion. This could result in programs that are less responsive to community context. Increased use of administrative data to drive decisions around resource allocation will need to be ***explored with*** [service providers], rather than ***done*** to them (Powered By Data, 2018a, p. 10).
Amplification of Inequalities Through Data-Driven Decision Making	"Administrative data poses exciting opportunities to make evidence-based decisions on pressing social issues. However, administrative datasets themselves may reflect biases of the systems they are collected in. For example, data on the overrepresentation of Black and Indigenous people in Canadian prisons reflects discrimination in the criminal justice system and the over-policing of racialized groups. Using this data to inform decision-making could pose a danger of amplifying (and providing faulty validation for) further discrimination….Marginalized groups face higher levels of data collection when they access public benefits, walk through highly policed neighbourhoods, enter the healthcare system, or cross-national borders. That data acts to reinforce their marginality when it is used to target them for suspicion and extra scrutiny" (Powered By Data, 2018a, p. 11).
Security, Privacy and Public Trust	"Detailed person-level data, when aggregated across sources can be considered an invasion of privacy. Linking data in a centralized way also poses greater consequences in the event of a data breach. Breaches are not unprecedented: in 2007, 25 million child database records went missing in the UK. Public concerns around privacy and surveillance have the potential to shut down large-scale administrative data-sharing projects. The Australia Card, which was intended to be a national card to centralize different government ID systems, was withdrawn in 1987 due to public mistrust" (Powered By Data, 2018a, p. 11).

Review of jurisdictional directions regarding data expungement and confidentiality

Conversely, policies intended to protect the confidentiality of individuals about whom data is collected can lead to data archiving or expungement. Table 1.5 on p. 40 highlights different data expungement practices under Child and Family Services legislation of each province/territory. There is no clear limit on the amount of time a record of personal information is to be retained by a Minister, director, or service provider before it is destroyed. There are, however, different factors to be considered for expungement procedures when it comes to retention; a summary of the differences is delineated in the table below. Please refer to Appendix K for a full review of child welfare data expungement policies and practices.

Table 1.5 Description of child welfare information and data expungement policies across Canada

Jurisdiction	Brief Description of Information Practices Under Provincial Child and Family Services Legislation
Alberta	The Child, Youth and Family Enhancement Act and its accompanying regulations sets out a director must keep records with respect to a child who is the subject of an investigation, agreement, or order under the Act.[12] Subsection 127(4) establishes that the records shall be kept until 100 years after the year to which the information contained in the records relates.[13] However, the Minister may order the destruction or consent to destruction prior to the 100-year ceiling.[14]
British Columbia	All personal information must be retained for at least one year so affected individuals may access it.[15] Personal information that is related to youth justice, forensic psychiatric, and specialized intervention services must be disposed of in accordance with the Youth Justice, Forensic Psychiatric, and Specialized Intervention Services Operational Records Classification System.[16] Personal information under the CFCSA that is **not** related to youth justice, forensic psychiatric, and specialized intervention services must be retained until an information schedule is applied or the chief records officer approves its disposal.[17]
Manitoba	Agencies must close records upon completion of a service. Records are retained for a period of time suitable for the individual to access that information and for assisting the agency in providing services – which the director has the discretion to determine. At that point they are "closed."[18] The director also has the discretion to determine the process that dictates when records are destroyed with privacy in mind.[19]
New Brunswick	The Minister may request any civil servant, regional health authority, or person employed by a regional health authority to produce any document or record that relates to a child identified by the Minister or to that child's parents, siblings, or associates.[20] Subsection 11.1(3) suggests the purpose of the requirement is the provision of social services for the child and/or the child's family.[21] This, and other information gathered in relation to any person or matter under the Family Services Act, is confidential to the extent such information is identifiable.[22] The Family Services Act and the accompanying regulations are silent regarding the duration of retention.
Newfoundland and Labrador	The Children, Youth and Families Act sets out that the Access to Information and Protection of Privacy Act does not apply; information practices are solely governed under the Children, Youth and Families Act.[23] This framework is silent on the permissible duration personal information may be retained.

Table 1.5 Description of child welfare information and data expungement policies across Canada *(continued)*

Jurisdiction	Brief Description of Information Practices Under Provincial Child and Family Services Legislation
Northwest Territories	The Access to Information and Protection of Privacy Act mandates that information may only be collected if, among other things, it relates directly and is necessary for an existing program or activity of the public body or a proposed program where collection has been authorized with the approval of the Executive Council.[24] A public body may only disclose personal information for research purposes if it is necessary; not harmful to the affected individual; the head of the public body has approved conditions relating to confidentiality, removal or destruction of identifiers at earliest reasonable time, and prohibitions on subsequent use; and the affected individual has provided consent to the public body's policies and procedures relating to confidentiality.[25] The Child and Family Services Act mandates that information disclosed shall be used only for the purpose for which it was disclosed and shall not be disclosed further.[26] Aside from information that is disclosed as between public bodies, the statutory framework is silent on the duration for which information can be retained by a public body.
Nova Scotia	The Children and Family Services Act references the retention of personal information in the context of its Child Abuse Register under section 63.[27] Likewise, section 53A entitles a person over the age of 19 who was subject to an order of permanent care and custody pursuant to clause 42(1)(f) and who was not adopted to apply seeking the disclosure of personal information and information relating to their birth family and the reason they were removed.[28] Clause 53A(1)(b) requires the Minister to disclose all such information except that which, in the Minister's opinion, poses a risk to the health, safety, or well-being of any person to whom the information relates. The framework is silent on the duration for which the Minister may retain personal information.[29]
Nunavut	Nunavut's statutory framework is identical to that found in the Northwest Territories, supra.
Ontario	The Minister has the discretion to collect personal information.[30] When it comes to research, the minister and service providers must justify the length of time the information is retained.[31] Service providers must set out a retention policy, which must contain a period of time during which information is retained.[32] The factors to be considered in determining duration of retention reflect an "as the case may be" justification process.[33]
Prince Edward Island	Section 7 of the Child Protection Act grants the Director discretion to keep records of information gathered during the Act's administration to monitor and evaluate service delivery.[34] The accompanying regulations set out that separate records shall be kept in respect of a person who is a child, youth or parent and those who receive protection services under the Act.[35] The framework is silent on the permissible duration for which information may be retained; it seems this is determined at the discretion of the Director.
Quebec	Section 72.9 of the Youth Protection Act grants the Government discretion to establish a register in which personal information is contained from child's record by regulation.[36] The regulation must indicate which personal information will be entered in the register and on what conditions, as well as who will oversee the register. Section 73 of the Act respecting Access to documents held by public bodies and the Protection of personal information mandates that personal information that is retained by a public body must be destroyed once the purposes for which it was collected or used have been achieved.[37]
Saskatchewan	The Child and Family Services Act is silent on the duration for which personal information may be retained. Service providers must preserve confidentiality in the course of retention.[38]

Table 1.5 Description of child welfare information and data expungement policies across Canada *(continued)*

Jurisdiction	Brief Description of Information Practices Under Provincial Child and Family Services Legislation
Yukon	The Child and Family Services Act only overrides the Access to Information and Protection of Privacy Act when it comes to the confidentiality of adoption files, which may not be open to inspection without leave of the court.[39] The Access to Information and Protection of Privacy Act mandates disposal[40] of personal information that is collected without request[41] or authorization,[42] used for a research purpose,[43] or no longer necessary to carry out the purpose for which it was collected.[44]

Impact of infrastructure and funding on administrative data systems

Inadequate infrastructure (including computer equipment, updated software and hardware, collaborative computerized database systems, IT expertise and researchers) and funding (Statistics Canada, 2019, n.p.; Laferrière & Deshaies-Moreault, 2018) impede the ability of child welfare service providers, particularly for remote FNCFS agencies to collect, record and produce quality and relevant information for provincial, territorial and federal governments (National Collaborating Centre for Aboriginal Health, 2009, n.p.; Bennett & Shangreaux, 2005; Loo, 2005). Reviewing administrative systems on a global stage, UNICEF (2020) found that child welfare and justice systems were underfunded, thus rendering the quality of administrative systems a lower priority, subsequently resulting in limited resources to attribute to statistical analysis. In Canada, administrative systems run by child welfare services on Indigenous reserves are underfunded, only covering one quarter of non-profit industry standards in information technology (IT) spending (IFSD, 2019).

A closer look at Indigenous data governance

Indigenous data is information that reflects and impacts the collective and individual lives of Indigenous peoples, which includes lands, resources, cultural information, traditional knowledge, and information about individuals, families, and communities (Carroll et al., 2020; Rainie et al., 2019). The collection and management of information and data related to Indigenous peoples by non-Indigenous researchers or institutions raises ethical issues and concerns that must be addressed. These concerns largely stem from colonial and assimilationist practices and policies within Canada – such as the *Indian Act* of 1876, the White Paper of 1969, residential schools, and the Sixties Scoop – that have forcefully suppressed and marginalized Indigenous identities and cultures over generations. Research and evaluation efforts related to Indigenous peoples have historically been conducted from a Euro-centric perspective that does not respect or understand Indigenous values and traditions and systematically excludes from decision-making that affects their communities (Ormiston, 2010).

Misuse of data

There is a plethora of examples of the unethical use of research with First Nations, Inuit, and Métis peoples in Canada. For instance, many children in residential schools were subjected to cruel nutritional and vaccine experiments without their consent or knowledge (Mosby, 2013). Certain children who were forcefully removed during the residential school period and Sixties' Scoop were identified for removal using governmental datasets and registries (e.g., Johnston, 1983). Research done without including the communities involved

39 *Child and Family Services Act*, RSY 2008, c. 1, s 132.
40 Yuk. Reg. O.I.C. 2021/25, s 6.
41 Ibid., at s 18(1)(c)(i).
42 *Access to Information and Protection of Privacy Act*, RSY 2018, c. 9, s 14(4)(b).
43 Ibid., at s 26(1)(b)(v).
44 Ibid., at s 12(b).

has often resulted in weaponizing the identities of Indigenous Peoples to push stereotyped narratives (e.g., Chaney, 2018; Cormack et al., 2019; Mosby, 2013; Pool, 2016), ultimately contributing to the harmful Five-D data narrative described as disparity, deprivation, disadvantage, dysfunction, and difference (Walter, 2016). Type 2 diabetes research studies only detailed the presence of the disease as part of a "racial" problem with Indigenous peoples, but when interpreted with an Indigenous worldview, the connection between colonization and diet were made, and the discourse shifted from a deficit-based community to one where cultural disruption had occurred (Jennings et al., 2018).

Furthermore, Western understandings of data and documentation have dismissed Indigenous ways of teaching and knowledge sharing, which have long been centred on oral traditions and storytelling (Ormiston, 2010). The Auditor General of Canada has questioned the relevance of data collected by the federal government on Indigenous peoples receiving services from Indigenous Services Canada, which has been found to prioritize financial outcomes at the detriment of information on results, priorities, and wellbeing of communities (Bruhn, 2014). As always, the paradigm seems to be one where "[c]ollection requirements are dictated to First Nations rather than based on discussion with them" (Bruhn, 2014, p. 9). As a result of these practices, feelings of apprehension and distrust have developed among Indigenous communities towards non-Indigenous researchers (Burnette & Sanders, 2014; Government of Canada, 2018).

> The lack of involvement of communities in the development and use of data, and the drive for data collection from outside authorities, has led to a situation where Indigenous communities do not trust the data collection process and are often resistant to sharing their information (McBride, n.d., p. 6).

According to analysts (National Collaborating Centre for Aboriginal Health, 2009, n.p.; Bennett & Shangreaux, 2005; McBride, n.d., pp. 9–10), this lack of oversight in the collection and analysis of the data involving Indigenous populations is problematic because in many cases, the wrong data is being collected:

> [T]he data that [FNCFS agencies] are required to forward to the [federal government] as required by their respective funding agreements are collected without any analysis by the federal government as to what this data may reveal locally, regionally and/or nationally about current trends in First Nations child welfare. In many cases, the data that is being collected is flawed or not being processed or analyzed in ways that can inform decision making (National Collaborating Centre for Aboriginal Health, 2009, n.p.; Bennett & Shangreaux, 2005). What the collected data doesn't say is how FNCFS agencies differ from one another or about their specific achievements, challenges, needs and/or service trends. In other cases, the complete or the right data is simply not being collected (National Collaborating Centre for Aboriginal Health, 2009).

Current efforts to enhance Indigenous data sovereignty and governance

While tensions regarding data have remained between Indigenous communities and the federal government in Canada (Bruhn, 2014), in recent years Indigenous peoples and organizations have worked to reclaim and restore their own culture and worldviews on the path towards decolonization and self-determination (Ormiston, 2010). Part of this involves reconceptualizing and redefining data governance processes to include and respect Indigenous perspectives, knowledge, and rights. Importantly, Indigenous people have a right to determine how data is collected within their communities, and how it is then interpreted, stored, managed, and shared. The concepts of Indigenous data sovereignty and governance have guided these shifts in reclaiming how information is obtained and used:

> **Indigenous data sovereignty** is a notion defined according to the rights of Indigenous peoples to determine how and why data is collected, how it is stored and managed, and how it is used and interpreted for research or other purposes (Carroll et al., 2019; Kukutai & Taylor, 2016; Walter, 2016; Raines et al., 2017). The sovereignty of Indigenous data is rooted in the sovereignty Indigenous peoples have as Nation states (e.g., Kukutai & Taylor, 2016; Mustimuhw Information Solutions Inc., 2016).
>
> **Indigenous data governance** accounts for the development of conceptual frameworks that inform the processes of control, standards, and metrics used for research and evaluation with Indigenous Peoples (Carroll et al., 2020; Wende, 2007). In other words, Indigenous data governance refers to the producer, receiver, and governor of Indigenous data, and the relationship amongst these actors (Kooper et al., 2011). Considering the various bodies collecting and holding data related to Indigenous people in Canada, such as child welfare administrative bodies, it is paramount

> and a right that Indigenous peoples have meaningful input and decision making in terms of what said data is used for when it impacts legislative and administrative programming for their communities (FNIGC, 2020; Schultz & Rainie, 2014; United Nations, 2008).

The aim of these efforts is to ensure not only that Indigenous communities are meaningfully involved throughout the entire research process, but also that the research will benefit the affected communities and minimize harm. Indigenous data sovereignty and governance are essential for upholding the rights of First Nations governments to achieve self-determination and self-governance and is also a key step in implementing the recommendations of the Truth and Reconciliation Commission of Canada (TRC) Calls to Action (TRC, 2015a) as well as the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP, 2008). The UNPFII (n.d.) notes that overcoming challenges concerning data collection requires a sustained and concerted effort by decision makers, governments and academics that includes Indigenous peoples as equal partners and active participants in the process:

> Indigenous peoples should fully participate as equal partners, in all stages of data collection, including planning, implementation, analysis and dissemination, access and return, with appropriate resourcing and capacity-building. Data collection must respond to the priorities and aims of the [I]ndigenous communities themselves. Participation of [I]ndigenous communities in the conceptualization, implementation, reporting, analysis and dissemination of data collected is crucial, at both the country and international levels. Indigenous peoples should be trained and employed by data-collection institutions at the national and international levels. Data collection exercises should be conducted in local [I]ndigenous languages to the extent possible and, where no written language exists, should employ local indigenous persons (as translators/interpreters as well as advisors) to assist in the collection process (UNPFII, n.p.).

In Canada, a series of guiding principles has emerged from these reflections in the form of the **First Nations Ownership, Control, Access and Possession (OCAP®) principles.** The OCAP®[45] principles provide a framework for promoting appropriate information governance related to data on First Nations communities. The principles were established in 1998 and have evolved under the First Nations Information Governance Centre (FNIGC) of Canada, which was formed in 2010. OCAP® respects the rights of First Nations to own, control, access, and possess information about their own peoples and stipulate that First Nations should be consulted by any researchers who work with or plan to work with First Nations data (FNIGC, n.d.). The FNIGC states that the OCAP® principles were developed in part to fill a gap in Western legal systems that doesn't account for "community rights and interests in their information" (FNIGC, n.d., p. 94).

The OCAP® principles are briefly described here:

Ownership. This principle refers to First Nations' collective ownership of "their cultural knowledge, data, and information" (FNIGC, n.d., p. 93).

Control. This principle asserts that First Nations have a right to control research, information management, data collection, and dissemination activities related to First Nations information.

Access. This principle asserts that First Nations have the right to access information about them, wherever it is held, and that they have the right to have say over how information about them is accessed by others.

Possession. This principle refers specifically to the physical control of data. The principle of possession facilitates First Nations ownership of data.

45 OCAP® is a registered trademark of the First Nations Information Governance Centre (FNIGC). Please refer to https://fnigc.ca/ocap-training/ for more information

Examples of First Nations data governance initiatives

Effective data governance plans and processes are essential tools for any data collection initiatives concerning Indigenous people, communities, and organizations. In addition to developing key data attributes such as accessibility, availability, quality, consistency, and security, the benefits of data governance for Indigenous data include:[46]

- Helping to rebuild Indigenous nations and communities, including governing institutions
- Promoting mutually beneficial and respectful Indigenous-government relationships
- Ensuring that any data and analyses that are produced benefit Indigenous communities

While there is no single correct or optimal model of Indigenous data governance, some promising initiatives involving Indigenous communities and governments have already been established in Canada.[45] As described below, these initiatives highlight the need for balancing Indigenous approaches and considerations (such as concerns about privacy and misuse of data) with the needs of government (such as the need to access and use high-quality, relevant data).

First Nations Data Governance Strategy (FNDGS). In 2020, the FNIGC released the First Nations Data Governance Strategy – Canada's first national strategy to ensure that First Nations people and communities will achieve data sovereignty. The strategy is First Nations-led and is based on community-driven and Nation-based collaborative approaches. The comprehensive report outlining the data governance framework and vision presents a phased implementation strategy along with eight main guiding principles (Community-driven and Nation-based; OCAP®; Relationships; Transparency and Accountability; Quality Community-Driven Standards and Indicators; Nation Building; Equity and Capacity; and Effective Technology and Policy) and nine key pillars for action.[47]

BC First Nations' Data Governance Initiative (BCFNDGI, BC, Canada). The BC First Nations' Data Governance Initiative (BCFNDGI) is a comprehensive, community-driven approach to data governance and sovereignty in British Columbia that seeks to enhance the capacity of First Nations Governments to control and own their data while also realigning provincial and federal systems to better promote and invest in First Nations' well-being.[48,49] The initiative is recognized as "leading edge" due to its collaborative approach that unites First Nations governments, organizations, and partners across the province along with dedicated political leadership from provincial and national governments – all working towards a shared goal of improved well-being for First Nations through effective data governance.[47,50]

Given the broad scope of the initiative and the range of partners involved as well as the long-term vision of transformative change, a phased approach was taken to develop and implement the BCFNDGI through several stages over five years (2012–2017) as set out in the strategic framework;48 and work to achieve their goals is still ongoing. For example, the BCFNDGI is currently working to establish a BC First Nations Data Centre to serve BC First Nations Governments. Other recent initiatives include a variety of pilot projects carried out across a selection of First Nations communities to test the various data governance tools and systems; a series of data governance forums in 2016; and a series of information and knowledge-sharing sessions in 2021 to assist BC First Nations in building capacity in data and information governance.[51,52]

The regional approach being developed in BC will also help to support broader provincial and national data governance goals, such as the national First Nations Data Governance Strategy (FNDGS), which includes the establishment of regional data governance centres across the country.[49] This work is overseen by the First Nations Information Governance Centre (FNIGC), a federally incorporated non-profit First Nations organization committed to providing data to improve the health and well-being of First Nations people across Canada and ensuring that every First Nation will achieve data sovereignty.[49]

Common Surveillance Plan Initiative: First Nations of Quebec and Labrador Health and Social Services Commission (FNQLHSSC, Quebec, Canada). The FNQLHSSC is a non-profit organization responsible for supporting Quebec First Nations and Inuit communities in developing and implementing culturally appropriate preventive health and social services programs and assisting

them in gaining greater control over data and information concerning First Nations peoples.[53,54] In recognition of the unique characteristics and needs of Quebec First Nations and the significant variance in existing health surveillance systems in place across the country, in 2009 the FNQLHSSC began the process of creating a health surveillance plan specific to the First Nations of Quebec, called the Common Surveillance Plan.[53] The plan had two primary aims: 1) to allow Quebec First Nations to track the health of their population and obtain a picture of their overall health status, as well as trends and patterns; and 2) to develop health indicators specific to First Nations communities which will allow better surveillance of First Nations health determinants.[53] Importantly, these indicators are focused more on holistic quality of life and well-being, such as values, morale, and spirituality, rather than traditional Western approaches to the determinants of health.[53] However, selected indicators will also be tied to existing data reporting mechanisms to allow for comparisons with other jurisdictions and for reporting to federal, provincial, and territorial governments.

Data sources for the surveillance plan include the Canadian Census, information from administrative records, as well as regional surveys.[55] As most of this data is stored in Quebec government-owned and controlled databases, the Common Surveillance Plan identified the need to negotiate data agreements with governments and each community to govern access and the release of data in accordance with the principles of Ownership, Control, Access and Possession (OCAP®).[53,54] By creating a practical tool that can be utilized in a common way by all intended communities, the plan will ultimately enhance the capacity of individual First Nations to develop their own community health plans and activities by providing resources and access to reliable data.[53]

When considering data sources for decisions involving Indigenous populations, it is critical to keep in mind that "[d]ata is inherently political and can help identify priorities, set targets, and hold government accountable" (McBride, n.d., p. 2). As history has shown, [m]any First Nations people and communities have experienced data being used for political purposes, but not their own" (McBride, n.d., p. 2). Typically, "[t]he content and purposes of data have historically been determined outside of First Nations communities (Otim, 2015), and the misuse of data has led to situations of misappropriation and broken trust" (McBride, n.d., p.2). The solution to "irrelevant and pathologizing data" according to McBride (n.d.) is "oddly, more data...that is developed by and with and for communities, data that reflect Indigenous worldviews, and data that is both relevant to communities and agreeable to policy makers" (p. 2).

The growing support and shift towards evidence-based policy making is "a welcome change from the status quo, particularly for First Nations policy, as the use of meaningful data allows for decisions that are based on evidence rather than external value judgments (McBride, n.d., p. 2; Otim, 2015). When created, collected and used correctly, data has the power to provide First Nations with "a way to bring evidence to issues that could have otherwise been ignored. When communities become their own data stewards, they can take on a leading role in the direction of their community wellbeing and in the very definition of that well-being" (McBride, n.d., p. 2). Data should never create inequality in society, but rather "highlight inequality and bring an evidence-based lens to policy making. Data provides baselines and benchmarks which allow for measurements of change over time and can be used...to develop solid policies and programs effectively, to demonstrate accountability, and to be transparent to their citizens" (McBride n.d., p. 2; Steffler, 2016, p. 149).

Summary: Opportunities for overcoming the challenges of using administrative data

Overcoming the challenges of using child welfare administrative data involves "a great deal of communication, relationship building, tolerance for bureaucratic hurdles, persistence and patience" (Green et al., 2015, p. 48). A search of the literature revealed a series of specific strategies when used in concert can help to address issues with respect to data collection; data quality; the sharing and linking of data; access; and administrative data structures and systems.

Consideration of the use of administrative data for decision making requires acknowledging both advantages and limitations of using this particular data source. Administrative data, often referred to as a by-product of government services, is considered to be a largely untapped, but information rich resource for decision makers. It has the power to offer decision makers the necessary insight and information for evidence driven decisions and policies that address the challenges and struggles of vulnerable children and families involved in Canada's child welfare system. Administrative data is a cost-efficient source of data, provides a high level of detail, allows for longitudinal research, minimizes the burden on respondents, and allows for the sharing and linking of data with other data sources. Although promising, overemphasis on the benefits of using administrative data must be tempered with a degree of caution as this source of data is not without its share of challenges concerning data collection methods, data quality, the sharing and linking of data, accessibility due to ethical, privacy, and confidentiality concerns, and administrative data structures and systems, all of which are exacerbated by Canada's decentralized and highly fragmented child welfare system. Overcoming these limitations will require a great deal of communication and relationship building, a thorough and clear understanding of the administrative program and its constituent parts, addressing ethical, privacy and confidentiality issues early in the process to ensure access and minimize any potential risks to participants, and finally, keeping in mind the central reason for the existence of administrative programs and records.

Respect First Nations data sovereignty and governance. Beginning any data-seeking task related to First Nations people ought to prioritize First Nations data governance principles related to this data. Seeking guidance from communities regarding access to and use of data for decisions made about these communities is inherent to respecting principles of First Nations data governance (FNIGC, 2020; UNDRIP, 2008).

Establish and maintain relationships with providers of administrative records. Establishing and maintaining relationships with providers of administrative records at the beginning and throughout the process ensures: that users of administrative records are aware of any changes that may impact the data being collected (Statistics Canada, 2019, n.p.); constant feedback between the supplier and user of the administrative records regarding any weaknesses found in the data that can help suppliers of the data to improve the quality of the administrative source (Statistics Canada, 2019, n.p.); and an increased level of trust between parties involved (Green et al., 2015, pp. 42–43).

Understand the origins of the administrative program. Having a good understanding of the context under which the administrative organization established the administrative program (e.g., legislative framework, objectives, and needs) is critical because it impacts the coverage of administrative records along with the contents, key concepts and definitions, the frequency and timeliness, the quality of the recorded information, and stability over time (Statistics Canada, 2019, n.p.). In situations when each province manages its own administrative program, it is important for users of administrative records to pay extra attention to the consistency of key concepts and data quality when there are multiple sources of administrative data (Statistics Canada, 2019, n.p.).

Address ethical, privacy, and confidentiality issues. Ensuring access to administrative files requires that ethical, privacy and confidentiality issues are addressed very early in the process. This usually involves a thorough understanding of the legal framework governing the use and sharing of administrative data as well as securing of agreements that allow for the use and sharing of the data while minimizing any potential risks to participants (Green et al., 2015, p. 42).

Acknowledge the purpose of administrative records. It is critical to keep in mind the central reason for the existence of administrative records: they were put into place for administrative purposes, typically for the delivery of services to the public. It is unlikely that applications outside their original scope were taken under consideration (Statistics Canada, 2019, n.p.). For this reason, it is suggested that decisions to utilize administrative records must always be preceded by "an assessment of such records in terms of their coverage, content, concepts and definitions, the quality assurance and control procedures put in place by the administrative program to ensure their quality, the frequency of the data, the timeliness in receiving the data and the stability of the program over time" (Statistics Canada, 2019, n.p.).

II. Data Availability

Child Welfare Compensation Categories: Data Availability

Overview of approach

In order to assess the availability and quality of administrative data that could help in identifying eligible claimants under the *2019 CHRT 39* compensation categories, a framework detailing the types of information needed to determine eligibility under the child welfare compensation categories is presented.

The framework includes a list of data fields, that **if available and of high quality**, could assist in the process of assessing claim eligibility under the CHRT child welfare compensation categories (Table 2.1, see following page). It is important to note that the proposed data fields which are matched to the compensation categories in the tables below were based on the project team's understanding of the compensation categories as defined by *2019 CHRT 39*. Given that these compensation categories are currently under negotiation, the eligibility requirements (and related fields of interest) are expected to change.

Once we established the combination of data fields that was necessary to operationalize the compensation categories, we identified which **administrative data sources** (both at a national and jurisdictional level) collected this information during the relevant time periods. We then identified and contacted respondents who had knowledge about these data sources and asked them questions about the availability, completeness, and accuracy of the proposed data fields.

Data quality was assessed using three considerations:

- **Data availability** is an assessment of whether a data field is available and whether it can be retrieved.
- **Data completeness** is an assessment of the comprehensiveness and wholeness of data. Low completeness means that there is missing, or the "unknown" category is widely endorsed data.
- **Data accuracy** is an assessment of whether the data value is consistently interpreted as intended

In addition to an evaluation of data quality, we also determined the **applicability** of data – the ability of the variable to determine or assist with operationalizing the compensation classes.

The results of our outreach to key informants regarding the availability, completeness, accuracy and applicability of information available on the child welfare compensation categories is detailed on the following pages.

Table 2.1 Information of interest to help identify claimants under the CHRT child welfare compensation categories

Information of interest			CHRT child welfare compensation categories		
			First Nations children **living on reserve or in the Yukon placed** between 2006-present	**First Nations** children **living on or off reserve placed between 2007 and 2017** in order to receive essential services*	**First Nations** parents or grandparents **of children eligible for compensation**, unless they abused their child**
INFORMATION ON CHILD AND CAREGIVER	Can the child in out-of-home placement be identified?	Child Name (Family Name, Given Name)	X	X	
		Child Date of Birth	X	X	
		Child Indian Registration Number	X	X	
	Is the child First Nations?	Child's First Nations identity	X	X	
	Child lives on-reserve?	Child residence on/off reserve	X		
	Can the caregiver at the time of the removal be identified?	Caregiver Name (Family Name, Given Name)			X
		Caregiver Indian Registration Number			X
	Is the caregiver First Nations?	Caregiver's First Nations identity			X
INFORMATION ON PLACEMENT	When was the child placed?	Dates of Start/End placement	X	X	
	Child placed outside of their home and community?	Caregiver's address at time of removal	X	X	
		Address of placement	X	X	
	Child placed outside of their extended family?	Type of placement (specify if includes kinship care)	X	X	
	Child placed because of abuse and/or neglect perpetrated by caregivers?	Type(s) of investigated maltreatment			X
		Substantiation or verification level (maltreatment and risk)			X
		Alleged perpetrator			X
		Reason for placement			X
	Child placed in order to receive essential services?	Child placed to receive essential services		X	

** This compensation category is both a child welfare and Jordan's Principle compensation category*
*** Identifying parents and caregivers is dependent on identifying the index child*

Data available at ISC: FNCFS Program

The FNCFS Program at ISC "provides funding to First Nations child and family services agencies, which are established, managed and controlled by First Nations and delegated by provincial authorities to provide prevention and protection services. In areas where these agencies do not exist, ISC funds services provided by the provinces and Yukon but does not deliver child and family services. These services are provided in accordance with the legislation and standards of the province or territory of residence."[1]

The FNCFS program funds child prevention and protection services for First Nations children and families that are on-reserve or ordinarily resident on-reserve. The data holdings pertain to information on child maintenance costs that are provided on a monthly basis to ISC by First Nations Child and Family Services (FNCFS) agencies or Provincial/Territorial governments when First Nations families on reserve are not serviced by an FNCFS agency. The FNCFS program is administered at a regional level in the following regions: Alberta, Atlantic (New Brunswick, Nova Scotia, Newfoundland and Labrador, and PEI), British Columbia, Manitoba, Ontario, Quebec, Saskatchewan, and the Yukon. Please see Appendix D for a list of FNCFS-funded agencies (FY 2013-2014 to present) and Appendix E for a list of FNCFS agency-band associations (FY 2013-2014 to present).

In fiscal year 2013-2014, the FNCFS program implemented a national information system to store child maintenance data funded by ISC. Prior to that date, FNCFS child maintenance data was decentralized and region-specific. This section starts by describing data available through the national information management system (from FY 2013-2014 onwards), before analyzing the data that is held at a regional level at ISC between FY 2005-2006 to 2013-2014.

Data from fiscal year 2013-2014 onwards

Information on child maintenance data from all regions starting in FY 2013-2014 (i.e., April 1st, 2013) is stored in data fields within a centralized database, called the **Information Management System** (IMS) at ISC. It is an in-house system that was developed for the FNCFS.

The data dictionary for the FNCFS IMS is available in Appendix F and the associated drop-down response options can be found in Appendix G. The project team created a template requesting information regarding the availability, completeness, and accuracy of the specified data fields. This template was shared with ISC staff familiar with the administrative data system currently in use (from fiscal year 2013-2014 onwards). Responses to this template are available in Appendix H. Using these documents, the project team has provided an overview of the availability of data held in the IMS as they relate to the CHRT compensation categories in a table available in **Appendix I**.

The utility of the information available from the **ISC FNCFS program in FY 2013-2014 onwards** to help identify claimants eligible for compensation under the child welfare compensation categories is summarized below:

Can the child be identified?

Child name, date of birth and *Indian Registration Number* are all collected by the IMS, with high levels of completeness. Some minor typos were noted for the child's name and date of birth when the child was not registered for status.

Is the child First Nations and does he or she live on-reserve?

While data regarding child's *First Nations identity* or *residence on-reserve* is not listed as a data field in the IMS, FNCFS child maintenance data only concerns First Nations children ordinarily resident on-reserve who are placed in out-of-home care.

Issues with applicability to compensation categories*:* Some small differences in practices for determining residence on or off-reserve were identified across regions. For example, in Manitoba it is where the child is taken into care that determines who funds services. Furthermore, the definition of First Nations children used by the FNCFS program does not include "individuals who have been recognized as citizens by their First Nations" but are not eligible for status.

1 Indigenous Services Canada. (n.d.). *First Nations Child and Family Services.* https://www.sac-isc.gc.ca/eng/1100100035204/1533307858805

Can the caregiver(s) at the time of removal be identified and are they First Nations?

No information on the caregiver (*name*, *date of birth*, *Indian Registration Number*, *First Nations identity*) is included in the national IMS. This information may be available from child maintenance forms accessible through ISC regions.

When was the child placed?

The days during which a child had a child maintenance expense (*Start Pay Date* and *End Pay Date*), are mandatory fields in the IMS and are considered as having a high level of accuracy.

Issues with applicability to compensation categories**:** Importantly, these data fields are attached to the *payment of a placement* and do not provide enough specificity to determine if a child moved between different placements during a spell in care. They do, however, provide an estimate of the length of time in care starting in FY 2013-2014. If a child was in care prior to that date, this information would need to be linked across databases.

Was the child placed outside of their community?

The child or parent's address of residence at the time of removal and the address of placement can be compared to determine if a child was placed outside of their community. Information on the address of residence and the address of placement is not available in the IMS.

Was the child placed outside of their family?

If collected, placement type could provide an indication as to whether the child was placed in kinship care (i.e., with extended family) or not. The type of placement information, including whether the child was placed in kinship care, is available for all ISC regions except Manitoba.

Issues with applicability to compensation categories: It is important to note that the types of placement and definition of kinship care vary considerably across provinces. In many cases, kinship care includes placement with close friends or neighbours. Additional details are provided in the section on data available from child welfare agencies later in the report.

Why was the child placed?

Information on reason for placement is unavailable in the IMS.

As such, the information collected by the FNCFS program starting in FY 2013-2014 through the IMS can help identify children eligible for compensation. However, the data fields collected by the IMS do not include certain types of information relevant to the more criteria specific identification of children and caregivers under the current understanding of the compensation categories, such as: **the reason for placement** to determine if a child was placed because of abuse, neglect, or other contextual factors; **caregiver address *and* placement address** to determine if a child was placed outside of their community; **caregiver name *and* Indian Registration Number** to identify the caregiver at the time of removal.

The project team has contacted a purposive sample of child welfare agencies across Canada to determine whether reason for placement, caregiver and placement address and caregiver name and IRS number (or related information) are available at an agency-level. The results of this information gathering exercise can be found below in Data available at child welfare agencies on p. 57).

Data prior to fiscal year 2013-2014

Prior to the implementation of the IMS system for use by the FNCFS program, information on FNCFS was collected at the regional level using reporting forms which varied across regions and across fiscal years. Data prior to fiscal year 2013-2014 is not centralized. We requested two types of information regarding historical regional FNCFS data holdings: 1) information on the availability and quality of data fields collected; and 2) information on the format (e.g., paper, electronic, searchable database) in which the data is currently stored. The information provided to us is detailed in the sections below.

Information on the data collected by child welfare maintenance forms across ISC regions

In order to determine the availability of data fields collected prior to FY 2013-2014, **sample child maintenance reporting forms** used by the different ISC regions' FNCFS staff between fiscal year 2005-2006 and fiscal year 2012-2013 were provided to the project team for their assessment and documentation.

We have summarized the data fields available in reporting forms that relate to the CHRT compensation categories in tables available in **Appendix J**. It is important to note that these tables only provide information on the *availability* of certain data fields. They do not provide any information on the *completeness*

(i.e., the percentage of missing child maintenance reports and missing data values), nor the *accuracy* of the information (i.e., the extent to which the information is correctly reports the information). The project team has asked for more details regarding the completeness and accuracy of data prior to fiscal year 2013-2014, which was not provided to us in time for this report. Furthermore, no information was provided to the project team regarding child maintenance forms prior to FY 2005-2006.

The utility of the information collected by **ISC FNCFS regions between FY 2005-2006 and FY 2013-2014** to help identify claimants eligible for compensation under the child welfare compensation categories is summarized below:

Can the child be identified?

Child name and *date of birth* was systematically collected across regions, except for Atlantic Region. Specifically, the child's date of birth was not available in the sample forms provided by the Atlantic region from FY 2005-2006 to 2008-2009 and FY 2010-2011 to 2012-2013. Furthermore, the 2008-2009 and 2010-2011 forms from the Atlantic Region collected information about the client number, rather than the client's name. For these fields to be used to identify children, a link between client number and name would need to be provided.

There was variability across regions in the collection of the child's *Indian Registration Number*. The regions of Quebec, Ontario, Saskatchewan, and BC collected the child's Indian Registration Number for all FYs examined (FY 2005-2006 to 2012-2013). In Alberta and Manitoba regions, only the Treaty or Band number was collected from FY 2007-2008 to 2009-2010 and from FY 2005-2006 to FY 2007-2008 respectively. The child's Indian Registration Number was not collected in the Yukon region until FY 2012-2013 and was unavailable in the forms provided by the Atlantic region for FYs 2006-2007, 2008-2009, 2010-2011, and 2012-2013.

Is the child First Nations and does he or she live on-reserve?

Child maintenance forms are used to document maintenance costs for *First Nations children* ordinarily *resident on-reserve*. Some of the child maintenance forms reviewed specifically asked about the *child (or parent's) residence on or off reserve*. Namely, this information is available in forms from Alberta region from FY 2010-2011 to 2012-2013; and forms from BC, Ontario, and Saskatchewan regions from FY 2005-2006 to 2012-2013.

Can the caregiver(s) at the time of removal be identified and are they First Nations?

The parent or guardian name is available in some child maintenance forms. Specifically, this information was available in child maintenance forms in Atlantic region in FY 2011-2012, in Manitoba region from FY 2006-2007 to 2012-2013, as well as in BC, Ontario, and Saskatchewan for FY 2005-2006 to 2012-2013.

When was the child placed?

Dates of placement were usually available. The regions that did not have this information were the Yukon (all FYs examined), Saskatchewan (FYs 2005-2006 and 2006-2007), and the Atlantic region (although it is available in FY 2009-2010).

Issues with applicability to compensation categories: As with the information from the IMS, the date of start and end of placement do not provide enough information to determine if a child moved between different placements during a spell in care. Placement start and end date could provide an indication of length of time in care, but information would need to be reliably collected and stored across all FYs for it to be usable.

Was the child placed outside of their community?

The child or parent's *address of residence* at the time of removal and the *address of placement* can be compared to determine if a child was placed outside of their community. The parent's address was only collected by BC and Ontario regions. However, no information on address of placement was found.

Issues with applicability to compensation categories: Given that address of residence cannot be compared to address of placement, this information cannot be used to determine placement outside of a community.

Was the child placed outside of their family?

If collected, *placement type* could provide an indication as to whether the child was placed in kinship care (i.e., with extended family) or not. Placement type was available in Alberta (FY 2007-2008 onward), the Atlantic (FYs 2009-2010 and 2011-2012), British Columbia (FY 2006-2007 onward), Manitoba (FY 2005-2006 and FY 2012-2013), and from FY 2005-2006 to 2012-2013 in Ontario, Quebec, and Saskatchewan.

Issues with applicability to compensation categories: As noted previously, differences in the definitions used by various provinces to categorize placement types minimizes the ability to use this data field across regions.

Why was the child placed?

Information on *reason for placement* is unavailable in the forms obtained, except for in one form used by Manitoba ISC region.

As such, according to the sample reporting templates we received, the variables collected within the ISC regions between FY 2005-2006 and 2012-2013 vary considerably across regions and across different years. This complicates the ability to use this data in a systematic way to identify claimants

Format in which historical FNCFS data is currently stored across ISC regions

Details provided on the current format of historical child maintenance data kept by FNCFS ISC regions prior to FY 2013-2014 is detailed in Table 2.2 **below**.

Table 2.2 shows that data prior to FY 2013-2014 is currently stored in many different formats (including paper records, electronic databases, and excel spreadsheets). It will be important to find a way to centralize this information to facilitate claimant identification.

Additionally, FNCFS staff underlined the following limits on information collected prior to the implementation of a national information management system that need to be taken into consideration when determining the usability of these data sources to identify claimants:

- "Legacy systems have been decommissioned and the data they stored may be difficult to retrieve.
- Precise information may not have been captured in early years, making it difficult to determine items such as the number of placements and time in care. Manual counts may be required.
- Reports have been archived and are now stored off-site.
- Older records or closed files would be subjected to Treasury Board and Departmental policies regarding physical records retention, and therefore may have been disposed of in accordance with those policies."[2]

Table 2.2 Format of historical child maintenance data kept by FNCFS ISC regions prior to FY 2013-2014

Region	Overall description	Data Source (e.g., existing data base, case file review, etc.)
Alberta Region	• Historical data is captured in paper records (including fax), MS Excel spreadsheets, TIFs and scanned PDFs. (Some reports are available in more than one format). • Electronic-retention was not available for a number of historical fiscal years. • Not all data was saved due to the sensitivity of the information (names and details of children).	• Archived paper records • GCDocs[3] • Grants and Contribution Information Management System (GCIMS)
Atlantic Region	• Historical child maintenance data is available between 2005 to 2013. • Limited data available between 1991 to 2004. • This includes paper copies for earlier years and electronic files (scanned PDF or MS Excel in GCIMS or GCDocs.	• Archived paper records (Library and Archive Canada) • Archived paper records (Regional Office) • Comprehensive Integrated Document Management (CIDM)[4] • Electronic files in GCDOCS

(continued on following page)

2 Document provided by FNCFS staff at ISC
3 GCDocs is the Government of Canada's solution for information management of electronic and paper documents and records.
4 Comprehensive Integrated Document Management (CIDM) system is the former document management system used by the Department

Table 2.2 Format of historical child maintenance data kept by FNCFS ISC regions prior to FY 2013-2014 *(continued)*

Region	Overall description	Data Source (e.g., existing data base, case file review, etc.)
British Columbia Region	• BC FNCFS data (from delegated agencies) is available from 2011-2012 in an electronic format. • BC data (from the Province - MCFD) is available from 2012-2013 in an electronic format. • BC FNCFS data (from delegated agencies) from 1996-1997 to 2010-2011 was collected in a regional dBase system. • BC data (from the Province - MCFD) from 2011-2012 was collected in a regional dBase system. • Records prior to 2010-2011 may not be accessible in an electronic format.	• BC regional system • BC regional dBase system (decommissioned)[5] • GCDocs (as scanned documents) • Archived paper records (TBD by Information Management (IM) team)
Manitoba Region	• Historical child maintenance data starting approximately in 07/08 may have records on an agency-by-agency basis identifying each child. • Prior to 07/08, would need to be retrieved from archived records (National Archives). • A large volume of paper records, scanned paper records and a limited number of electronic files (MS Excel spreadsheet) may exist.	• Archived paper records (National Archives) • Electronic files
Ontario Region	• Historical data are available from fiscal year 2000-2001 and forward. • Prior to 1998, the Ontario Region did not have a centralized approach to capturing and maintaining data.	• ON region database • MS Excel spreadsheets in GCDOCS • ON region database (Older electronic file format)
Quebec Region	• Historical child maintenance data is available from the early to mid-2000s in the QC regional decommissioned database. • Data from 1991 to 1995-1996 are available as hard copy files.	• QC region decommissioned database (accessible to NCR in an electronic format – MS Excel spreadsheets). • Regional consultation needed for details of the data • Archived paper records
Saskatchewan Region	• Historical child maintenance data is available from the decommissioned SK regional system. • Approximate start date of data is 1995. • Data is based on FNCFS agencies that were operational and delegated at that time. • The Province of Saskatchewan has access to data through their own database for FN children in care not serviced by a delegated agency.	• SK region decommissioned database (accessible to NCR in an electronic format – MS Excel spreadsheets). • Regional consultation needed for details of the data • Province of SK database • Archived reports offsite
Yukon Region	• Historical data are available in spreadsheets, scanned documents, hard copies and in various template formats. • A limited number of reports are available in an electronic format.	• Comprehensive Integrated Document Management (CIDM) • Offsite archived reports (hard copies)

Source: *Information provided directly by FNCFS staff at ISC*

5 DBase is a database management system (DBMS) that runs on a Windows platform.

Conclusion

The FNCFS program at ISC collects some data that could be used to help identify eligible claimants under the child welfare compensation categories. Specifically, identifying information (name, date of birth) of First Nations children ordinarily resident on-reserve who were placed in care is collected across regions for the years examined (FY 2005-2006 to present).[6] This could provide an efficient way to identify the group of children living on-reserve or in the Yukon who are eligible for compensation under the child welfare compensation categories. Identifying information regarding the caregiver at the time of removal is not available following FY 2013-2014 but may be available through child maintenance and/or eligibility forms collected by regions. More detailed information on the reason for placement, the number of moves in care, and placement outside of the community is not available at the FNCFS program across all years. If this information is deemed to be necessary to identify claimants, child welfare agencies will need to be contacted to provide this level of detail.

6 The completeness of this information cannot be ascertained for FYs prior to 2013-2014

Data available at sampled child welfare agencies and authorities

Methodology

In order to ensure that all potential data sources were documented we reviewed information systems from child welfare authorities in provinces and territories across Canada. Given the number of child welfare authorities in which child welfare information is documented, our goal was to *sample* agencies across Canadian jurisdictions using different information systems.

We captured information about data in:

1. Mainstream or child welfare authorities not specifically delegated to serve First Nations communities by surveying the information system(s) used in each province and territory, and
2. First Nations agencies, if they used a different information system than the province, where possible.

First, we contacted individuals known to the research team in each jurisdiction. These contacts typically shared information on the data systems used in the jurisdiction and guidance on a sampling approach, including agency contacts. In many cases, they connected us with First Nations child welfare directors' roundtables in the province or territory. In some jurisdictions, an informational presentation on the project was requested and facilitated further discussions with appropriate child welfare authorities. The one-page information sheet we developed to help facilitate our outreach is available in Appendix M.

Cumulatively, we interviewed approximately 150 people representing all provinces, the Yukon, and the Northwest Territories.[7] Using a template table we developed (see Appendix N), we held one or two meetings to ensure we connected with someone familiar with the data holdings in the jurisdiction to discuss the template. In some cases, respondents preferred to fill in the template themselves, or to finish it and send it back after an initial conversation with us. These meetings took place on Zoom from February through December 2021, with the bulk of information collected during the summer months. We have not included the names of First Nations agencies to protect their confidentiality and ownership of information about their data holdings.

Given that we reached out to *sampled* child welfare agencies, the information provided cannot be considered as being representative of the whole province, unless otherwise specified. Furthermore, the level of detail regarding the availability, completeness, and accuracy of variables collected is contingent upon the information available to respondents to answer our questions. In order to respect the confidentiality of the children and families identified in the data systems, the project team **did not have direct access** to the data sources and could therefore not verify the responses provided by the key respondents. This process allowed us to document important information without overburdening agencies who will likely be involved with supporting claimants to receive compensation upon implementation.

The following sections document the structure of child welfare and types of administrative data systems used by different jurisdictions before providing an overview of the results of discussions with sampled agencies regarding the availability and quality of their data. The full list of tables documenting the availability and quality of data in sampled child welfare authorities and agencies across Canada, as they relate to child welfare compensation categories is available in **Appendix P**.

7 Nunavut is not included in the CHRT compensation order and was therefore not included in our outreach.

Overview of structure of child welfare and data systems used by each jurisdiction

Alberta

Structure of child welfare in Alberta

The Ministry of Children's Services is responsible for child protection and related services (foster care homes, child benefit, supports) in Alberta. Child welfare is legislated by the *Child, Youth and Family Enhancement Act*.

There are 48 First Nations in Alberta. Of these, in fiscal year 2018-2019, 39 bands receive FNCFS services delivered by the 17 Delegated First Nations Agencies (DFNAs). The remaining 9 bands receive services through provincial offices. There are 86 provincial offices in total. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Alberta

Overview

In Alberta, the Performance Analysis and Improvement Unit under the Ministry of Children's Services is responsible for extracting and analyzing child welfare administrative data in the province. All mainstream and First Nations child and family services agencies use the same information system to document involvement with these agencies. The current case management system is called the **Child Intervention Case Information Online system (CICIO).** Prior to CICIO, the Child and Youth Intervention Module (CYIM) was used between 1996 and 2014. The information from CYIM was gradually migrated as the CICIO was implemented between 2011 and 2014. The Child Welfare Information System (CWIS) was used before CYIM.

Outreach

In Alberta, given that the province is responsible for maintaining the data from both non-First Nations and First Nations child welfare agencies, we reached out to the Ministry of Children's Services to ask about the availability and quality of data as they relate to the CHRT compensation categories.

British Columbia

Structure of child welfare in British Columbia

The Ministry of Child and Family Development (MCFD)'s Director of Child Protection is responsible for child protection and related services (e.g., mental health, services or children with special needs, and adoption in British Columbia). Child protection is legislated by the provincial *Child, Family, and Community Service Act.*

There are 199 First Nation bands in British Columbia. Of these, in fiscal year 2018-2019, 112 bands received FNCFS services through 18 Delegated Aboriginal Agencies (DAAs) funded through the FNCFS program. The other 87 bands and children off reserve received child welfare services through 429 MCFD offices throughout the province. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in British Columbia

Overview

In British Columbia, the Modelling, Analysis, and Information Management (MAIM) department of the MCFD is responsible for extracting and analyzing child welfare data in the province. Child welfare data collected by Ministry agencies as well as many DAAs are stored in the **Integrated Case Management System (ICMS)**. The ICMS was implemented in 2012, prior to which the **Management Information System (MIS)** was used. All archival information from MIS was migrated into ICMS in 2014.

Some DAAs currently use **Best Practices**, another software tool. Some agencies using Best Practices also interface with ICMS. The list below provides information on which DAAs currently use Best Practices

Table 2.3 List of provincial and delegated agencies in BC that receive funding from FNCFS and the name of the administrative data system they use[8]

CFS agency name	Current information system
Ayas Men Men Child and Family Services	Best Practices
Carrier Sekani Family Services	ICMS
Denisiqi Services Society	ICMS
Fraser Valley Aboriginal Children And Family Services Society (VACFSS)	ICMS
Gitxsan Child and Family Services Society	ICMS
Heiltsuk Kaxla Society	ICMS
Knucwentwecw Society	ICMS
Ktunaxa/Kinbasket Child and Family Services Society	Best Practices
Kwumut Lelum Child and Family Services Society	ICMS
Lalum'utul'Smun'eem Child and Family Services	Best Practices
Nezul Be Hunuyeh Child and Family Services Society	ICMS
Nil/Tuo Child and Family Services Society	Best Practices
Nlha'7 Kapmx Child and Family Services Society	ICMS
Northwest Inter-Nation Family and Community Services Society	ICMS
Scw'Exmx Child and Family Services Society	ICMS
Secwepemc Child and Family Services Agency	Best Practices
Spallumcheen Child and Family Services	ICMS
Usma Nuu-chah-nulth Child and Family Services	Best Practices
Ministry of Child and Family Development[9]	ICMS

Outreach

In British Columbia, the province is responsible for the data collection related to non-First Nations agencies and many First Nations child welfare agencies. We contacted officials at the Ministry of Child & Family Development to ask about the availability and quality of data as it relates to the CHRT compensation categories. We also spoke with a First Nations agency in British Columbia who uses the ICMS.

Manitoba

Structure of child welfare in Manitoba

The Department of Families is responsible for child and youth services in Manitoba. The *Child and Family Services Act* and the *Child and Family Services Authorities Act* provide the legislative framework and mandate for child welfare services. Child welfare is administered through four Child and Family Services Authorities grouped by service population: First Nations (North and South division), Métis, and a General Authority (non-First Nations, non-Métis).

There are 63 First Nations bands in Manitoba. Of these, in fiscal year 2018-2019, all 63 bands received child protection services through 15 First Nations delegated agencies funded through the FNCFS program. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Manitoba

Overview

The information system used in the province by all four Child and Family Services Authorities is the **Child & Family Services Application system**. It is divided into the **Intake Module** (IM) and the **Child and Family Services Information System** (CFSIS). The Province of Manitoba maintains these databases and is responsible for housing and protecting the data.

Although IM and CFSIS are used by all child welfare agencies in Manitoba, usage varies across the province. Certain First Nations agencies in Northern Manitoba oppose the use of a provincial system to store information on children who are under federal responsibility and others cannot use the system because of limited access to internet. As a result, it is estimated that some agencies in Northern Manitoba have "between 40 and 85 per cent of the information missing on their caseloads."[10]

Outreach

In Manitoba, given that the province is responsible for maintaining the data from both non-First Nations and First Nations child welfare agencies, we reached out to contacts at the Department of Families to ask about the availability and quality of data as they relate to the CHRT compensation categories.

8 Based on information provided following the BC Director's Forum in June 2021

10 Malone, K. (2016, July 27). "Manitoba seeks to close gaps in how children in care are tracked". *CBC Manitoba*. https://www.cbc.ca/news/canada/manitoba/cfs-computer-system-overhaul-1.3695800

New Brunswick

Structure of child welfare in New Brunswick

Child welfare in New Brunswick falls under the Child and Youth Services Branch of the Ministry of Social Development. The Division of Children, Families and Seniors oversees Child Welfare and Youth Services branch, which is further divided into two units: Child Welfare and Youth Services unit and Clinical Auditing and Child Welfare Training unit. The *Family Services Act* provides the legislative framework and mandate for child welfare services.

There are 15 First Nations bands in New Brunswick, most of which receive child welfare services from delegated First Nations agencies. In fiscal year 2018-2019, 7 First Nations agencies serve 13 First Nations bands. The remaining 2 bands (Tobique and Madawaska Maliseek First Nations) are served by the Ministry. There are 15 provincial child welfare offices in total. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in New Brunswick

Overview

Child welfare data in the province are extracted and analyzed through the Clinical Auditing & Training Unit. The main information system in the province is **New Brunswick Families**, which is a structured decision-making case management tool used by the Ministry of Social Development and many First Nations agencies since 2004. All First Nations agencies have access to NB Families, and some use it in tandem with other information systems. In addition to NB Families, **RedMane** is used by three First Nations agencies. An additional five agencies are either in training or preparation to implement RedMane. One agency uses **4D Case Manager** which has been customized for that agency. We are aware of one agency that does not use an electronic information system and documents information **using written case notes**.

Table 2.4 List of provincial/delegated agencies in New Brunswick and the name of the administrative data system they currently use

Agency Name	Current information system
Eel River Bar Child & Family Services	NB Families
Elsipogtog Child & Family Services	4D Case Manager
Esgenoopetitj Child & Family Services	NB Families & exploring RedMane
Kingsclear Child & Family Services	NB Families & training for RedMane
Mig'maq Child and Family Services of NB	RedMane & NB Families (& Paper files)
Oromocto Child & Family Services	RedMane & NB Families
St. Mary's Child & Family Services	RedMane & NB Families
Woodstock Child & Family Services	Written case notes
Province of New Brunswick – Social Development[11]	NB Families

Outreach

In New Brunswick, as the provincial information system, NB Families, is available to all agencies and First Nations agencies use additional systems, we held conversations with provincial contacts as well as a First Nations agency using RedMane to ask about the availability and quality of data as they relate to the CHRT compensation categories.

11 Non-delegated (provincial) agency

Newfoundland and Labrador

Structure of child welfare in Newfoundland and Labrador

The Department of Children, Seniors and Social Development (CSSD)'s Child Protection Services is responsible for child welfare in Newfoundland and Labrador. Child welfare in Newfoundland and Labrador is legislated by the *Children, Youth and Families Act* (SNL 2018, c.C-12.32).

Two of the three First Nations bands in the province (Mushuau Innu First Nations and Sheshatshiu Innu First Nation) receive child protection services through the province. Miawpukek First Nation has its own child welfare agency. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Newfoundland and Labrador

Overview

In Newfoundland and Labrador, all child protection data is held by the Child Protection and In-care section of the CSSD and stored in the **Integrated Service Management** (ISM) system, which was implemented in 2018. Prior to this, from 2000 to 2018, the **Client Referral Management System** (CRMS) was used.[12] Information from the CRMS was migrated to the ISM. Before 2000, information would be available in paper files.

Outreach

In Newfoundland and Labrador, given that the province is responsible for maintaining the data from both non-First Nations and First Nations child welfare agencies, we reached out to provincial contacts to ask about the availability and quality of data as they relate to the CHRT compensation categories.

Northwest Territories

Structure of child welfare in the Northwest Territories

Child welfare in the Northwest Territories falls under the Department of Health and Social Services, Child and Family Services. The legislative framework for child welfare in the territories is the *Child and Family Services Act* (SNWT 1997, c 13). Child welfare services are delivered under three administrative bodies in the territories. In total, 34 agencies deliver child welfare services across the territory.

There are 26 First Nations bands in the Northwest territories. In contrast to other jurisdictions, funding for child welfare in the Northwest Territories comes through transfer payments from the federal Department of Finance directly to the provincial government, rather than through the FNCFS program directly to agencies.[13] Accordingly, there is no delegated agency status in the Northwest Territories and all services fall under the Department of Health and Social Services.

Child welfare data in the Northwest Territories

Overview

Responsibility for child welfare data in the Northwest Territories falls under the Department of Health and Social Services. The current information system used throughout the territory is called **Matrix-NT.** Matrix has been in place since October 2017. Prior to this, starting in 2000, the **CFIS** system was used. Information from CFIS has been migrated into the Matrix system and is available.

Outreach

Given the centralization of child welfare information in the Northwest Territories, we reached out to the Department of Health and Social Services, Child and Family Services to ask about the availability and quality of data as they relate to the CHRT compensation categories.

12 CRMS was implemented in Labrador in 2005.
13 Indigenous Services Canada. (2021). First Nations child and family services. Retrieved from https://www.sac-isc.gc.ca/eng/1100100035204/1533307858805

Nova Scotia

Structure of child welfare in Nova Scotia

The Department of Community Services is responsible for child and youth services in Nova Scotia. The Department of Community Services oversees Child, Youth and Family Supports which is responsible for adoption, foster care, child maltreatment intervention, prevention, early intervention, and residential care. The *Children and Family Services Act* provides the legislative framework and mandate for child protection services. These services are provided by four regional district offices and seventeen county and municipal Child Welfare Services offices.

There are 13 First Nations bands in Nova Scotia, that all receive child protection services from one delegated First Nations agency, Mi'kmaw Family & Children's Services of Nova Scotia. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Nova Scotia

Overview

Child welfare data in the province is analyzed by the Research & Statistics section, Department of Community Services. The information system used in the province by both the non-First Nations and First Nations agencies is the **Integrated Case Management** (ICM) system, which was put in place in 2009. Prior to 2009, agencies used an Access Database.

Outreach

In Nova Scotia, we contacted the Department of Families, who worked in concert with Mi'kmaw Family & Children's Services of Nova Scotia, to ask about the availability and quality of data as they relate to the CHRT compensation categories.

Ontario

Structure of child welfare in Ontario

The Ministry of Children, Community and Social Services is responsible for child welfare and protection, in Ontario. The *Child, Youth and Family Services Act* provides the legislative framework and mandate for child welfare services. 51 Children's Aid Societies, which are governed by Boards of Directors elected from local communities, provide child protection services throughout the province. Eleven of those agencies are mandated to provide services specifically to Indigenous communities (Indigenous Child and Family Well-Being Agencies).

ISC reimburses Ontario for the delivery of child and family services to First Nations children and families on reserve through the 1965 *Memorandum of Agreement Respecting Welfare Programs for Indians* (1965 Agreement). There are 136 First Nations bands in Ontario. In fiscal year 2018-2019, 13 delegated First Nations agencies served 105 First Nations bands and 38 mainstream Children's Aid Societies served the remaining 31 First Nations bands. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Ontario

Overview

The administrative data system currently used by provincial child welfare agencies in Ontario is the **Child Protection Information Network** (CPIN). Only one delegated First Nations agency currently uses CPIN. Nearly all other First Nations agencies use the legacy system **Penlieu**, except for Akwesasne Child and Family Services, which uses **Matrix**.

Table 2.5 List of provincial/delegated agencies in Ontario and the name of the administrative data system they use[12]

York Region Children's Aid Society*	Coyote	CPIN	2019

Outreach

We sampled two First Nations agencies to identify the availability of data in the information systems they use. We were provided with additional information regarding missing and unknown responses for Penlieu, CPIN, and Coyote through the Ontario Child Abuse and Neglect Data System (OCANDS) at the University of Toronto. OCANDS obtained data sharing agreements from three agencies to contribute non-identifying information about the availability of data through these information systems for the purpose of this project.

Prince Edward Island

Structure of child welfare in Prince Edward Island

The Ministry of Social Development and Housing is responsible for child protection services in PEI under the Department of Child and Family Services. The *Child Protection Act* provides the legislative framework and mandate for the provision of child protection services. These services are delivered via Child and Family Services offices.

There are two First Nations bands in PEI, Abegweit First Nation and Lennox Island First Nation, that both receive child protection services from one delegated First Nations agency, Mi'kmaq Confederacy of PEI. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Prince Edward Island

Overview

Child welfare data is managed by the Department of Family and Human Services. The **Integrated Services Management** (ISM) system, put in place in 2003, is used to store data collected by both provincial and First Nations agencies in PEI.

Outreach

In PEI, given that the province is responsible for maintaining child welfare data, we reached out to the Department of Family and Human Services to ask about the availability and quality of data that they hold as they relate to the CHRT compensation categories. It is important to note that, in PEI, there is a low number of Indigenous children in care (i.e., average of 5 Indigenous children entering care every fiscal year according to our contacts). Therefore, any manual search would likely be more manageable than in other provinces.

Quebec

Structure of child welfare in Quebec

The Directors of Youth Protection (DYP) under the Ministry of Health and Social Services (*Ministère de la santé et des services sociaux*) are responsible for child protection in Quebec, which is legislated under the *Youth Protection Act* (P-34.1) and *An Act Respecting Health and Social Services* (S-4.2). At present, there are 19 agencies in Quebec receiving funding through the FNCFS program.

In 2018-2019, of the total 28 First Nation bands in the province, 20 receive services from 15 First Nations agencies. The remaining eight bands receive child welfare services through *Centres intégrés de santé et de services sociaux* which operate under the Ministry but receive FNCFS funding. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Quebec

Overview

Child welfare data in Ministry agencies and most First Nations agencies are collected in the **Projet Intégration Jeunesse** (PIJ) system and are held in each of 18 socio-health regional levels within the province. Data specific to placements are held in the Système d'information sur les ressources intermédiaires et de type familiale (SIRTF) system which is linked to PIJ by a user ID. PIJ was developed in the early 2000s and was fully implemented in 2004. Select First Nations agencies have opted to use proprietary data systems. Kahnawake Shakotiia'takehnhas Community Services of the Mohawk Council of Kahnawá:ke has used **Penelope** (2012-present) and **Case Manager** (1998-2012). Akwesasne Child and Family Services (which is on the border with Ontario) uses a **Matrix** software system.

Table 2.6 List of provincial/delegated agencies in Quebec and the name of the administrative data system they use

Outreach

In Quebec, given that the province is responsible for maintaining most of the data from both non-First Nations and First Nations child welfare agencies, we reached out to a contact familiar with the mainstream system under the Ministry of Health and Social Services to ask about the availability and quality of data that they hold as they relate to the CHRT compensation categories.

Saskatchewan

Structure of child welfare in Saskatchewan

The Ministry of Social Services is responsible for child and youth services, including child protection, in Saskatchewan. The *Child and Family Services Act* provides the legislative framework and mandate for child welfare services. Service area offices (Regina, Saskatoon, Prince Albert) administrate and direct local agency offices. Delegated First Nations (FNCFS) agencies are administered by band-level offices and organized by treaty/region.

There are 70 First Nations bands in Saskatchewan. Of these, in fiscal year 2018-2019, nine received services from the Ministry of Social Services and 61 received services from 17 First Nations delegated agencies. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in Saskatchewan

Overview

Child welfare data in the province is managed by the Ministry of Social Services (MSS) and individual First Nations agencies. The Ministry uses a Structured Decision Making tool provided by **Linkin Case Management** to collect data on children in the child welfare system. The Ministry uses the Multi-Informational Database Applications System (MIDAS) to record payments to out-of-home care providers.

Although no specific information was available regarding the administrative systems used by First Nations (FNCFS) agencies in Saskatchewan, most FNCFS agencies use **RedMane**, and others use an independent system that they have created. Many First Nations agencies are transitioning from paper to electronic systems and some continue to use paper files (personal communication, MSS contact). Agencies that do not use Linkin need to follow certain guidelines that are presented in the Ministry of Social Services' Child Protection Services Manual. It specifies the information that must be collected by all agencies. It includes parents' names, children information, reason for involvement (subsection(s) of Section 11 mandates), case contacts, as well as "when children come into care and when they are returned home" (p. 437).[17]

16 Agencies with an asterisk are non-delegated (provincial) agencies

17 Ministry of Social Services. (2021). *Child Protection Services Manual.* https://pubsaskdev.blob.core.windows.net/pubsask-prod/88038/Child%252BProtection%252BServices%252BManual%252BAugust%252B2021.pdf

Outreach

The project team contacted the Ministry of Social Services to obtain information on the child welfare data collected by provincial agencies in Saskatchewan. We also approached six First Nations agencies that were sampled for the project, but none responded to the request for information.

Yukon

Structure of child welfare in the Yukon

The Department of Health and Social Services is responsible for child and youth services in the Yukon. The Minister of Health and Social Services Child oversees Family and Children's Services, which manages the delivery of child welfare services. The *Child and Family Services Act* provides the legislative framework and mandate for child protection services in the territory.

The Yukon Government is the child welfare service provider for all children and families living in the Territory. ISC funds the provision of child and family services to all First Nation children and families living in the Territory. For more information, please refer to Appendix D and E, which provide a summary of provincial/delegated agencies that are funded by ISC under the FNCFS program and the First Nations bands associated with them since fiscal year 2013-2014.

Child welfare data in the Yukon

Overview

Child welfare data in the territory is managed by the Department of Health and Social Services. The **Client Index System** (CIS) had been in place since 1999, but is unreliable, inconsistently used, and inaccurate.[18] A 2014 federal government audit recommended that the system be replaced. Since 2020, the territory has been using **Matrix**, which has been implemented as part of the Pan-Northern Project synchronizing child welfare data collection across the Yukon, Northwest Territories, and Nunavut.

Outreach

In the Yukon, we reached out to the Department of Health and Social Services to ask about the availability and quality of data that they hold as they relate to the CHRT compensation categories.

Availability of data and usability for identifying claimants

The full list of tables documenting the availability and quality of data in sampled child welfare authorities and agencies across Canada, as they relate to child welfare compensation categories is available in **Appendix P**. The usability of information **available from child welfare agencies and authorities** to help identify claimants eligible for compensation under the *2019 CHRT 39* child welfare compensation categories is summarized below:

Can the child be identified?

All sampled child welfare agencies in each jurisdiction collected the following demographic information on the children and youth in their care: Child Name, Date of Birth, and Indian Registration Number. Despite occasional typos noted with the *Child Name* and *Date of Birth*, the completeness of the data for these two data fields was generally high.

By contrast, the child's *Indian Registration Number* (IRN), is often missing or unknown to workers in child welfare agencies in Alberta, BC, NWT, Ontario, PEI, QC, and Yukon, even for children with status, and there were rarely any validation procedures in place to ensure that the information was accurate. There would be significant data quality issues to address if these data are used to help identify eligible children.

Is the child First Nations?

There is considerable variability in the quality of the information regarding the *First Nations identity* across the country. The provinces of NWT, Nova Scotia, Ontario, PEI, and Quebec all highlighted medium or high issues with missing or unknown data for this variable. It is important to note that in all delegated First Nations agencies sampled, the child needed to be from the First Nations band associated with the agency to receive services from the CFS agency. As such, even though these sampled agencies often did not have a specific data field dedicated to determining the First Nations identity of the child, it is reasonable to assume that the child placed by these agencies is First Nations.[19]

18 Office of the Auditor General of Canada. (2014). *2014 February Report of the Auditor General of Canada. Yukon Family and Children's Services—Department of Health and Social Services*. https://www.oag-bvg.gc.ca/internet/English/yuk_201402_e_39081.html

19 Given the fact that these delegated agencies were sampled, we cannot determine whether this is the case for all delegated agencies.

Issues with applicability to compensation categories: In Nova Scotia, although information on race is collected, this does not include information on whether a child is First Nations.

Does the child live on-reserve?

Ministries in Alberta, BC, Manitoba, Newfoundland and Labrador, Ontario, and Quebec were the only agencies that specifically collected information on the *child's residence on or off reserve*. Medium levels of missing or unknown information were noted in BC and small completeness issues were noted in Manitoba, Newfoundland and Labrador, and Quebec. Accuracy issues for residence on/off reserve were noted by key respondents in Alberta, Newfoundland and Labrador, Ontario, and Quebec.

In other sampled agencies, specifically, in New Brunswick, Northwest Territories, Nova Scotia, PEI, Saskatchewan, and a First Nations agency in Ontario, it is the *child's address of residence* that is documented. The address of residence can be used to establish residence on or off reserve. Some accuracy issues (including typos in addresses or addresses not being up-to-date) have been noted across jurisdictions.

Can the caregiver at the time of removal be identified?

The *caregiver's name* was collected in all sampled agencies. Completeness issues were identified in Alberta, BC, Newfoundland and Labrador, and Quebec.

Issues with applicability to compensation categories: Respondents from Alberta, BC, Manitoba, and New Brunswick all indicated that – although the *caregiver's name* is nearly always identified when a case is open – it is difficult to determine with certainty if this was the child's caregiver at the time of removal.

The *caregiver's Indian Registration Number* was available in agencies sampled in Alberta, BC, Manitoba, New Brunswick, Newfoundland and Labrador, Northwest Territories, Nova Scotia, Ontario, Saskatchewan, and the Yukon. However, issues with missing or unknown information were noted in Alberta, BC, Newfoundland and Labrador, NWT, Nova Scotia, Ontario, Quebec, and the Yukon. There were often no validation procedures in place to ensure that the information was accurate.

Is the caregiver First Nations?

All sampled agencies collected some information on the *caregiver's First Nations identity*, except for the First Nations agency sampled in Quebec. The amount of missing or unknown information for this variable is high in Alberta, BC, NWT, and very high in Nova Scotia, Ontario, PEI, and Quebec. Accuracy issues were noted in Quebec and the Yukon.

When was the child placed?

The quality of the information on the *start and end date of each placement* was high across all child welfare agencies sampled. All provinces collect this data, and the information was usually considered as accurate because it is tied to child maintenance costs that are reimbursed by the provincial or federal government. Some provinces noted that minor errors (i.e., differences of a few days) regarding the start/end date of placement could occur because of delays in inputting information.

Issues with applicability to compensation categories: Usually, this information is available for each placement and, if recorded consistently across different years, it could potentially serve as a proxy for length of time in care and moves in care. However, this would need to be confirmed with agencies because we did not ask about these constructs. Furthermore, if a child was placed by different child welfare agencies, this information would need to be linked across agencies.

Was the child placed outside of their community?

In order to determine if a child is placed outside of their community, the address of residence of the child (or caregiver) at the time of removal can be compared to the address of placement. Issues with missing or unknown data for *residence at the time of removal* were noted in Alberta, Manitoba, Newfoundland and Labrador, and Ontario. The address of residence can also be subject to small accuracy errors (including typos in addresses or addresses not being updated at the time of removal).

Issues with applicability to compensation categories: Key informants in Nova Scotia and PEI indicated that a child (or caregiver's) address is automatically updated once a family changes residence. This means that retrieving information on previous addresses would be difficult and would have to be done manually by looking at individual files.

Address of placement, on the other hand, seems to be more consistently collected, although some accuracy issues have been noted, especially for placements on reserve (e.g., in the Northwest Territories). Small issues with missing or unknown information regarding placement address were noted in Alberta, BC, NWT, and Quebec, with key informants in Ontario and New Brunswick noting more substantive issues with the completeness of this data field.

Was the child placed outside of their family?

In order to determine if a child was placed outside of their family, information on the *type of placement* the child experienced and whether it corresponds to a kinship care arrangement[20] is pertinent.

Placement type was documented across all jurisdictions. BC, Manitoba, Ontario, PEI, and Yukon all identified issues with the accuracy of responses provided by workers. For example, in PEI, formal kinship care is a type of foster care. Because of this, key informants in PEI stressed that there could be inter-worker differences, as some might indicate that a kinship placement is a foster placement.

Issues with applicability to compensation categories: Each sampled agency that provided us with information on the response options available for placement type had an equivalent of kinship care, except for Manitoba. In the agencies that provided a definition of kinship care (i.e., Alberta, BC, and Saskatchewan) the definition includes close friends or neighbours (i.e., kith) as possible kinship care arrangements. As such, this term could not be used as a direct estimate of placement outside of the family, if family is defined as not including extended community members.

Why was the child placed?

The *type of maltreatment investigated* was collected by nearly all sampled agencies. Generally, few data issues were identified. However, respondents in Alberta, Yukon, Nova Scotia, and Ontario highlighted issues with missing data.

Issues with applicability to compensation categories: The level of detail in the response options provided to workers varied considerably across provinces. Generally, they include different types of physical abuse, sexual abuse, emotional/psychological abuse, and neglect and are attached to the sections of the child protection Act of the respective province or territory that describe situations where a child may need protection. In some provinces – like Ontario - it is difficult to map investigation reasons directly unto these 5 categories because there are more than a hundred possible reasons for investigation, which are not always tied to maltreatment (e.g., caregiver mental health concerns). Definitions used to describe different types of abuse and neglect vary between jurisdictions (see Appendix A for more details). For example, inadequate nurturing or affection is recorded as emotional/psychological abuse *or* neglect, depending on the jurisdiction. Finally, investigated maltreatment at the time of an investigation does not always reflect the exact reason why a child was eventually placed in care.

In some cases, the maltreatment type includes information on who perpetrated the abuse (e.g., caregiver, uncle, etc.). If not, most provinces include information on the name of the *alleged perpetrator of maltreatment*. However, this information is sometimes difficult to retrieve because it is not documented by one field; to retrieve it, multiple sources of data would need to be searched, cross-referenced, and linked to accurately document this information.

The *substantiation* of the investigated maltreatment or risk of maltreatment is generally collected across different jurisdictions. However, some provinces do not measure substantiation directly. For example, in Ontario, a concern is verified – rather than substantiated. Similarly, in BC, substantiation, in of itself is not collected, rather a worker indicates whether a child is "in need of protection". Furthermore, the evidentiary threshold used to determine level of substantiation varies across provinces.

In some provinces/territories, following the investigation, the worker is asked about the *reason for placement*. In Alberta, information beyond substantiation of an initial investigation is not collected.

Issues with applicability to compensation categories: According to the CHRT order, the reason for placement can determine eligibility for compensation in two cases: 1) if the child was placed because of abuse perpetrated by their caregivers, or 2) if the child was placed in order to receive essential services.

1. In Manitoba, the response options for reason for placement do not include information on whether a child was placed because of abuse or neglect, which means that this field could not be used to determine eligibility.

20 Kinship care refers to placements with a child's extended family.

2 Nearly all respondents indicated that it would be very difficult to determine whether or not a child was placed in order to receive essential services because this was not formally considered as a reason for placement in their jurisdiction. Some indicated that if there was a review of case notes, the information might be included. However, there would be significant variance between workers regarding the amount of information they would include and if they describe the situation at all. In general, these children might be more likely to be found in voluntary, rather than court-ordered placements.

Other contextual information that may be of interest

In addition to the data fields presented in Table 2.1, we asked if information was collected regarding whether the child had access to prevention services. For provinces/territories that provided information for this question, most indicated that – although *access to prevention services* was a data field that was sometimes collected, the applicability to the order was limited. Child welfare information systems cannot provide any information on whether the child accessed prevention services before an initial investigation. As such, services could have been offered by other departments and this information would not be available.

In our conversations with respondents, we also asked if they systematically documented information related to structural and contextual challenges that may have influenced the decision to remove a child. Specifically, we asked whether the information system documents if the child's family experienced poverty, substance use, or inadequate housing as a potential reason for why the child was placed. Although some jurisdictions had information on *substance use and inadequate housing* - if this was deemed as being relevant to the child's file – collection of this information was not mandatory. Information on *poverty* was rarely documented. Furthermore, these factors could not be directly considered as a *reason for placement* in any of the provincial/territorial legislations guiding child welfare provision. As such, this information was not extractable as a data field in any of the jurisdictions. This information may be in case notes, with low reliability.

Summary: Data availability related to child welfare compensation eligibility

The findings of our review of data availability related to First Nations child welfare involvement show that there are significant gaps in the data available to document eligibility under the child welfare compensation categories. Across systems we reviewed, basic information regarding identity of the child and dates of placement are typically documented, as dates are tied to payments for placements. More detailed information regarding circumstances of placement, such as why a child was placed, if they were placed outside of their community, the primary caregiver at the time of placement, however, are less consistently available. The availability and quality of information is greatly impacted by the decentralized nature of child welfare service provision in Canada. Data collected by agencies with whom we spoke are less available in earlier years because many agencies used paper files before transitioning to a computerized information system.[21]

Our findings regarding information available through the FNCFS program and in sampled child welfare agencies and authorities should not be taken as representative of all First Nations child welfare data in Canada. No data was analyzed by the project team and the findings reflect a summary of the information contained in administrative systems based on key informant reports. Despite the limitations described here, the descriptive findings presented in this report provide an overview of the available child welfare data holdings and can inform the compensation process in several meaningful ways. Importantly, this report documents that relying on certain kinds of data could risk exclusion of many eligible claimants. While using administrative data can help facilitate and expedite proof of eligibility for compensation, documentation almost certainly does not exist for all eligible children, especially those who were involved in child welfare in earlier years.[22] Looking for alternatives in cases of missing or untraceable information will therefore be important.

21 Dates electronic systems (rather than paper records) were implemented vary across jurisdictions. In our review of data back to 2006, we found some systems were in place before that year, and others were implemented more recently (please see Appendix P for details).

Summary of child welfare data availability and quality for information of interest in the current AIP

Below, we include a summary of data fields that may be of interest for the settlement being negotiated at the time this report was submitted, January 31, 2022. These are summarized in Table 2.7. Information in this table was not included in our formal data collection process but may be helpful to inform the compensation process.

Table 2.7 Overview of data availability for information of interest in the current settlement process

Information of interest	General comment on availability
Length of time in care	**Operationalization:** Information on the length of time in care may be calculated for known placements for which there are *start and end dates*. When there are spells with multiple placements, the dates would need to be documented and accurate for all placements to reliably calculate length of time in care. If a child has experienced multiple periods of involvement with child welfare, the assumption should not be made that they have always been involved with the same child welfare agency, or within the same province or territory. As such, this would sometimes require linking information from different agencies together to complete the child's record of placement spells. **Findings:** The results of our findings suggest that *placement start date* and *end date* are generally available, both through the FNCFS program and child welfare agencies, with a high level of accuracy. As such, if the child was placed by the same agency, length of time in care should be calculable. If the child moved between agencies, this would require an additional calculation.
Moves in care	**Operationalization:** Moves in care may be found when systems reliably document the address of placement for each move to a new placement. Linking each *placement address* with the *dates of placement* could be one way of documenting moves. If this is not possible, linking *placement type* with the *dates of placement* could also provide an indication of moves in care, although this would likely underestimate the total number of moves in care because a child could be placed with different foster parents during their time in care. **Findings:** *Placement dates* and *placement address* are not available through the FNCFS program at ISC but are usually documented by child welfare agencies. However, the capacity to accurately link this information across time is not known.
Placement outside of the community	**Operationalization:** Placement within or outside of community can be documented by comparing *address of child* with *address of placement*, where this information is available. **Findings:** *Address of child* and *address of placement* are not available through the FNCFS program at ISC but are usually documented by child welfare agencies. However, issues have been noted with some agency's capacity to retrieve a child's address at the time of removal, which could impact the ability to identify children.
Type of maltreatment perpetrated by the caregiver	**Operationalization:** The type of maltreatment investigated, the substantiation level, and the reason for placement are all information that could be used to determine the type of maltreatment perpetrated by the caregiver. **Findings:** Information on the type of maltreatment perpetrated by the caregiver is not available through the FNCFS program at ISC. Child welfare agencies usually collect this information but definitions of different types of maltreatment and practices in place to substantiate claims vary considerably between jurisdictions. Furthermore, the maltreatment type investigated is not always reflective of the reason a child is eventually placed.

Jordan's Principle Compensation Categories: Data Availability

Overview of approach

As with child welfare compensation categories, the framework on the next page includes a list of data fields, that **if available and of high quality**, could assist in the process of assessing claim eligibility under the CHRT Jordan's Principle compensation categories (Table 2.8 on the following page). It is important to note that the proposed data fields which are matched to the compensation categories in the tables below were based on the project team's understanding of the compensation categories at the time the project took place (January to December 2021). Given that these compensation categories are currently under negotiation, the eligibility requirements (and related fields of interest) are expected to change.

Once we established the combination of data fields that was necessary to operationalize the compensation categories, we identified which **administrative data sources** (both at a national and jurisdictional level) collected this information during the relevant time periods. We then identified and contacted respondents who had knowledge about these data sources and asked them questions about the availability and quality of data fields, when possible.

As defined in the Jordan's Principle compensation category decision tree (Figure 2 in the Introduction), we understood **delays and denials** as capturing situations where a request for a service had been made and there was either a delay or a denial, and **service gaps** as either 1) a request had been made but there was a difference in the requested and accepted amount, or 2) no request had been made, but a child's identified needs were not met. Since the current AIP does not include gaps in services as an eligibility requirement for the Jordan's Principle class, this chapter focuses primarily on situations where a request *has* been made.

The sections that follow are related to the following categories of information:

1. **Data available at Indigenous Services Canada** (including individual-level and community-level data); and
2. **Other possible sources of administrative and survey data** related both to service receipt and contextual information that may influence the verification of compensation claims.

Table 2.8 Information of interest to help identify claimants under the CHRT Jordan's Principle compensation categories

Information of interest			CHRT Jordan's Principle compensation categories	
			First Nations children **living on or off reserve** who experienced a **denial, delay, or gap** in receiving essential services **between 2007 and 2017**	**First Nations** parents or grandparents **of children eligible for compensation**, unless they abused their child**
INFORMATION ON CHILD AND CAREGIVER	Can the child be identified?	Child Name (Family Name, Given Name)	X	
		Child Date of Birth	X	
		Child Indian Registration Number	X

		Decision details (rationale)	X	
	Did the child have needs that were unmet?	Need for essential services	X	

*** Identifying parents and caregivers is dependent on identifying the index child*

Data available at ISC

We began by investigating what information was collected centrally at Indigenous Services Canada by the **Jordan's Principle** team. Overall, there is a significant lack of data on Jordan's Principle requests prior to FY 2017-2018. Further, Jordan's Principle requests prior to FY 2017-2018 were typically redirected to existing ISC programs. We therefore included interviews with representatives from with **other ISC programs** that offer services usually covered under Jordan's Principle.

Once the programs of interest were identified, we held meetings with key respondents from each program to obtain information regarding the data held by each program. If representatives were unable to meet with us, we sent a template to obtain the information requested. Table 2.9 provides an overview of the category of products, services, and supports that are approved under Jordan's Principle and the names of other ISC programs that may have data on access to these services prior to 2017.

Although data from individual ISC programs is stored internally, it is important to note that ISC has recently implemented **Synergy in Action** (SIA), which is a directorate that functions to support the use of digital data within ISC programming. SIA does not collect raw data itself; rather, it accesses data from certain ISC programs (primarily within the First Nations and Inuit Health Branch) to provide analytics regarding the data collected within these programs. Its main goal is to use "innovative approaches to make data available for decision-making."[22] Because SIA stores data from different ISC programs, it could eventually be an avenue to explore for the identification of prospective claimants.

Table 2.9 Services approved under Jordan's Principle and names of ISC programs that offer these services

Jordan's Principle service category name	Examples of products, services and supports approved Jordan's Principle	Other ISC programs that might have information on these services
Allied Health	• Assessments and screenings for allied health services • Services provided by allied health practitioners, includes occupational and speech therapy	• Home & Community Care (*FNIHB*[23])
Oral Health (excluding orthodontics)	• Diagnostic services, includes examinations and x-rays • Oral surgery services • Restorative services, includes caries and crowns • Endodontic services, includes root canals	• NIHB – Dental (*FNIHB*) • Children's Oral Health Initiative (*FNIHB*)
Education	• Assistive technologies and electronics • Psycho-educational assessments • Tutoring services • Education assistants	• High-Cost Special Education Program (*Education*) • Elementary and Secondary Education Program (*Education*)
Vision Care	• Examinations • Corrective eyewear (eyeglasses and contact lenses)	• NIHB – Vision (*FNIHB*)

(continued on following page)

22 Email communication with SIA staff.

23 The First Nations and Inuit Health Branch (FNIHB) at ISC aims to "provide effective, sustainable, and culturally appropriate health programs and services that contribute to the reduction of gaps in health status between First Nations and Inuit and other Canadians" (p. 4). The programs available through this department of ISC have shifted across the years. They currently include primary care services (e.g., Jordan's Principle, Home and Community Care), health promotion and disease prevention (e.g., the Children's Oral Health Initiative) and supplementary health benefits (i.e., the Non-Insured Health Benefits [NIHB]) (First Nations and Inuit Health Branch, 2011).

Table 2.9 Services approved under Jordan's Principle and names of ISC programs that offer these services *(continued)*

Jordan's Principle service category name	Examples of products, services and supports approved Jordan's Principle	Other ISC programs that might have information on these services
Healthy Child Development	• Car seats • Clothing, shoes, and accessories • Diapers and toilet training materials • Household items • Early Intervention Coordinators • Training (e.g., Child Development)	• Income Assistance and Assisted Living programs (*Social Policy & Programs*) • The Family Violence Prevention Program (*Social Policy & Programs*) • Urban Programming for Indigenous Peoples (*Social Policy & Programs*)
Infrastructure	• Adaptive furniture and minor modifications/renovations • Enhanced home security and safety equipment/systems • Accessible vehicles • Playground equipment	• NIHB – Medical Supplies and Equipment (*FNIHB*)
Medical Equipment and Supplies	• Environmental aids, includes lifting and transfer aids and bars • Mobility aids, including standing and positioning aids and wheelchairs • Sensory / therapeutic items	• NIHB – Medical Supplies and Equipment (*FNIHB*)
Medical Transportation	• Travel (air, ground and water) / Meals and accommodations • Emergency Transportation • Additional escorts	• NIHB – Medical Transport (*FNIHB*) • Mental Wellness (*FNIHB*)
Mental Wellness	• Assessments • Individual therapy • Treatment for mental health and substance use, including residential • Group programming • Choose Life Community Funding • Land-based activities	• NIHB – Mental Health (*FNIHB*) • Mental Wellness (*FNIHB*)
Orthodontic	• Orthodontic consultations / treatments	• NIHB – Dental (*FNIHB*) • Children's Oral Health Initiative (*FNIHB*)
Medications/ Nutritional Supplements	• Prescription / Over-the-counter medications • Infant formula / Nutritional supplements / Vitamins	• NIHB – Drugs (*FNIHB*)
Respite	• Respite care (individual or group) • Daycare / child care / day program / camp	• Home & Community Care (*FNIHB*) • Income Assistance and Assisted Living programs (*Social Policy & Programs*) • The Family Violence Prevention Program (*Social Policy & Programs*) • Urban Programming for Indigenous Peoples (*Social Policy & Programs*)
Social	• Recreational / cultural activities	• Mental Wellness (*FNIHB*) • Home & Community Care (*FNIHB*)
Travel	• Travel (air, ground and water)* / Meals and accommodations ** Non-medical travel to support best interest of child. For example, to maintain family unit if caregiver hospitalized*	None identified

Jordan's Principle (FNIHB)

The long road leading to the implementation of Jordan's Principle by ISC is illustrated below:

On **December 12, 2007**, the House of Commons voted with unanimous support to adopt Jordan's Principle. In 2007, the federal government approved a fund of $11 million over 4 years for the implementation of Jordan's Principle. The implementation focused on "jurisdictional disputes involving First Nation children living on reserve with multiple disabilities requiring services from multiple service providers."[24]

By **2016**, because the definition of Jordan's Principle used by the federal government was so narrow, no Jordan's Principle cases were identified and all requests were siloed through existing federal programs.[25]

In **January 2016**, the CHRT found that Canada had failed to implement the full meaning of Jordan's Principle, which resulted in service gaps, delays, and denials for First Nations children.

On **July 6, 2016**, Canada committed to provide $382 million in funding and to "broaden the scope of Jordan's Principle, and deliver service coordination services for First Nations families" (p. 7).[26] Between 2016 and 2018, Health Canada and INAC shared the responsibility for processing requests for health, and social/education services respectively.[27]

In **May 2017** (2017 CHRT 14) and **November 2017** (2017 CHRT 35), the CHRT ruled that the definition of Jordan's Principle be expanded to include First Nations children living on and off reserve. The rulings also ensured that the government department of first contact would incur the costs of the service requested, with case conferencing happening after the service had been provided.

This led to changes in Jordan's Principle **eligibility** over time, which were highlighted in the *Final Compensation Framework*, as follows:

"Between December 12, 2007, and July 4, 2016

- A child registered as an Indian per the Indian Act or eligible to be registered and resident on reserve;
- Child with multiple disabilities requiring multiple service providers;
- Limited to health and social services;
- A jurisdictional dispute existed involving different levels of government (disputes between federal government departments and agencies were excluded);
- The case must be confirmed to be a Jordan's Principle case by both the federal and provincial Deputy Ministers); and
- The service had to be consistent with normative standards" (*Final Compensation Framework*, p. 6)

"Between July 5, 2016, and November 2, 2017

- A child registered as an Indian per the Indian Act or eligible to be registered and resident on reserve (July 5, 2016 to September 14, 2016);
- The child had a disability or critical short- term illness (July 5, 2016 to May 26, 2017);
- The service was limited to health and social services (July 5, 2016 to May 26, 2017)." (*Final Compensation Framework*, pp. 6-7)

Given the shifts in Jordan's Principle eligibility and implementation, any data on Jordan's Principle requests that may be available at ISC prior to November 2, 2017, must be understood with these caveats in mind. Notably, data on requests prior to November 2017 does not include children living off reserve, it was limited to children with disabilities, and it did not include children who were recognized members of a First Nations community, but who were not eligible to be registered.

Availability of data from Fiscal Year 2017-2018

Starting in July 2017, a standardized Excel spreadsheet was developed and implemented to track Jordan's Principle requests. These data were consolidated into a national database for reporting of monthly statistics. With certain exceptions, the data are reported and structured in a manner that enables some data analyses. Due to significant variation across regions, a team from ISC headquarters undertook a retroactive, manual categorization exercise in 2019, to ensure a level of consistency in category reporting across regions and over time.[28]

The data dictionary for individual and group Jordan's Principle requests in FY 2017-2018 is available in Appendix Q. Appendix R provides information on the completeness and validity of these variables in FY 2017-2018. Using these documents, the project team has summarized the availability and gaps in data held at ISC regarding Jordan's Principle requests in FY 2017-2018 as they relate to the CHRT Jordan's Principle compensation categories in a table, which can be found in **Appendix S**.

For FY 2017-2018, there is significantly more information available on individual Jordan's Principle requests, compared to group Jordan's Principle requests. A summary of the information available **in FY 2017-2018** and its usability to identify children eligible for compensation under Jordan's Principle compensation categories is included below:

Can the child be identified?

For individual requests, the *Child Unique Identifier* and *Date of Birth* is available with a high level of completeness. The Child's Unique Identifier needs to be linked to a Child Name for it to be usable. No information is collected on the *Child's Indian Registration Number*.

For group requests, there is no information on the name of children who are part of the group request.

Can the caregiver be identified?

No information is available on the caregiver identity for individual and group requests.

Was the request approved or denied?

For individual and group requests, the *decision taken (Approved/ Denied/ Escalated/Referred)* is available with a high level of completeness. Information on whether the *product/service was actually delivered* is only completed 10% of the time for individual requests and the data field is not available for group requests.

Should the service be covered under Jordan's Principle as defined in *2017 CHRT 14* and *35*?

The *product/service/support requested* and *decision details (rationale)* are available for both individual and group requests. However, decision details are missing 40% of the time for individual requests and 50% of the time for group requests. *Reason for application/needs* is collected for individual requests, but not group requests.

Did the child obtain the service after an unreasonable delay?

The following information is available for individual and group requests: *date request received*, *date of decision*, and *date of response*. The *date the service/ product was delivered* is only complete 10% of the time for individual requests and it is not available as a data field for group requests.

Was there a difference between the approved and requested amount?

The *approved* and *requested amount* is available for both individual and group requests.

Availability of data between December 2007 and March 2017

The narrow and inadequate implementation of Jordan's Principle by the Government of Canada prior to FY 2017-2018 is accompanied by minimal data and poor data quality regarding Jordan's Principle requests in those years. Table 2.10 provides an overview of the availability of data on Jordan's Principle requests prior to FY 2017-2018.

28 Information provided by Jordan's Principle staff.

Table 2.10 Availability of Jordan's Principle data prior to FY 2017-2018

Time period	Information on availability of Jordan's Principle data
Pre-January 2016	**Location/format of data:** Information located primarily from materials within the First Nations and Inuit Health Branch at Health Canada. Files were kept in different formats (e.g., paper, spreadsheet, etc.) with the information saved in personal file folders or email directories. **Information collected:** Available materials reviewed indicate that information was unstructured narrative text with no consistent procedure for describing the child's circumstances at the time of application (i.e., child's age, sex, location, condition/diagnosis, type of service). **Quality of data:** Data prior to January 2016 is scant, fragmented, and vague.
January–July 2016	The need for collecting structured data was identified and work was initiated to determine whether a new system would be developed, or an existing system could be viably modified to meet the need. During this time, information continued to be kept in personal files at the regional level. Data on products/services provided were manually collated from monthly email submissions.
August 2016–March 2017	**Location/format of data:** A number of regions independently produced Excel spreadsheets to help track information. Since the regional spreadsheets recorded the data in slightly different ways, national reporting of products/services was undertaken through manual consolidations of the regional spreadsheets. After December 2016, regions started using the *case management form*. **Information collected:** These spreadsheets provided data on the number of children and products and/or services requested, initially based on unstructured information held in regional files. In addition to obtaining data from individuals who request products/services directly from the federal government, Jordan's Principle funding was made available to communities and organizations through *Contribution Agreements*. The agreement holders were instructed to report a minimum set of data elements to the federal government as part of the Contribution Agreements (i.e. the service/support, number of children, and total cost). This information was submitted in a text based document by the recipient up to 120 days following the end of the agreement. **Quality of data:** Review of these data show that the quality and consistency of reporting varies significantly across agreement holders. Information is frequently difficult to interpret and challenging to extract and structure for data analytic processes because there is no mechanism to extract information from completed case management forms to an electronic database that can be structured for data analysis.

Source: *Information directly provided by Jordan's Principle staff at ISC*

In order to better understand the historical data available on Jordan's Principle for individual and group requests (prior to 2017), the project team prepared a template, which was distributed to all ISC regions, branches, and sectors.

Only four Jordan's Principle ISC regions (Alberta, Atlantic, Northern, and Quebec) and two Regional Operations regions (Ontario and Manitoba) indicated that they had information on individual Jordan's Principle requests prior to the implementation of a tracking system in 2017. Table 2.11 on the following page provides information on the type of information available. This table reflects the content of the interviews conducted with *current* ISC staff. High levels of staff turnover could mean that there is an underestimation of the types of data available.

Table 2.11 indicates that the format and type of information collected by different regions and departments for individual requests prior to 2017 vary. Some FNCFS ISC regions such as Alberta may have more complete information available. In contrast, only a few regions indicated they had usable information concerning Jordan's Principle group requests prior to October 2017: Manitoba (through the Jordan's Principle and Regional Operations departments) and Quebec (Jordan's Principle department).

Table 2.11 Data on individual Jordan's Principle requests available prior to July 2017 based on information provided by respondents

	Jordan's Principle				Regional Operations Branch	
Region	**Alberta**	**Quebec**	**Northern Region**	**Atlantic**	**Ontario**	**Manitoba**
In what format is it currently stored?	SIA Sharepoint	Excel	Excel	Excel	Electronic	Administrative data system (saved in CIDM under protected status)
Name of child	Yes	Yes	No	No	No	Yes
First Nations status of child (e.g., yes/no/pending)	Yes	Yes	No	No	Yes	Yes
Child's date of birth	Yes	Yes	No	No	No	Yes
Reason for request	Yes	Yes	No	Yes	Yes	Yes
Date of request	Yes	Yes	Yes	Yes	No	Yes
Urgency of initial assessment (e.g., urgent/not urgent)	Yes	Yes	No	No	No	No
Product/support/service requested	Yes	Yes	Yes	Yes	Yes	Yes
Funding requested	Yes	Yes	Yes	No	Yes	No
Decision following request (Approved/Denied/Referred)	Yes	Yes	Yes	Yes	No	Yes
Date of decision (approval, denial, referred)	Yes	Yes	No	Yes	No	Yes
Reason for decision (approval, denial, referred)	Yes	Yes	Yes	Yes	No	Yes
Funding approved	Yes	Yes	Yes	No	Yes	No
Product/support/service provided	Yes	Yes	Yes	No	No	Yes
Date of product/support/ service provision	Yes	Yes	Yes	No	No	Yes
Are you aware of any missing records? Please elaborate.	Unknown	No	No	No	No	No
Any major data accuracy issues within the information that does exist? Please elaborate.	Yes: data input was not yet consistent.	No issues noted	Yes: NIHB records and 'formal' requests only	No issues noted	No issues noted	No issues noted

NIHB (FNIHB)

Jordan's Principle claims prior to FY 2017-2018 were often redirected to NIHB. As such, the NIHB program at ISC may provide important information on whether First Nations children experienced a denial, delay, or gap in receiving essential health services covered under Jordan's Principle according to *2017 CHRT 14* and *2017 CHRT 35*.

The NIHB is a "national program that provides eligible First Nations and Inuit clients with coverage for a range of medically necessary health benefits when these benefits are not otherwise covered through private or provincial or territorial health insurance plans or social programs. NIHB program benefits include prescription drugs and over-the-counter medications, dental and vision care, medical supplies and equipment, mental health counselling, and transportation to access medically required health services that are not available on the reserve or in the community of residence."[29]

In order to be eligible for the NIHB program, an individual must be:

- a First Nations person who is registered under the *Indian Act* (commonly referred to as a "status Indian")
- an Inuk recognized by an Inuit land claim organization
- a child less than 18 months old whose parent is a registered First Nations person or a recognized Inuk[30]

The NIHB program provides services to *some* of the individuals eligible for compensation under the *2019 CHRT 39* compensation categories. It does not cover services to unregistered (or non-status) First Nations children, unless the child is eighteen months or younger and has a parent who is registered. It also does not provide benefits to individuals who are already have these benefits covered through a private or provincial or territorial health insurance plan or social programs.[31]

Overview of data available between 2007 and 2017

The NIHB team has indicated that there are two types of data collected by the program:

1. **Reference data** (e.g., population data, pricing lists, etc.) and
2. **Transactional data** (requests adjudicated by a claims processing system according to automated or pre-established business rules for the different services offered by the NIHB program).

a. Reference data: Population information

Population data is drawn from the Status Verification System. Population data on First Nations clients are based on information provided by Crown-Indigenous Relations and Northern Affairs Canada (CIRNA).[32]

The data dictionary for the Status Verification System is available in Appendix T. The data dictionary indicates that NIHB holds identifying information on the children and adults that make claims for NIHB benefits. This includes information on the first name and last name of the client, Indian Registration Number and Band.

b. Transactional Data

Transactional data are collected for all NIHB benefit categories. The information provided in Table 2.12 on the following page refers to the benefits currently offered. Changes in benefits offered by the NIHB over time from 2007 to 2017 can be found in annual reports from the program. The administrative process for a claim is described in Appendix U.

29 Indigenous Services Canada. (n.d.). *Non-Insured Health Benefits (NIHB) Medical Transportation Policy Framework (Interim)*. https://www.sac-isc.gc.ca/eng/1579891130443/1579891286837
30 Indigenous Services Canada. (n.d.). *Who is eligible for the Non-Insured Health Benefits program?* https://www.sac-isc.gc.ca/eng/1574187596083/1576511384063
31 Eligibility for NIHB coverage in British Columbia differs from that of other provinces and territories for recent years as administration of NIHB programs is now done at the provincial level. As of FY 2013-2014, the First Nations Health Authority (FNHA) was created in British Columbia. In July-October 2013, FNIHB programs, services, and responsibilities were shifted to the FNHA for First Nations individuals living in BC. As of this transition, most of the FNIHB clients in BC are Inuit or First Nations associated with a band in BC but living in another province who therefore do not fall under the provincial FNHA scope of clientele.
32 Email exchange with NIHB staff.

Table 2.12 Overview of availability of data from the NIHB program based on information provided by respondents

	NIHB Benefit Category			
	Dental, Pharmacy and Medical Supplies and Equipment (MS&E)	**Medical Transportation (MT)**	**Vision Care**	**Mental Health Care**
Types of benefits provided	MS & E benefits include: Equipment and Supplies for Audiology, Limb and body orthotics, Footwear, Oxygen, Pressure devices, Prosthetics, Respiratory care, Self-care, Low vision, Mobility, Communication, Medical care Pharmacy benefits include: Medications (prescription, non-prescription/over-the-counter, unspecified medication), Nutritional supplements Dental benefits include: Diagnostic services (examinations, radiographs, laboratory tests), Preventative services, Restorative services, Endodontic services, Periodontal and Prosthodontic services, Oral surgery services, Orthodontic services	MT benefits include: Emergency medical transportation, Non-emergency medical transportation, Meals, Accommodations, Escort travel, Medical provider travel	Vision Care benefits include: Vision care consultation/ examination, Corrective eyewear (glasses, contact lenses, other), Eye care treatments/therapy	Mental Health Care benefits include: Mental Health counselling
Administrative data systems used between 2007 and 2017	Claims for dental, pharmacy, and MS&E are stored within the Health Information and Claims Processing Services (HICPS) system. The HICPS system has been governed by three separate contracts: HICPS I (prior to 2009), HICPS II (between 2009 and 2020), and HICPS III (from 2020 onwards). No major differences are noted between the contracts related to data collected.	Data are collected through various electronic systems. Most data is collected through the Medical Transportation Record System (MTRS). No data for travel covered prior to 2009 is available in the MTRS. Historically, some regions tracked MT claims though their own administrative systems (see Appendix X for further details): • MB until 2014 via FoxPro • AB until 2019 via Medical Transportation Reporting Database (MTDR) and FoxPro • ON until December 2016 via the Ontario Medical Transportation System (OMTS) • NWT and Nunavut still have their own systems that are used to manage the MT Benefit	Prior to June 2020, data related to Vision Care was managed regionally through a system created by Omnisoft. After June 2020, this data is available through the HICPS III system.	Prior to 2017, regions managed the benefit in various ways: • ON and AB regions used a system called the Mental Health Management System (MHMS). • ATL region used the short term crisis intervention mental health counselling (STCIHMC) • MB used Microsoft Access Database • SK used Mental Health Database • Northern region used Lotus 123 Between 2017 and 2020, Mental Health claims were captured in a single system, built by the Indian Residential School Resolution Health Support Program. As of June 2020, Mental Health Care was incorporated into HICPS in the newest version of the system.

(continued on following page)

Table 2.12 Overview of availability of data from the NIHB program based on information provided by respondents *(continued)*

	NIHB Benefit Category			
	Dental, Pharmacy and Medical Supplies and Equipment (MS&E)	**Medical Transportation (MT)**	**Vision Care**	**Mental Health Care**
Data fields collected	The data dictionaries for these benefits are available in Appendix V and the error codes are available in Appendix W. The variables include information on the client (Name, ID, IRS), as well as when a case was opened, when it was filed, when it was reviewed, and when it was settled. The data also describes the benefit type (e.g., Dental, Pharmacy, etc.) and benefit sub-type and case type (e.g., approval, rejection, appeal). The results of annual integrity audits conducted by an independent auditor on the HICPS system have shown an error rate of less than 3 percent for the past years.	The data reporting template for the Medical Transportation data is available in Appendix Y. The document shows that MTRS primarily reports on Travel Authorizations, Vouchers, Invoices, Appointment and Patients, as well as the measures used to quantify it and the attributes that can be used to sort, summarize, or filter information. Many MT benefit management systems are used almost exclusively for tracking approved travel, with no information available for requests that may have been made to a regional office and denied. Other limitations of this data can be found in Appendix Y.	No data dictionaries exist for the legacy systems used by region. The NIHB team has shared the original system architecture for each region. An example of the architecture from Alberta region is available in Appendix Z. The original system architecture for the vision care data systems include information on the client, benefit type, the reason a benefit was discontinued or approved, the date an action was taken, as well as the difference between the requested and paid amount.	Documentation, including data dictionaries, was not created for most of the ad hoc systems built and utilized by the regional offices and most of these legacy systems have since been decommissioned. Data tables exist for the MHMS system used by ONT and AB prior to 2017 and are available in Appendix AA. The variables include information on the client (Name, DOB, address, etc.), the request date, the approval code, the mental health reason, the date an action was taken, the therapist type and therapist name.

Limitations of NIHB data

The main limitations of NIHB data[33] are detailed below:

- A significant proportion of NIHB benefits are delivered in community under **contribution agreements** or other **transfer arrangements**. Data on services delivered in this manner, which represent approximately 20% of NIHB expenditure, are not collected or maintained by NIHB.
- Some NIHB benefits are provided through **contracts with service providers** (e.g., dentists, mental health councillors, etc.). Service level data are not maintained for most for these arrangements.
- Data is **limited to claims paid by NIHB** only and cannot be used as an absolute value for benefit or treatment access or uptake. Utilization is underrepresented as claim expenditures are covered by P/T plans, provincially funded programs, public or private insurance or cash transactions and data for services provided in Nursing Homes and under contribution or transfer agreements not included.
- NIHB data **does not contain information on residency** (such as client addresses). Individuals are associated with the band to which they are registered or the land claim organization under which they are recognized, rather than where they ordinarily reside.
- Requests go through several stages of adjudication and can be stopped (or "denied") for various reasons, including incorrect or missing information.[34]

33 The information provided comes mostly from the presentation we received from the NIHB team, which is available in Appendix U.

34 The NIHB program makes use of the term "rejection" when a claim submitted is not linked to a payment as a result of system adjudication logic. The term "denial" is used when a request for a prior approval is denied, following a review of the client and physician submitted information. In this case, there is a single denial code entered in the system to indicate the reviewer's decision. The reasons for the denial are stored separately and cannot be queried though our reporting system (i.e., they need to be looked up one at a time in the claims adjudication system).

Other ISC Programs

As highlighted in Table 2.9 on p. 74, we identified other ISC programs that provide certain types of services that can be requested under Jordan's Principle. These include Home and Community Care, the Children's Oral Health Initiative, Mental Wellness, and relevant programs from the Education department and the Social services, policies, and planning department. Responses to our outreach to these programs are included in the tables below. Our results show that no information existed on the dates of a request for services, the date of a decision, the reason for a decision, or the difference between approved and requested amounts. Only information about the type of service provided and on what date that service was provided was available. This greatly limits the capacity to use any information provided from these programs to identify children eligible for compensation under Jordan's Principle compensation categories.

Home and Community Care (FNIHB)

Table 2.13 Overview of the Home and Community Care program at ISC and the availability and gaps in data it collects

Home and Community Care Program			
Purpose of program	The program provides a continuum of basic home and community care services that enable First Nations and Inuit of all ages, including vulnerable seniors and those living with disabilities, acute or chronic illness, to receive the care they need in their homes and communities.		
Services offered	Client services are delivered based on a needs assessment and follow a case management process. In general, services are delivered by health care professionals (nurses, personal care workers, etc…) are employed by the band or community. The program offers allied services that can include nursing, personal care such as help with bathing, dressing, and feeding, physiotherapy, occupational therapy, speech therapy, social work, dietitian services, homemaking, and respite services.		
Program eligibility requirements	First Nations and Inuit children of all ages are eligible for this program.		
Overview of datasets used between 2007 and 2017	Dataset name	Years in use	Format in which it is currently stored
	e-SDRT	2007 to present	Electronic
	Dataset name	Years in use	Format in which it is currently stored
	e-HRTT	2009	Electronic
Data fields available in dataset	Variables for which data is collected using e-SDRT and e-HRTT are different. **e-SDRT:** community or tribal council name; staff name; year and month; client identifier; birth date; gender; admission; primary reason for home care service; referral date; admission date; discharge date; client type; reason for discharge; home care services; services not provided; community space; date of service provided; category of service; hours of service provided; numbers of home visit; Services not provided with number of attempted home visits reasons for it and hours; **e-HRTT:** community or tribal council name; staff name; date of last update; employee name; start date; end date; leave type; position/role; licence/certification; full time equivalent (Full time/Part Time/Casual), education: highest formal level; source of fund		
Applicability to Jordan's Principle compensation categories	No information on dates of request, date of decision, reason for decision, or difference between approved and requested amounts. Only information about the client, the type of service provided and on what date that service was provided, as well as if a service was not provided.		
Data limitations	Some inconsistencies in reporting can be observed due to the large number of communities with different level and type of needs as well as reporting challenges.		

Children's Oral Health Initiative (FNIHB)

Table 2.14 Overview of the Children's Oral Health Initiative (COHI) program at ISC and the availability and gaps in data it collects

Children's Oral Health Initiative (COHI) (an initiative of the Community Oral Health Services)			
Purpose of program	The Children's Oral Health Initiative (COHI) was developed to address the disparity between the oral health of First Nations and Inuit and that of the general Canadian population. COHI was launched on a test basis in Fall 2004. COHI focuses on the prevention of dental disease and promotion of good oral health practices. The goal of COHI is to shift the emphasis from a primarily treatment-based approach to a more balanced prevention and treatment focus. Health Canada expects that the COHI, once fully implemented in subsequent years, will result in significant improvement of the oral health in First Nations and Inuit.		
Services offered	COHI is delivered in communities by a COHI provider (a dental professional) and a COHI aide. The COHI aide is a community member who acts as an essential link between the oral health professional and the community. They act as oral knowledge-keepers in the community and work collaboratively with the COHI provider to implement COHI services when the COHI provider is in a community. COHI services provided in communities include an annual dental screening by a COHI provider, fluoride varnish applications, sealants and temporary fillings and one-on-one or group oral-health education sessions.		
Program eligibility requirements	The program is available for children aged 0-7 years old, as well as pregnant women and primary caregivers, who are a member of a First Nations community. Oral health services are available to clients who present themselves at a COHS clinic/site. **COHS does not deny any services**. Services are unavailable only where COHS clinics do not exist. Clinics may not exist in the communities that are close to urban areas that provide dental services, and areas that have extremely low population.		
Overview of datasets used between 2007 and 2017	Dataset name	Years in use	Format in which it is currently stored
	Oral health services daily record (OHSDR): documents transactions data (screenings, procedures, etc)	2007-2020	Electronic
	Dataset name	Years in use	Format in which it is currently stored
	Oral screening record (OSR): documents outcomes, based on screenings only, allows them to see regions, communities, ages that have different outcomes (e.g, dental decay)	2007-2020	Electronic
Main data fields available in dataset	See below for list of main variables in each database. The OHSDR captures more information about a range of dental services, while the OSR is specifically looking at screening variables. List from national-level COHS staff: **OSR** variables: region, community name, community code (numeric), client number, client name (Last, First), gender, birthdate (YYYY-MM-DD), age at screening (1), age group (0-4 or 5-7), screening date (YYYY-MM-DD), Screening provider (Last, First), no teeth present, decal present, decayed, filled, missing tooth, number of sealant planned **OHSDR** variables: region, community name, community code (numeric), client number, client name (Last, First), gender, birthdate (YYYY-MM-DD), age (1), age group (0-4, 5-7), provider number (numeric), provider first name, provider last name, procedure code (numeric), procedure description (e.g., screening), number of people (unclear) * There is no data dictionary available for these data sources. There is one database holding all of these datasets: the **National Dental Database**. The National Dental Database feeds its data into Synergy In Action (SIA) which is a data warehousing platform from which other tools or methods of data extraction can be done (e.g., dashboards).		

(continued on following page)

Table 2.14 Overview of the Children's Oral Health Initiative (COHI) program at ISC and the availability and gaps in data it collects *(continued)*

	Children's Oral Health Initiative (COHI) (an initiative of the Community Oral Health Services)
Do fields contain information on gaps, denials, or delays of services?	No information on dates of request, date of decision, reason for decision, or difference between approved and requested amounts. Only information about the client, the type of service provided and on what date that service was provided, as well as the severity of dental issues for children who were examined.
Data limitations	The data doesn't currently allow for easy linkage of the individual client identifiers with outcomes data. There is an analysis underway aiming to link the transactional and outcomes data in an effort to understand unmet needs. This analysis includes examination of service utilization and accessibility. At the community level, the current analysis is examining which First Nations communities have access to COHS clinics. By process of elimination, a full list of communities could be used to cross-reference and determine the communities that do not have access. Staff has identified data entry issues. Staff notes that the data held at the national level doesn't reflect the data held at the regional level. The national COHS team is undertaking to identify data quality issues related to front end data input and back-end data extraction. It is unclear whether migration of data has happened as the database has changed multiple times. A report will be issued in 2022 showing the results of the national-level analysis.

Mental Wellness (FNIHB)

There are a number of different Mental Wellness programs at ISC, including Mental Health and Suicide Prevention, Mental Health – Victims of Family Violence Investments, Mental Wellness Teams (MWT) Program, Mental Health Crisis Intervention Teams (MHCIT), Substance Abuse Prevention and Treatment – National Native Alcohol and Drug Abuse Program (NNADAP) and National Youth Solvent Abuse Program (NYSAP) Treatment Centres, and the Indian Residential School (IRS) Resolution Health Support Program (RHSP).

Following our request for information on data collected by Mental Wellness programs, we received a response from the Indian Residential School (IRS) Resolution Health Support Program, summarized in Table 2.15 on the following page.

Table 2.15 Overview of the Indian Residential Schools Resolution Health Support program and the availability of data

Indian Residential Schools Resolution Health Support Program (IRS RSHP)			
Purpose of program	The Indian Residential Schools Resolution Health Support Program (IRS RHSP) was initially established as part of the 2006 Indian Residential Schools Settlement Agreement, and provides support services to former students of Indian Residential Schools and their families. Services are now expanded to students of Federal Indian Day Schools and their families, as well as those affected by the issue of Missing and Murdered Indigenous Women and Girls. These services include access to cultural and emotional support services; professional counselling services (individual and family); and assistance with the cost of transportation services (to access counselling services and/or Elders).		
Services offered	The Indian Residential Schools Resolution Health Support Program (IRS RHSP) provides the following services: **Cultural and Emotional Supports** • Cultural and emotional support workers are hired by community organizations to provide services. Cultural support services are provided by Elders or traditional healers and emotional support services are provided by trained and trauma-informed Indigenous health workers • The services of an RHSW or CSP can be accessed by walking into an organization that provides services, by calling an ISC regional office, or by being referred by the Hope for Wellness Helpline, a mental health counsellor, or a community-based service provider **Mental Health Counselling** • Mental health counselling services are provided by regulated service providers such as psychologists and social workers, registered in their province or territory, and enrolled with Indigenous Services Canada Funding for professional mental health counselling services is primarily provided on a 'fee for service' basis (service providers invoice Indigenous Services Canada) • In cases where professional mental health counselling is not available locally, ISC provides support for medical transportation, based on Non Insured Benefits Program (NIHB) policies and guidelines • Clients who wish to access professional mental health counselling contact their ISC regional office, who then help to coordinate appointments and travel • Clients do not have to be NIHB eligible (i.e. status First Nation or registered Inuit) in order to access professional mental health counselling through the IRS RHSP • Clients may choose to access the services of both professional mental health counsellors and cultural and emotional support providers		
Program eligibility requirements	Services are available to eligible individuals regardless of Indigenous status, place of residence and age. Eligibility is determined by self-identification tied to the connection of IRS, IDS or MMIWG.		
Overview of datasets used between 2007 and 2017	Dataset name	Years in use	Format in which it is currently stored
	Mental Health Services Tracking System (MHSTS)- used to capture Mental Health Counselling statistics only.	2009-Present	Electronic
Main data fields available in dataset	An "Unknown" category is available for Gender, Age and Indigenous identity Field used: Name, Date of Birth, Gender, Type of Client (i.e. former student, family member, IAP, CEP, MMIWG, IDS student) – added in 2020, Address, Status Number, Mental Health Service Provider Name, Mental Health Service provider Addresses, Mental Health Service Provider Professional Rates, Mental Health Service provider Vendor Number, Type of service (individual, family, telehealth), Date service provided		
Applicability to Jordan's Principle categories	No information on dates of request, date of decision, reason for decision, or difference between approved and requested amounts. Only information about the client, the type of service provided and on what date that service was provided.		
Data limitations	Indigenous identity is not a mandatory field. As such, many clients are marked as unknown. In turn, receiving a full picture of First Nation clients would be difficult. To note: Data input is completed at a regional level. The regions determine eligibility prior to entering into MHSTS; Everyone that is in the system is eligible for services.		

Table 2.16 Overview of the Education programs at ISC and the availability and gaps in data they collect

	High-Cost Special Education Program (HCSEP)			Elementary & Secondary Education Program		
Purpose of program	The High-Cost Special Education Program funds additional services for high-cost special education students assessed with moderate to profound learning disabilities. Funding is provided for direct service support in the form of personnel, adaptive materials and resource services.			The Elementary and Secondary Education Program funds special education services for First Nations students identified as having mild to profound learning disabilities. Funding is provided for programming, remedial instruction, clinical services and resource teacher staffing.		
Services offered[35]	The High-Cost Special Education Program consists of direct and indirect services. Direct services include a number of classroom and school-based services related to the education and support of students with high-cost special education needs, such as acquisition of professional assessments, completion of student assessments, educational psychological, speech and language services, counselling and social services, Elder, mentoring and cultural services, assistive technologies and equipment purchases. Direct services also include salaries and benefits for special education teachers and individual teacher aides and para-professional workers. Indirect services represent funding to eligible First Nations recipients for the development of special education programs and services on the understanding that each First Nations student with special education needs is unique.			Eligible expenditures directly related to student support services and may include the following: costs associated with guidance, counselling and school liaison services, financial assistance including the cost of purchase or rental of books, supplies, and equipment, etc. Eligible expenditures directly related to salaries and benefits, instructional and student support services, education program and delivery support services, school operating and maintenance costs, transportation and travel costs etc.		
Program eligibility requirements	To qualify as an eligible participant, a student must be: • aged from 4 to 21 years (or the age range eligible for elementary and secondary education support in the province of residence) on December 31 of the school year in which funding support is required • ordinarily resident on reserve • enrolled and participating in education programing in a First Nations, federal, provincial or a private or independent school recognized by the province • an Individualized Education Plan (IEP) must be in place or being created when a student has been identified by the school administration or a team of experts as having high-cost special education needs.			To be eligible for inclusion on the nominal roll, a student must be: • aged 4 to 21 years (or the age range for elementary and secondary education support in the province of residence) on December 31 of the school year in which funding support is required • ordinarily resident on reserve • enrolled and participating in education programming in a First Nations, federal, provincial or a private or independent school recognized by the province		
Overview of datasets used between 2007 and 2017	Dataset name	Years in use	Format in which it is currently stored	Dataset name	Years in use	Format in which it is currently stored
	Unknown	FY 2014-2015 through FY 2018-2019	Electronic	Unknown	2001 to present; however only data from FY 2012-2013 onward is reliable	Electronic

(continued on following page)

35 Services offered by HCSEP and Elementary & Secondary Education programs are updated annually. Please refer to program guidelines for different fiscal years to obtain the most accurate information on the services provided at the time.

Table 2.16 Overview of the Education programs at ISC and the availability and gaps in data they collect *(continued)*

	High-Cost Special Education Program (HCSEP)	Elementary & Secondary Education Program
Data fields available in dataset	The report data fields for the HCSEP for different fiscal years are available from the team.	The report data fields for the Elementary and Secondary Education Program for different fiscal years are available from the team.
Do fields contain information on gaps, denials, or delays of services?	Reporting is annual so specific dates are not available for needs related to individuals (i.e., date or request, date of decision, and date of service provision not available). The dataset does include information on the type of service offered. There also exists a variable to indicate why a drop-down data field for the reason a service was not fully provided. The data fields available are: Not Applicable, funding not available, service contract in progress, other, provider not available, actual costs higher than anticipated, student withdrew before end of school year. However, this field is sometimes used to provide information not related to the reasons services were not fully provided.	Reporting is annual so specific dates are not available for needs related to individuals (i.e., date or request, date of decision, and date of service provision not available). Respondents also indicated that details of request, reason for decision, type of service offered, date a service was offered, and difference between approved and requested amounts were not available in the dataset. Rather, a Yes/No indicator for students who receive services. Not deemed as reliable as the HCSEP report data.
Data limitations	The main caveat with these data is that regional interpretation of variables reported to ISC mean that comparison of data across regions is not reliable. Regional data will be helpful for analysis within regions but not across regions. In addition, as the data are reported annually, specific dates regarding individual service provision during the year are not meticulously documented. Block funding to regions is linked to services, but individuals receiving those services are not always clearly documented. Datasets combine local, regional, and historical data.	

Social services, policies, and planning department

The following programs within the Social services, policies, and planning development department at ISC may have data on certain services that are usually covered under Jordan's Principle: **Income Assistance**, **Assisted Living**, **Family Violence Prevention Program**, and **Urban Programming for Indigenous Peoples**.

Further exploration of the data holdings is warranted as the project team was only recently made aware of these holdings and was therefore not able to contact key respondents to obtain more detailed information.

First Nations Child and Family Services Program

For children involved in child welfare systems, some child welfare agencies sampled indicated that they collected information on certain children's health and social service needs during intake and assessment processes. Furthermore, the FNCFS program collects information on Special Costs (known as Additional Costs after FY 2013-2014), which refer to costs for children in care that are over and above the basic/regular maintenance rate and are not fundable through another source. This may be helpful in determining health and social service needs for some children. Please see Child Welfare Compensation Categories: Data Availability on p. 49 for some additional details on data related to child needs collected in child welfare systems.

Community-level data

Sources of community-level information provided by ISC include service provision, demographic and socioeconomic indicators. These may be helpful sources of data to support documentation related to individual requests for services, such as measures of remoteness or isolation.

The **Community-Based Reporting Template (CBRT)** is a national reporting template used to capture information related to programs in some First Nations communities. It was initially implemented in FY 2008-2009. It is used to support FNIHB program evaluation and planning. Accordingly, it collects information on what programs and services communities deliver, how communities implement certain programs, how community health systems operate, and select health status and health outcome data related to clients accessing FNIHB programs or services. Information regarding the data fields collected by the CBRT from FY 2013-2014 through FY 2017-2018 is found in the CBRT Data Dictionary in Appendix BB. Limitations of CBRT data identified by ISC contacts include the fact that it is not representative of all First Nations, the inconsistent interpretation and use across communities that do use it, and missing information. An expanded list of limitations is found in the CBRT Data Dictionary in Appendix BB. To determine availability and proximity to services, the information collected by the CBRT templates could be cross-referenced against a full list of communities to determine which communities do and do not have access to services.

The **Community Profiles Database** provides information on socioeconomic indicators and remoteness of First Nations Communities. This database is under the purview of Synergy in Action and collates demographic information by community, information regarding organizations within communities and agreements. Specifically, this includes band number and name, language, level of remoteness, and links with census profile from Statistics Canada. The guide to this system is available in Appendix CC.

While the CBRT and Community Profiles datasets do not provide information at the individual level, they do provide community-level information important for contextualizing individual challenges and proximity to services.

Additional data available outside of ISC

In the section below, we are including other sources of administrative and survey data that may be of use to help document denials, delays, and gaps in services for First Nations children. These are briefly listed for consideration.

Jordan's Principle coordination organizations

Early in the project, we met with several representatives of Jordan's Principle service coordination organizations who work with families to navigate Jordan's Principle requests across the country. Jordan's Principle data collection systems are varied not only by region but in some cases (e.g., Quebec) by community. A questionnaire to document the data systems used by Service Coordinators was developed and collected information about the scope and quality of data available. The questionnaire was sent to identified representatives, and/or individual Service Coordinators. Service coordination organizations only opened in 2017 (at the earliest) and therefore the information they held did not cover most of the eligibility period defined by the *2019 CHRT 39* compensation order, and the current AIP.

Census Data

Statistics Canada's Census tables and reports are a rich source of data which may provide information about socio-economic conditions that could help to explain greater needs for services and supports. The Census long-form (completed by a 25% random sample of respondents in 2016) includes several questions about "Aboriginal Identity", including whether the respondent is "First Nations (North American Indian)", whether they are a "a Status Indian (Registered or Treaty Indian as defined by the Indian Act of Canada)", and whether they are "member of a First Nation/Indian band." Using these categories, it is possible to compare First Nations people to any other population using the demographic and socio-economic data collected in the Census long-form. It should be noted that there are concerns about the completeness and accuracy of "Aboriginal status" in the Census. It also does not include information about use of social services, such as involvement with child welfare services, nor does it allow for the identification of children. Provincial and census tract information are also available, either in published reports or through special requests.[36]

Provincial and territorial health and social services systems

Not included in the scope of this project is administrative data from **provincial and territorial health and social services**. The data collected through administrative systems used by provincial and territorial health and social services settings may be valuable documenting that First Nations children experienced denials or delays in receiving essential services during the time period of interest. However, there are challenges regarding existing and accurate data related to race and ethnicity in Canadian health and social service settings. Use of these data may require identification of a child's connection to a First Nation through another mechanism.

Data documenting First Nation's children's needs when no request for services had been made

For situations where a First Nations child experienced a service gap *but no request for services was made*, we conducted additional research to explore what other available administrative and survey data sources may support documentation of children's needs. These are available in Appendix DD. This information may be useful if the current Jordan's Principle class is extended to include children who have experienced gaps in services, beyond those that have experienced denials and delays.

36 For example: Living arrangements of Aboriginal children aged 14 and under; Diverse family characteristics of Aboriginal changes aged 0 to 4; Data Tables, 2016 Census

Summary: Data availability related to Jordan's Principle compensation eligibility

Data related to Jordan's Principle compensation eligibility regarding delays, denials, and gaps in essential services will likely come from multiple sources at the federal, provincial, and local levels.

Jordan's Principle. Documentation of Jordan's Principle requests reflects the evolving trajectory of Jordan's Principle implementation since 2007. Prior to 2017, there was no *systematic* data collection although there may be ad hoc systems used in ISC regions that could some helpful information through a manual archival search. Due to a high level of turnover in Jordan's Principle staff, there is a loss of institutional memory. Table 2.10 on p. 78 summarizes the gaps and availability in Jordan's Principle data at ISC prior to fiscal year 2017-2018.

The most reliable and accessible data pertaining to Jordan's Principle requests is found in more recent years. Beginning in fiscal year 2017-2018, a more systematic approach to data collection was implemented to collect detailed information regarding requests, approvals, denials, as well as the date of a request and the date of a response, which can be used as a proxy for delay. A summary of information collected since fiscal year 2017-2018 is provided in Appendix S.

NIHB. Claims submitted to the NIHB for medical benefits, including prescriptions, equipment, and supplies are documented in multiple information systems according to the benefit type. These systems, and the availability and limitations of these data holdings, are documented in Table 2.12 on p. 81. NIHB data is limited to claims adjudicated under its purview, and includes information related to claimant name, date of claim, date of approval/denial, and reason for denial. Like Jordan's Principle information, this data is structured according to requests along with information about how the request was processed which may aid in assessing compensation eligibility. However, communication with NIHB staff indicated several important limitations of using this data for the purposes of supporting compensation. These limitations relate to: lack of detail on certain individual services due to NIHB contribution agreements and transfer arrangements with communities and contracts with service providers; underrepresentation of service utilization; lack of information on residency due to data tied to Indian Registration Number rather than residence; and the administrative nature of the system which does not accurately demonstrate approval rates. Despite these limitations, NIHB may be an important source of data to determine claimant eligibility.

Other ISC programs. We requested detailed information regarding data collected related to Home and Community Care, the Children's Oral Health Initiative, Mental Wellness, and certain programs from the Education department and the Social services, policies, and planning department. For programs that responded, no information exists on the dates of a request for services, the date of a decision, the reason for a decision, or the difference between approved and requested amounts. Only information about the client, the type of service provided and on what date that service was provided was available. This limits the capacity to use the information provided from these programs to identify children eligible for compensation under Jordan's Principle compensation categories.

Community level data. We identified two sources of community-level information that could be of use to the compensation process. First, the Community-Based Reporting Template is used to collect information regarding service delivery at the community level. Service delivery information collected using the CBRT could be cross-referenced with all communities to determine where this service delivery was not reported. Second, the Community Profiles Database, held by the Synergy in Action team at ISC, documents socioeconomic and demographic information about First Nations communities, including multiple indicators of remoteness and isolation. These data could be used to provide important contextual information regarding individual access to needed services.

Additional administrative and survey data. Additional administrative data from provincial and territorial health and social services could be useful to identify First Nations children who experienced a delay or denial of services. Given the focus of the current project, the project team did not meet with key respondents with information about these data holdings. However, this could be an avenue to explore when implementing the compensation process.

Concerns Expressed by Respondents Related to Availability of Data

In discussions with respondents regarding information related to the child welfare and Jordan's Principle compensation categories, there were substantive concerns related to the quality and availability of such information. These concerns related to data gaps, inaccessible data, lack of ability to document placement reasons, and diversity of definitions across jurisdictions. We have listed these concerns as a summary of the data availability section. Respondent concerns both mirror and highlight many of the issues that are documented in the sections above. In combination with the details included above, the issues raised by respondents may be of utility in the settlement agreement and compensation implementation processes.

Data gaps

Respondents were concerned that if the government relies solely on written documentation to support compensation, this could leave a substantial portion of eligible people claimants out of the process. Gaps related to pertinent information not consistently collected by agencies, and data that are not reliably completed in information systems could lead to anger on the part of claimants, which may be directed towards agency personnel impacting community relations.

There were some concerns expressed regarding inequitable receipt of compensation due to *bias* in availability of data. When gaps in data availability or accessibility is unevenly distributed across the eligibility period—with older data generally being less available, the requirement for claimants to provide documentation may create inequities in access to compensation. In many cases, this differential impact of data gaps reflects discriminatory funding that limited the ways in which a child's needs or welfare involvement were documented. Respondents were clear that if inequities in data availability translate to a lack of compensation for children who are eligible based on their experiences, this would itself be a manifestation of the discrimination the CHRT and class actions are aiming to redress.

Inaccessible data

Many respondents shared concerns regarding missing documentation of information related to service referrals or receipt (e.g., from a medical specialist) which could undermine access to compensation under the Jordan's Principle category. Access to documents that do exist may be compromised if professionals have died or retired, or a clinic has closed.

For child welfare data, particularly data documented in previous decades, much of the information is in a format that would need to be manually retrieved which is an onerous process for agencies.[37] Data may also have been archived, overwritten, or expunged due to jurisdictional or agency policy, or inadvertently due to IT problems or natural disasters such as fires or floods (as was the case in agencies in New Brunswick).

Placement reason

Several respondents identified challenges in linking the investigated or substantiated maltreatment type to the placement itself. For example, the reason a child came to the attention of a child welfare agency (e.g., substantiated physical abuse) would typically be documented early on in the service continuum, while a placement may happen later and is not always directly due to the initial maltreatment concern. We also heard concerns that many removals could have been avoided if other services had been available, leading to a suggestion that many removals, even those related to abuse, could be assumed to be "unnecessary" (according to the CHRT language) unless otherwise documented.

Concerns were raised regarding information that is not consistently documented but may relate directly to reasons for placement. A common example was information related to poverty and other socioeconomic challenges which are relevant for removals but may not be documented related to specific individuals in a community given that it may be a common occurrence in the community. Some respondents suggested that socioeconomic information known about communities (e.g., at SIA) be considered.

37 Dates electronic systems (rather than paper records) were implemented vary across jurisdictions. In our review of data back to 2006, we found some systems were in place before that year, and others were implemented more recently (please see Appendix P for details).

Diversity of definitions

Concerns related to variation in practices across Canada with respect to different child welfare concepts are defined and operationalized in child welfare practice and information systems. Given Canada's decentralized child welfare system, simple concepts, such as the exact definition of out-of-home placement are not understood in the same way across different provinces (or agencies). For example, kinship placements are defined and identified by workers in different ways (e.g., some may be documented as a foster placement). Further, kinship care often includes extended family and people close to the child such as friends or neighbours.

As a result of these concerns, respondents expressed the need for clear, easily operationalized explanations of constructs used to identify claimants. This included concepts such as removal from "home, family, and community" if this was used to determine individual eligibility.

III. Considerations for the Compensation Process

Description of Approach

Our approach to the second part of our mandate – to provide considerations for the compensation process – involved three main elements. First, in our discussions with respondents regarding availability of data for child welfare and Jordan's Principle compensation categories, we documented concerns that came up regarding the compensation process itself. Second, we conducted an extensive review of Canadian and international settlement processes and summarized lessons learned from these past processes that may be of use in the present context. This involved review of academic and "grey" literature along with publicly available information, and interviews with individuals with experience related to past Canadian settlements. Third, we conducted a review of social science literature regarding retraumatization, a notion which came up repeatedly in our review of past settlements. Finally, we reviewed considerations from respondents, past settlements, and retraumatization literature and compared them to the *Final Compensation Framework* to identify areas that may be useful in finalizing details of the settlement agreement. Considerations that emerged from these activities are provided in detail in the sections that follow.

Compensation Process Concerns and Considerations Expressed by Respondents

In our consultations with stakeholders, several process-related concerns have arisen regarding the eventual implementation of compensation. Broadly, these process concerns relate to data confidentiality and ownership, the burden on agencies participating in the process, and ensuring eligible individuals are able to access the compensation that is due to them and to receive support after they receive compensation.

Data confidentiality/ownership

Some FNCFS agencies have expressed concern about the possibility of sharing their data to help identify children given past misuse of data and current concerns about the confidentiality of the children and families with whom they are working. A key concern for FNCFS agencies is how central administrators will be given the mandate to obtain identifying information about children and families to create a "pool of eligible applicants" as per the Compensation Framework. Questions have arisen regarding who has the authority to disclose or access the information held at the agency level. This relates both to individual privacy concerns and broader questions of how the process will align with OCAP® principles (FNIGC, n.d.). First Nations agencies have expressed that even when they use the provincial administrative data system, the data on children in local communities is still locally owned. These questions relate to a broader lack of clarity: who ultimately says what data on eligible children and families can be used for and who will access it? One distinction that has been raised in our discussions is that agencies could go directly to individuals to let them know they may be eligible, but if an agency were to share confidential information directly with the government, this could pose challenges to both individual confidentiality and local ownership of data. Our discussions have raised the suggestion of ISC utilizing data they have already collected to initiate contact with individuals. This may include, for example, contacting individuals whose registration number is recorded at ISC and meet basic eligibility requirements.

Agency responsibility

While the CHRT decision holds the federal government accountable, child removal decisions are made at the agency level. Especially in small communities, the *ongoing* nature of child welfare eligibility creates a morally uncomfortable situation for these agencies. Specifically, we have heard concerns regarding possible blame on CFS agencies who removed a child, but who are also helping claimants access compensation. The moral stance of agencies, particularly locally governed, delegated FNCFS agencies in small communities, will be challenging because of this dual role that agencies may need to play in implementing the compensation order. The lack of anonymity in small communities could add to these challenges. Many agencies highlighted the fact that using the term **"unnecessary"** removals in the *2019 CHRT 39* order only exacerbates this issue, by suggesting that agencies themselves wrongfully removed children. Ultimately, this puts agencies in a difficult position: while the federal government has been found liable for reckless discrimination against First Nations children, by identifying children, agencies could be wrongfully subject to liability for these removals. Ultimately, it will be necessary to ensure that at each stage of the compensation process, the responsibility lies with the federal government.

Agency capacity

While the CHRT decision aims to alleviate the burden on individual claimants, a standard of proof requiring documentation to be eligible for compensation will inevitably involve agencies. Communities have indicated that they are already overworked and are concerned that they won't have the necessary time and resources to help identify claimants. Recommendations have been made to hire more staff to account for this anticipated increase in workload. Agencies have suggested that their participation would put them in a difficult situation for several reasons, including the logistical burden it could entail. Because of the broad scope of eligibility, agency contacts have proposed that putting the burden on the federal government to prove a child is *not* eligible would relieve this agency burden. Similar suggestions have been made regarding proof of First Nations identity. In addition, if agencies are required to support documentation of eligibility, resources would be required.

Access to compensation process

Concerns regarding individuals accessing the compensation process have been mentioned. Key stakeholders have mentioned that they are worried that eligible individuals who are especially vulnerable or isolated will be excluded from the process. For example, First Nations individuals who live in urban areas and don't have the same connection to an established First Nations community may be harder to reach. Multiple contacts have proposed that eligibility for Jordan's Principle compensation categories could be applied to all children in certain communities, given gaps in services available in those communities. Because this would be burdensome to prove at the individual level, contacts have suggested that discretion should be used in terms of what is considered "proof."

Support to compensation claimants

We have heard concerns regarding the need for support for those receiving compensation payments who may be particularly vulnerable. While this should not in any way deny or defer the right of individuals to receive the payment, there are concerns regarding an influx of cash having negative impacts in some cases. We have heard many suggestions for the compensation process to ensure adequate support is available to mitigate this risk.

Exploring Lessons Learned From Canadian and International Approaches to Compensation Agreements

Graham Rotenberg and CHRT Compensation Project Team

Summary of key lessons learned

The process of compensating marginalized groups for past persecution is complex and requires thoughtful planning. Canada, Australia, New Zealand, Germany, and many others have settled lawsuits and created compensation schemes that aim to repair, to the extent possible, harms they perpetuated. These schemes aim to compensate, mainly Indigenous, victims of child removal and cultural genocide. Although each scheme is procedurally different, they teach consistent lessons about: 1) effectively communicating with the target group, 2) creating claimant-friendly application processes, and 3) leveraging technology to execute these processes efficiently and cost-effectively. High level lessons-learned from past settlements, as they relate to different phases of the compensation process, are as follows:

Notifying claimants

Simplify notice plan. Ensuring applicants are aware of the existence of a compensation scheme is essential to its success. However, notice plans have created confusion in target communities. Calling for applicants should clearly explain the eligibility criteria where possible and describe how to troubleshoot intake issues. All explanations of the eligibility criteria should be explained using plain, widely spoken languages, and be explained in an easily legible, accessible manner for claimants. Consultative design of the notice plan that engages stakeholders who will be directly affected will improve accessibility and clarity of communications regarding the compensation process.

Tailor communication to different audiences. Notice plans have prioritized calling for applications in Canada's official languages, thereby ignoring Indigenous communities' preferred language and modes of communication. Reaching communities where they are located is essential to maximizing the number of applicants and ensuring compensation schemes promote reconciliation and healing. Developing communications plans by age, geography, band, agency, etc. can increase applications, reduce costs by limiting difficulties processing incomplete applications, and promote reconciliation by curbing application processing times and ensuring claimants receive compensation as quickly as possible.

The application process

Consider participatory, Indigenous-led design of application processes. Centring and being more attentive to Indigenous legal paradigms and community supports can more faithfully advance reparative justice initiatives. Western legal systems should not be all-encompassing. Indigenous legal traditions should be incorporated explicitly, or entirely, in providing legal remedies. Spatial and temporal restrictions on eligibility that comport with exclusively Western legal ideas should be minimized wherever possible.

Simplify forms. Every compensation process requires a claimant to complete an application. Claimants have criticized these processes because applications are lengthy, deploy legalistic language, and overemphasize the burden of producing documentation on claimants to support their claims; this process is intrinsically retraumatizing and costly. Forms must be more user-friendly by becoming shorter, being conveyed in multiple (Indigenous) languages, and including visualizations to simplify instructions. Both paper and online options for application completion should be available to accommodate diverse Indigenous communities.

Accommodate progressive disclosure. Progressive disclosure – the process by which a claimant reveals more about their abuse or trauma as they build trust with others – has largely been absent from determinations about the length of the compensation period. Allowing for application extensions and broadening the window of eligibility for compensation could help application processing procedures become more accommodating of claimants needs and aware of the pressures of retraumatization.

Provision of adequate legal support. Past processes have not had free legal advice or appropriate application supports available for claimants. Many applicants experienced fraud, were retraumatized by overly jargonistic language, and did not feel as though they had the inclusive supports they needed. Providing legal support free-of-charge, understanding literacy rates in the community, conferring with community leaders to determine the types of supports preferred, and having a flexible review process will improve compensation processes.

Provision of sufficient mental health supports. A toll-free helpline is necessary but may not be sufficient to support the mental health needs of many individuals and communities affected by the compensation process – especially if it is

understaffed. Indigenous healing supports, in addition to in-person mental health resources and counselling, are crucial.

Provision of sufficient administrative supports. Hiring an adequate number of trained staff to assist claimants in a community-centric manner is essential to an effective implementation of a compensation regime. A well-staffed, culturally- and trauma-informed team of attendants would improve compensation processes. In addition, having support staff working directly with communities, such as community liaisons, can render compensation schemes more efficient and help tailor implementation to community needs.

Processing of claims

Implement reasonable processing capacity. Multiple compensation processes have been more popular than anticipated; meaning high application volumes and overwhelmed staff, resulting in reduced capacity for claims administrators to process applicants in a timely manner. Claimants feel that this is tantamount to a broken promise, as they wait for months, and sometimes years, to receive a decision. For administrators, it means they begin processing applications at a disadvantage – there are too many applications and too few reviewers. Planning for the worst is important – meaning hiring more staff than needed, especially at the beginning of the notice plan, and leaving time to prepare between the compensation decision or agreement and the beginning of the call for applications.

Clearly communicate to manage internal and external expectations. Given repeated examples of long delays in processing applications, it is essential to set expectations with claimants on the length of time it will take to process applications. Further, government contractors and internal stakeholders must set reasonable timelines and have a clear-cut understanding of how the application process will function to ensure consistency in communication with claimants and administrative staff.

Build and test technological capacity. Inconsistencies in the application of technological processes across and within organizations by claims administrators and users have led to significant issues. Higher-than-anticipated application volumes have slowed the efficacy of largely untested, algorithmic tools. Claims administrators should test application processing tools prior to implementation and train users on ways to consistently adopt the software. Ultimately, technology is a useful tool, and it can lead to more efficacious and efficient processing of compensation. However, it is no panacea for ensuring quick processing of blanket compensation payments, especially in the face of inconsistently available data.

Introduction

In order to identify considerations related to the CHRT compensation process, we reviewed previous Canadian and international compensation and remediation frameworks with similarities in scale, issues, and breadth of implementation. Specifically, we researched what shape they have taken, how they were implemented, and what lessons have been learned that can be of use to the present compensation process. This section provides a summary of this review, with specific, actionable lessons learned fom previous compensation and remediation frameworks. Our search strategy included academic papers, grey literature, conversations with individuals involved in select processes, and publicly posted materials related to the settlements identified.

Compensation is a fundamental remediation feature of most of the settlement agreements explored in this report. Justification of compensation in settlement agreements is philosophically undergirded by a variety of principles including recognition of harm, recognition of individual human rights, and deterrence of future violations (Mahoney, 2018). However, the mechanisms that have been used to provide compensation vary considerably, both domestically and internationally. The lessons learned from these settlement agreements provide important cautionary tales. One conclusion is clear: centring claimants' needs is essential to developing a durable framework prioritizing intergenerational and cultural healing.

After providing an overview of the settlements reviewed, this paper is divided into three parts, exploring the lessons learned from three aspects of the life cycle of a reparative scheme: 1) the notification of claimants, 2) the application design and support processes in place, and 3) the processing of claims. **The first part** discusses how claimants have been identified via public notice plans, exploring how those plans can be more inclusive and accessible. **The second part** describes the necessity of support for claimants when navigating the application process and outlines how they can be better integrated into future schemes. **The third part** discusses how technology and claims administration can be harnessed to minimize exclusion from the compensation process.

Given that our review of past settlements has demonstrated that accessing restitution without proper support can re-trigger past trauma, the section following this one reviews in more detail the social science literature on retraumatization and the specific mechanism that can trigger it within justice-seeking processes (see p. 117 for A Closer Look at Retraumatization).

Brief overview of settlements reviewed

Before exploring lessons learned, we provide a brief overview of past Canadian and International reparative schemes that are referred to throughout the body of the report. A more detailed review of each settlement is provided in Appendix EE.

Canadian compensation schemes

Indian Residential Schools. In 2006, the Government of Canada, the Assembly of First Nations, churches, and other Indigenous organizations reached an agreement to compensate former victims of Canada's residential school system for Indigenous students (Government of Canada, 2021). It was, until now, the largest class action settlement agreement in Canadian history. Total compensation was estimated at $1.9 billion. However, the total amount awarded was over $4 billion (Government of Canada, 2019). The settlement agreement had three main vehicles of compensation. First, every former student of a residential school who was separated from their family to attend the residential school received a lump sum – the Common Experience Payment. Second, students who were sexually and/or physically abused were compensated using a point system called the Independent Assessment Process. Finally, and beyond the scope of our research, were ongoing general education programs (e.g., the Truth and Reconciliation Commission) and cultural and mental health supports (Indian Residential School Resolution of Canada, 2007).

Sixties Scoop settlement agreement. Between 1951 and 1991, Indigenous and Inuit children were apprehended from their families and communities by provincial child welfare authorities and placed with non-Indigenous foster parents (*Riddle, White, Charlie v. Her Majesty the Queen,* 2018). These children were not raised according to their cultural traditions and were not taught traditional languages. This tragic chapter in Canadian history is known as the "Sixties Scoop." The purpose of the settlement agreement is to bring a "comprehensive and lasting resolution" to the legacy of the Sixties Scoop by promoting healing, education, reconciliation, and commemoration (*Riddle, White, Charlie v. Her Majesty the Queen,* 2018, p. 40). Any "registered Indian" pursuant to the Federal Indian Act or Inuit individual who was taken away from their parents is eligible for compensation. The implementation of the agreement is ongoing.

Federal Indian Schools settlement agreement (Day Schools). On March 12, 2019, Canada settled in a nationwide class action for harms suffered attending federally operated Indian Day Schools (*Mclean, Augustine, Commanda, Sampson, Swan and Buckshot v. The Attorney General of Canada,* 2019). Between 1863 and 2000, the Government of Canada operated nearly 700 schools for Indigenous peoples in Indigenous communities. At these schools, students suffered psychological, physical, and sexual abuse – and were subject to the same curriculum as the one provided in residential schools (Federal Indian Day School Class Action, n.d.). The goal of the settlement agreement was to tell the truth about victims' experiences, promote reconciliation, and healing. The implementation of the settlement is ongoing, and the claims deadline is in July 2022 (Federal Indian Day School Class Action, n.d.). Any former day student who suffered abuse or harm while attending the school is eligible for compensation

Case example: Motherisk

From 1990 to 2005, the Motherisk Laboratory tested 24,000 samples for drugs and alcohol from over 16,000 individuals for child protection purposes. The testing was deemed inadequate and unreliable for use in child protection and criminal proceedings. In response to these findings, the Ontario Government created the Motherisk Commission to review cases and provide resources to assist people who have been affected by testing. The Commission reviewed 1,271 cases to determine whether the lab results had a substantial effect on the outcomes of cases involving parental rights (Ministry of the Attorney General, 2018). In 2017, Green argued that Sick Kids' Motherisk lab was "systemically negligent" by conducting unreliable tests that were relied on to cause a range of harms (e.g., loss of parental rights) to the test takers (*Green v. The Hospital for Sick Children*). Green failed to persuade the Court that a class action was a "preferable procedure" to other modes of litigating the dispute; namely, litigating the cases individually. Although financial compensation was not provided to the class, this case was analyzed because of its extensive use of administrative data to identify individuals affected by Motherisk's flawed testing methodology.

Australian compensation schemes

Australia – unlike Canada – has approached compensating its "Stolen Generation," Indigenous students taken from their families and placed in residential schools and with non-Indigenous parents, regionally and via statute. Rather than have separate compensatory frameworks for forced adoptions and residential schools, Stolen Generation compensation schemes have

aggregated these two harms. The Australian government's child removal policies are very similar to Canada's 20th century policies where Indigenous students were taken from parents and placed in non-Indigenous homes and forced to attend residential, segregated schools.

Compensation schemes for "Stolen Generation" students have been passed on a state-level in Tasmania, South Australia, and New South Wales. The Tasmanian model was generally adopted in the other states with *de minimis* alterations. Although this model suggests an alternative structural path to reconciliation and reparative justice, the narrow eligibility criteria and substantially smaller number of claimants limits the scalability of the approach. In fact, plaintiff-side counsel in Australia have cited Canada's approach as a more robust and inclusive compensation framework, notwithstanding the challenges of implementation here.

Tasmania. In 2006, the state of Tasmania's legislature established a $5 million fund to compensate members of the Stolen Generation. The Act became operational at the beginning of 2007, and in total there were 151 claims received, and 86 claimants were eligible. (Tasmania Department of Premier and Cabinet, 2008). A total of 84 members received slightly over $58,000 AUD each, while two deceased members of the Stolen Generation received individual amounts of $4,000 and $5,000 AUD respectively (Tasmania Department of Premier and Cabinet, 2008). The fund was the first of its kind in Australia. To be eligible, claimants needed to 1) self-identify as Aboriginal; 2) have Aboriginal ancestry; and 3) be communally recognized as being Aboriginal.[1]

New South Wales and South Australia. The New South Wales and South Australian processes began in 2017 and 2015, respectively. They had similar features to the Tasmanian agreement. They required applicants to be Aboriginal and to be removed from their family before 1969 in New South Wales and 1975 in South Australia (Government of South Australia, 2018; Aboriginal Affairs New South Wales, 2021).

New Zealand processes

Throughout 2020, the Waitangi Tribunal heard claims that a disproportionate number of Māori children (tamariki Māori) had been taken into State care. As of 2017, Māori children constituted more than 60 percent of the children in care, and recently, Māori children were five times more likely to be in state care than their non-Māori counterparts.

New Zealand's unique approach process claims involved the creation of a "permanent commission of inquiry" – or tribunal – designed to make recommendations of claims brought by Māori related to alleged breaches of the Treaty of Waitangi – a major treaty governing Crown-Māori relations in New Zealand (Waitangi Tribunal, 2021b). The Tribunal has three primary powers. First, it makes recommendations on the dispensation of violations of the Waitangi treaty. Although the Tribunal can make recommendations, those recommendations are not binding – a stark difference from compensation decisions in previous regimes. Second, and importantly, the Tribunal is a specialized body that has exclusive jurisdiction over the treaty and its legal effect. Finally, the Tribunal can make determinations on certain legal issues (e.g., land/water rights) between the Crown and Māori (Waitangi Tribunal, 2021c).

After hearing submissions by interested parties, claimants of treaty violations, and the Government of New Zealand, the Tribunal released its report in April 2021. The Tribunal's order broadly recognized the New Zealand Crown's perpetuation of harm on Māori children. The recommendations omit a strict, time-defined compensation process; instead, the Waitangi Tribunal proposed significant legislative and systemic policy changes to create a more equitable framework from safeguarding child welfare. (e.g., Waitangi Tribunal, 2021a).

Israel and Germany compensation schemes

The Holocaust is among the worst tragedies in human history, constituting a genocide of approximately six million Jews (men, women, and children) and millions of others, including political and religious dissidents, ethnic minorities, and LGBTQIA individuals (United States Holocaust Museum, 2020). In the early 1950s, the German government, Jewish organizations, the United States, and Israel, *inter alia*, provided funding for the formation of the Conference on Jewish Material Claims against Germany (the Claims Conference). The Claims Conference is a quasi-private organization responsible for negotiating reparative compensation for Holocaust survivors and memorialization of the Holocaust. The organization's function is two-fold: 1) to obtain funds for the relief, rehabilitation and resettlement of Jewish victims of Nazi persecution, and 2) to aid in rebuilding Jewish communities and institutions that were devastated by the Nazis (Claims Conference, n.d.).

1 Note: this is exceptionally similar to the criteria adopted by the Supreme Court of Canada for determining Métis heritage in Pajamewon.

Since the formation of the Claims Conference, its role has evolved and expanded – often to obtain compensation for a larger universe of Holocaust survivors. There are three general forms of compensation available to survivors, which include: 1) indemnification (compensation for specific persecution-related losses or damages, including harm to a victim's health or loss of professional opportunity); 2) reparations (payments in money or materials from one nation to another for damages inflicted during a conflict, and in this case, a genocide); and 3) restitution (return or recovery of identifiable assets, including machinery, real estate, business enterprises, and cultural properties that are restored to the original owners – nations, communities, institutions or individuals).

Our review of past settlements identified a number of lessons related to the three stages of the cycle of a compensation scheme: notification of claimants, application process, and claims processing. These are detailed in the sections below.

Notifying claimants

Overview

For effective implementation of a compensation framework, eligible participants must be aware of the agreement and the opportunity to receive payment. Thus, every compensation framework we investigated included a Notice Plan. Reaching prospective claimants can be difficult because different communities have different levels of need. Each framework, therefore, included digital and traditional media campaigns to raise awareness about the process. Unsurprisingly, some strategies were more effective than others. Ineffective strategies often resulted in claimants feeling ignored and retraumatized, because claimants were unaware that they could participate in the process despite being eligible. They felt left behind. Therefore, any successful communications strategy must put claimants first, and conduct outreach to claimants using media that the target community actually uses, rather than blindly adhering to a multi-channel approach. Targeting is necessary for successful implementation of a compensation framework.

Notice plans in the settlements reviewed in this report are summarized in the following table. More detailed information regarding the notice plans can be found in Appendix EE.

Table 3.1 Notice plans in Canadian and International compensation regimes

Compensation regime	Notice plan summary
IRSSA: Common Experience Payment (CEP) and Independent Assessment Process (IAP)	Notice plan implemented by Hilsoft Notifications. Multi-channel campaign targeting Indigenous peoples aged 25 and over using direct mailing to claimants and general advertising (newspaper advertisements, informational news releases, Indigenous publications, etc.). In parallel, IRSAS – the Government of Canada's oversight body of the compensation agreement – also developed its own National Outreach Strategy designed to make claimants aware of the IAP program.
Sixties Scoop	Notice plan implemented by Argyle PR. The campaign included: messaging around key milestones, media engagement, and social media, print and television publications to engage the public and raise awareness about the Sixties Scoop process, with advertising and direct communications in French and English.
Federal Day School	Gowlings WLG took responsibility for contacting a large group of class members directly, given the size of the registered class. Gowlings had contact information for approximately 80,000 members of the class. Like the Sixties Scoop Settlement agreement, Argyle PR was retained to develop and upload media services and create a communications strategy targeting Indigenous and mainstream earned and paid media, using English, French, and four other Indigenous languages.
Motherisk	N/A
Australia (Tasmania, New South Wales, South Australia)	Advertising campaign targeting Indigenous media, information sessions, and direct mail to Aboriginal organizations.
New Zealand Oranga Tamiriki (Waitangi Tribunal)	Claimant-driven. The tribunal receives complaints from organizations and affected parties to launch an inquiry.
Holocaust Reparations	Limited. Eligible claimants suggest they are largely unaware of the scheme.

Lessons learned

Lack of participatory communications strategy

In past settlements, a participatory communications strategy involving members of the eligible class or group of claimants may have alleviated confusion about the compensation process. For example, in the IRSSA, many claimants wished they had been invited to participate in the design and dissemination of messages about the settlement. Prior to implementation, a group of residential school survivors had convened to flag concerns about the process, including that there should be a "survivor-led, trauma-informed communications strategy" (p. 35, NCTR, 2020). However, these concerns were not implemented and resulted in a communications process that did not reflect the voices of survivors and an outreach to respondents that was often under-inclusive. For example, survivors in remote communities struggled to receive the information they needed and felt that they had little say in the process.

Inaccessibility of information: Language, format, and technology

Consideration of claimants' language, preferred format to receive information, and access and use of technology may have improved the dissemination of key details about compensation. In some past settlements, what information was available was not always available in **languages** spoken by survivors, meaning many survivors did not have the information they needed in languages they spoke in order to apply. Additionally, information was often conveyed in an inaccessible format that did not adopt **Indigenous communication modalities** – namely "building networks of family contacts" and "frontline workers who could share information orally" (p. 35) and in Indigenous languages (NCTR, 2020). Furthermore, some residential school survivors with hearing loss, which was often the result of the abuse they had suffered, were not provided with information in alternative formats (NCTR, 2020).

Accessibility is particularly important as it relates to **technology and internet access**. The lack of reliable internet access for Indigenous communities was a substantive barrier for effective technological use in implementing previous Canadian settlement agreements. For example, in the IRSSA many communities of survivors "were isolated" and "technology was not available for a lot of people," leaving no "accessibility to the compensation" at all for some eligible individuals (NCTR, 2020, p. 65). Communication cannot be "solely or even predominantly internet-based" (NCTR, 2020, p. 65). Other forms of technology that are available, like radio, newspapers, flyers, or faxes should also be used, and used more heavily, to reach the target community (NCTR, 2020).

If the notice plan includes in-person events, it is essential that they are targeted and well advertised so community members can participate.

Ultimately, a precondition for claimants to use internet or broadband to access information on settlements inherently disadvantages Indigenous communities that do not easily have access to the internet (Samuel Centre for Social Connectedness, n.d.). Indigenous communities in Canada have unequal access to high-speed internet. The digital divide between settler and Indigenous communities is, by some estimates, wide (Internet Society, 2020; Samuel Centre for Social Connectedness, n.d.). The diversity in internet connectivity must therefore inform how technology is used to inform eligible claimants, troubleshoot issues, and accept applications. Varying technological capacities is especially relevant for children and young people who, depending on their age, may use technology in very different ways than adults do.

Lack of clarity and intentionality in communications

The **clarity** of language used in communications is important for effective dissemination of a notice plan. Communications must explain in clear terms what claimants ought to do to succeed on applications. In the past, claimants have complained that the eligibility criterion were unclear. For example, the NCTR (2020) report highlights how both components of the IRSSA did not explain clearly the implications of signing waivers, or what key concepts like "physical abuse" or "loss of income" or "confinement" meant. Although these are legal concepts, at the heart of the settlement agreement, public-facing communications should use culturally appropriate and sensitive language that can easily be understood.

The Federal Day School settlement has had similar difficulties, where key concepts and resources have gone unexplained. For example, in March 2020 the Federal Ombudsman sent a letter stating that implementation of the Day School settlement agreement was "not fully serving the needs of survivors" because there was no plain language explanation of the settlement with links to resources available on the Government's website (Office of the Federal Ombudsman for Victims of Crime, 2020). The Federal Ombudsman implored the Federal government to advance funds to communities to enhance resources for face-to-face interaction with community members. Misunderstandings can result from poor initial communication about the process: in the IRSSA, some survivors believed that they would be unable to attend church if they applied for compensation. This led fewer claimants to apply and led some to miss the application deadline. This diminished the

efficacy of the compensation regime, fuelling distrust and limiting the number of applications (NCTR, 2020).

Although it is essential to use plain language to help inform applicants about the process, if that language is **inappropriate** to the target audience it can reduce the number of applications from eligible claimants. For example, during the Motherisk Commission's notice plan, a poster was used to reach out to claimants in schools. The contents of the poster "stirred controversy" because it asked if children were "taken" from their parents (Ministry of the Attorney General, 2018). The intention was to use language that was easy for high school students to understand, but instead the poster was inadvertently sent to elementary schools. Children's Aid Societies criticized the poster for its language, while others supported it. Ultimately, the Ministry responded by removing the poster from all schools given its inappropriate use of language (personal communication, member of the Motherisk Commission).

Key lessons learned – Notifying claimants

Challenges. Claimants have been critical about prior communications plans because they are not inclusive, unavailable in their spoken and written languages, and relied on technologies that some claimants did not use.

Opportunities. Harnessing the power of the provincial or federal government to notify claimants – in a privacy-focused way – is an effective tool for conducting outreach. Given the lessons outlined above, claimant notice plans should consider the following:

- **Participatory design of the notice plan.** Consultative design of the notice plan that engages stakeholders who will be directly affected will improve accessibility and clarity of communications regarding the compensation process.
- **Prioritizing accessibility of the notice plan.** A diverse variety of communication methods and events are needed to ensure eligible claimants receive pertinent information regarding the process. It is important to consider language, hearing/sight abilities, and access to technology and the internet.
- **Clear messaging regarding the process.** Ensuring that the content of the notice plan clearly states the scope of eligibility, requirements for applying, and the rights and responsibilities of applicants will help alleviate the burden and potential confusion for individual claimants.

Applying for compensation

Past compensatory regimes have illustrated some cautionary lessons regarding the process of applying for claims, both regarding the application design itself and the support provided for claimants. The design and structure of the application process must consider claimant experiences. At best, a well-designed compensation process can promote reconciliation by ameliorating trauma and recognizing past harms. At worst, implementation can frustrate that purpose by forcing claimants to relive their suffering. Consideration of the procedural complexity of applying, the burden of proof on applicants, and possibilities for supporting claimants in the application process (legally, administratively, and emotionally) should be part of the application process. These are explored in more detail in the subsections below.

Lessons learned: Designing the application process

The application design for compensation in the settlements reviewed in this report are summarized in Table 3.2 on p. 104 More information regarding the application processes can be found in Appendix EE.

Enforced Western legal processes

The formal, legalistic process inherent in many past compensation regimes reflects a Western legal paradigm that can be alienating for claimants. The IRSSA process (and in particular the IAP) is a particularly illustrative example in that it emphasized temporality rather than Indigenous-centric healing processes. Some survivors were unfamiliar with a complex legalistic process. Some even compared the IAP process to residential schools because they were "taken from their communities, brought to buildings that were like compounds, victimized by re-telling their stories in a culturally unsafe manner, and then returned to their communities" (NCTR, 2020, p. 32).

The timeline was dictated by adjudicators and the government, and healing and claimant-readiness was not adequately considered (Petoukhov, 2019). Survivors were compensated based on the "spatial and temporal arrangement imposed on them" (pp. 184–185) by the Canadian legal system (Petoukhov, 2019). For instance, one survivor's claim was denied because she was sexually abused "outside of school property" – even though the abuse was perpetuated by a school employee "mere feet […] on the wrong side of the property line" (Petoukhov, 2019, p. 115). Finally, many IAP adjudicators and CEP processors had never experienced working with survivors or Indigenous peoples and therefore did "not have the cultural competence" (p. 40) required to build a rapport with survivors (NCTR, 2020).

Table 3.2 Application design in Canadian and International compensation regimes

Compensation regime	Eligibility criteria	Remedy	Length of application window	Burden of proof
Common Experience Payment (IRSSA)	Former attendees of a recognized Indian residential school.	Lump sum payment, $10,000 initial sum for the first year of attendance, $3,000 for each subsequent year attended	5 years	Mixed. Claimants were required to complete an application that asked for basic biographical information, governmental identification, and information about the time, place, and duration of time spent at a residential school. Applications were required to be notarized and needed to be witnessed. Claims were verified via an automated system using governmental records.
Independent Assessment Process (IRSSA)	A victim of sexual and/or physical assault perpetuated by a teacher or student, or other wrongful conduct resulting in serious psychological consequences.	Victims received a lump sum payment between $5,000 and $430,000, that depended on the "level of abuse" through a point system.	4 years	Mostly claimants. Claimants were required to attend hearings, answer questions identifying their accuser, and describe the date, type, and frequency of abuse. If an applicant rated their abuse above a certain level, they were required to provide specific types of evidence (e.g., hospital, treatment, psych. records, income tax, etc.)
Sixties Scoop	Registered Indians who were removed from their homes between January 1, 1951 and December 31, 1991 and placed in the care of non-Indigenous foster parents.	Lump sum payment, expected to be between $25,000 and $50,000 per claimant	5 years	Claimant had the burden of providing biographical and identification information, records of adoption, and had the option of writing their personal story and experience.
Federal Day School	Individuals must have attended a) Federal Day Schools and b) suffered abuse or harm at the school. Harm and abuse included both physical and sexual abuse and was determined based on a sliding scale.	Lump sum payment, between $10,000 and $200,000.	5 years	Burden of proof is on the claimants. The amount of evidence depended on the seriousness of the claim. Claimants had to provide identification, evidence of a school attended, and write a written narrative of events. For more serious claims, claimants were required to produce family/friend narratives, other records, and medical, dental, and therapy records. No oral hearings were required.
Motherisk	Individual child protection cases between 1990 and 2015 where testing conducted by the Motherisk Laboratory had a "substantial impact" on the court's decision.	No compensation. Instead, the Commission provided referrals to counselling services (paid for by Government of Ontario), legal advice, and information collection.	2-year mandate, 5 years for counselling (see Remedy).	The Commission and Children's Aid Societies in Ontario bore the burden of reviewing claims and finding eligible claimants. The Minister of Children and Youth Services issued a policy directive to identify all cases where there was a Motherisk test.
Tasmania (Australia)	Legally recognized Aboriginals who were removed from their families before 1975.	$5 million AUD, dispersed depending on the category of harm.	1 year	Mixed. Applicants required to complete a form and supply various levels of proof. An independent assessor searched government records to corroborate the applicants claim.
New South Wales, South Australia	Legally recognized Aboriginals who were removed from their families before 1975 (South Australia) or 1969 (New South Wales).	New South Wales: $75,000 AUD and $7,000 AUD for funeral expenses South Australia: $20,000 AUD	New South Wales: 5 years South Australia: 1 year	Similar to Tasmania. Applicants provided biographical information and documents to prove their identity and assessor verified claim. However, less of a burden is placed on claimants compared to Tasmania, because claimants merely signed a release enabling the government to search documents to provide proof of the claim. Most also had an interview with an assessor.
New Zealand Oranga Tamiriki (Waitangi Tribunal)	Māori whose children were "taken under state care."	Report and recommendation that New Zealand's settler government delegate more responsibility over Māori children to Māori governmental agencies.	Ongoing	Inquisitorial model. After a claim is sent for review, the Tribunal sends a team of historians, lawyers, and ex-judges who constitute the tribunal to hold hearings and find facts.
Holocaust Reparations	Different compensation frameworks for people suffering hardship (e.g., escaping a Nazi-regime), incarcerated in a camp, child transportation, or was a spouse of a victim.	Some ongoing payments (580 EUR per month for the Article II Fund), and other lump sum payments.	Ongoing and evolving types of compensation	Mixed. Claimants had to produce "documentary proof of their dispossession."

Power dynamics between adjudicators and survivors also ran counter to the reparative and reconciliatory goals of the settlement agreement. By design, the IAP process required full disclosure to be eligible for compensation, irrespective of the claimant's preparedness. Compensation was only awarded if there was "sufficient evidence" based on "precise and in-depth disclosure" (NCTR, 2020, p. 29). These evidentiary sources emphasize certain life experiences as deserving of compensation, while discarding others because they do not conform to accepted discourses of victimization. IAP claimants were forced to fit their often non-linear, complicated experiences within Western standards of health, wellness, and body in order to receive compensation (National Centre for Research for Truth and Reconciliation, 2020).

The **definition** of who constitutes a member of an Indigenous community is another example of a legal concept that, when strictly interpreted, results in a harmful and exclusionary experience for claimants. Legal scholars, sociologists, First Nations, Métis, and other Indigenous communities debate about how this can be defined. In Tasmania, the Assessor often did not decide who was and was not Aboriginal but did decide that he was "not satisfied on all the material before him that a particular applicant was Aboriginal" (Tasmania Department of Premier and Cabinet, 2008). The Assessor then chose to rely on Australian jurisprudence and legal definition to determine Aboriginality. This was the most common means of rejecting an applicant.

Complex forms and legalistic language

As is the case with communication about compensation processes (described above), the language within the application itself must be consistent and clear. For example, many Indian Residential School survivors believed that the process was overly **complicated and burdensome** and that information was conveyed in an inaccessible manner. One recurring challenge was the use of legalistic – rather than simple, clear – language to describe concepts and allow claimants to produce evidence. According to NCTR (2020), key technical, legal concepts including – "serious physical abuse," "wrongful acts, and "loss of income" – were not explained well because no examples were provided to illustrate what these concepts meant.

In the Day School Settlement Process, Ken Hudson, former Fort Smith Métis Council local president, stated that "everyone he knows is filling out the form for the lowest amount of compensation" because they do not understand the terms (Desmarais, 2020a). Belt strappings, for example, were a common method of physical abuse. Yet, the forms do not, in Hudson's opinion, explicitly explain how much compensation individuals are eligible for that form of abuse. Survivors ask, "can't they simplify [the application] to say 'did you get strapped?'" (Desmarais, 2020a). Some claimants therefore felt traumatized because they are short-changed on the amount of compensation they receive. For children, this issue is especially difficult because if they are required to complete forms to submit claims, they might not understand exactly what they are completing.

Interviews with ISC staff highlighted that streamlining applications to be less intensive for claimants (e.g., omitting maiden names/previous names from the application) and shorter in length (a few pages), as well as receiving feedback from multiple stakeholders regarding forms being sent out (e.g., representative class plaintiffs, victims, class counsel, and intervening parties) can lead to superior design and implementation. It is also more cost-effective, because it is less time- and labour-intensive to implement (in-depth interview with ISC staff).

Onerous burden of proof

Providing documentation to prove past harm, and therefore eligibility for compensation, can be onerous and sometimes impossible for claimants who are indeed eligible. This often relates to the **lack of documentation** within institutions related to the reason for compensation, rather than individual oversight or lack of trying. Importantly, residential school survivors found producing supporting documentation difficult and oftentimes onerous. Where survivors were asked to produce documents supporting their attendance using archival or evidentiary proof-of-attendance, they found that sourcing those documents "involved another difficult-to-navigate process with colonial institutions and departments" (Anglican Church of Canada, 2019, p. 6).

One conversation with staff at ISC suggested that onerous verification of documentation may ultimately **cost** more than just paying applicants with imperfect evidence because of the important financial and human resources required. Although it is important to verify applications to ensure that the compensation process is fair, it can often cost more to verify every single document to support a claim (in-depth interview, Indigenous Services Canada staff). As such, trusting claimants is an important and overarching value to implementing a successful compensation process.

Our interview with Donna Cona[2] staff highlighted that trauma was most often triggered in the Sixties Scoop settlement process in cases where claimants were eligible, but the government had no documentation of their adoption. This re-awoke feelings of abandonment, frustration that they had to go through the process, and – for some – contributed to suicidal ideation (in-depth interview with Donna Cona staff). According to Kathe Legrange, the Director of 60s Scoop Legacy, many survivors believed that Collectiva would be responsible for finding supporting documents on behalf of claimants. She said: "law firms initially told claimants that Montreal-based Collectiva would obtain their records," but now the "**onus is put on survivors**" to obtain documents to substantiate their claims (Martens, 2020). Further, because claimants are now required to produce documents to support their claim, lost records are more difficult to find and prove, often in **tight timeframes**. For example, Vanessa Desmeules, an applicant, was told that there was no record of her presence at the school. Records were complicated for Desmeules to obtain because her foster parents changed her last name, and her birth parents did not have a birth certificate. Desmeules was ultimately able to obtain old report cards, and get a birth certificate, all within the 45-day deadline (Forrester, 2019).

Strict timeframes and application process

Application processes with strict timeframes have limited the efficacy of claims processing, reduced access to compensation, and ostracized claimants. In the IAP, which imposed a tight deadline, many survivors felt emotionally ill-equipped to comply with the application timeframe. When they did apply, IAP hearings were often held in one day – which made hearings more about the adjudication process rather than the claimant, because claimants were expected to be expressive "on command" (Petoukhov, 2019, p. 104). If adjudicators were not satisfied or required additional documentation or evidence to reach a compensation decision, they could ask claimants to produce more information, thereby re-igniting and inflaming their trauma again (NCTR, 2020). Timeframes that suited adjudicators rather than claimants reduced participation in the process and increased survivors' feelings of ostracization. Deadlines were too short – especially because some survivors delayed applying for CEP and/or IAP because they feared retraumatization, leading many survivors to be "unjustly excluded from receiving compensation" (NCTR, 2020, p. 33).

In the Day School settlement process, some claimants, and their families, similarly felt that the process was "unfair and rushed" (Deer, 2020). Like the IRSSA process, there were strict deadlines and a limited 5-year process of eligibility. One claimant's daughter stated she believes that the process was made to be "as unfair or as hard as possible" with the intention of cutting "as many people out as possible" (Deer, 2020). Individuals suffering from serious emotional or physical trauma often take differing amounts of time to process their trauma and wish to "reveal more as they feel comfortable." Instead, this process required claimants to complete multiple applications, bear the burden of sourcing many documents, and comply with specific external deadlines (Deer, 2020). The notion of **progressive disclosure** – in which individuals disclose information over time rather than all at once – can support individual agency during the process and reduce the potential for retraumatization. A progressive disclosure approach would allow survivors to "reveal more as they become more comfortable" (Deer, 2020). This is particularly important for children who may also be more capable of sharing information over a period of time. Australian timelines were even shorter than Canada's processes, thereby leading to retraumatization and running counter to principles of progressive disclosure.

Our interview with ISC staff highlighted that, beyond the need to account for progressive disclosure, the **size of the claimant pool** had to guide the determination of the length of the settlement agreement. If Canada underestimates the time needed to receive claims, this can seriously impede the compensation process and retraumatize claimants.

Deloitte has prohibited claimants from **modifying their claims**, leading some survivors to receive less compensation than they deserve. For example, a classmate of Dorothy Dell, a claimant, was sexually assaulted by a clergy member off school property, but because the assault occurred off-campus, she was only told to file a level one claim (the lowest level). Subsequently, she heard that one of her classmates was able to file a claim at a higher level for similar conduct. She sought to modify her claim but was told that the "check was already mailed" (Deer, 2020). This subverts the goals of recognizing harm and can lead survivors to relive and relitigate their abuse without full and fair compensation for the type of abuse suffered.

2 Donna Cona is an Indigenous-led, private consulting firm that provides mental wellness and support services. Among other services, they ran the Indian Residential Schools Settlement Agreement contact centre, and operate the ongoing IRS Crisis Line and the Hope for Wellness Helpline.

Narrow interpretation of eligibility

Eligibility for some settlements in the past has been seen as unfairly excluding individuals due to **narrow interpretation** of the reason for compensation. Claimants – and ineligible members of communities – believed that excluding day school attendees from the IRSSA was unfair. The settlement agreement also excluded boarding schools, Métis schools, and some residential schools in the far north and Labrador. Participants believed the mandate and implementation of the IRSSA would be flexible, and that the settlement would be expanded to "include many if not all of those excluded in the original mandate." That flexibility did not occur, leading to an exclusionary "shadow that hung over the process" (NCTR, 2020, p. 21).

According to the United Church of Canada, some focus group participants emphasized that the exclusion of certain groups, namely day scholars at residential schools, "taint[ed] healing" and was a source of "great pain" (Anglican Church of Canada, 2019, p. 6). Dissension in communities grew as recipients of CEP felt **guilt** for receiving compensation when many friends, family, and relatives did not. Imprecision in defining and including all of the relevant schools and groups in the CEP and IAP process ran counter to the purpose of the IRSSA by making many survivors feel excluded from a process intended to repair and heal.

In the Federal Day School settlement process, some survivors have criticized how schools were selected for inclusion in the Day School program: namely, the exclusion of religious and provincial schools, as well as those managed by First Nations. For some, this meant that even though they were forced to attend settler-operated institutions, they could not participate in compensation. While individual legal remedies are still available, they have burdensome costs without a settlement or class action process available (Banning, 2019). In the Sixties Scoop Settlement, the exclusion of Métis claimants from the eligibility requirements has also been criticized (The Canadian Press, 2018).

Inflexible and narrow eligibility criteria in the Australian settlement processes was similarly criticized for being exclusionary. For example, the eligibility criteria in South Australia included children who were pressured to put their children up for adoption but excluded those who were removed by "purely private arrangements" (p. 15) – where a parent placed their child with other family members or institutions voluntarily (Government of South Australia, 2018). According to the Independent Assessor, "in most adoption cases my recommendations were that offers not be made" (Government of South Australia, 2018, p. 15). This means that – by design – individuals who might have been functionally forced to put their children up for adoption, did not have any recourse or compensation. Originally, children who were removed with a court order because of reasons of abuse or neglect were also excluded from the compensation process in South Australia. This criterion was eventually removed by the Minister for Aboriginal Affairs and Reconciliation after the assessor recognized that this would amount to a "cruel denial of their identity as Stolen Generation and would be tantamount to another 'removal' by government" (Government of South Australia, 2018, p. 16).

In Israel, a benefit intended for Holocaust survivors excludes those who moved to Israel after 1953 because the agreement between Germany and Israel was signed in 1952 (Chernick, 2019). As a result, "[t]here have been situations where brothers and sisters moved to Israel, but one came before 1953 and another after 1953, and they were in the same place, the same camp or ghetto – but they cannot [all] receive the monthly stipend because they came at different times" (Chernick, 2019).

Opaque adjudication process

Adjudication of eligibility of submitted claims has been unclear in several compensation regimes. For example, the focus of IAP was to measure physical and sexual abuse to make compensation determinations. Sexual and physical abuse was heavily favoured as a legitimate narrative of victimization, whereas other forms of abuse were diminished (Anglican Church of Canada, 2019). One survivor explained how they were bullied because they no longer spoke their community's language after returning from the residential school. Yet, despite this trauma and ostracization, the IAP process was not designed to compensate victims of this type of abuse. Therefore, they received none (Anglican Church of Canada, 2019). Similarly, one claimant was limited to speaking only about their sexual abuse and felt that most of their other experiences were "brushed off," (p. 30) despite being bullied and emotionally abused. Some survivors believed that the loss of language and culture was "equally traumatic" to sexual and physical abuse. By focusing on physical and sexual abuse primarily, IAP's compensation framework was incomplete and needlessly formulaic (NCTR, 2020).

In all of Australia's reviewed compensation schemes, the independent assessor had broad **discretion**, and the only oversight mechanism was the Minister

responsible for implementing the agreement. Claimants had no ability to appeal or reconsider claims.[3] Through this broad discretion, South Australian assessor John Hill decided, in consultation with individuals and groups advocating for the Stolen Generation, that gauging the level of harm would "in itself be harmful to applicants" (Government of South Australia, 2018, p. 14). Therefore, rather than compensating claimants at variable levels, he decided to provide a singular, lump-sum payment of $20,000 AUD. Reactions to this decision were mixed. On the one hand, Hill clearly grappled with how to minimize retraumatizing applicants. On the other hand, some claimants felt that the total amount of money allocated was too small already, and this made many claims even smaller (Government of South Australia, 2018). However, the lack of transparency and clarity regarding how this would be decided muddled the process.

Supporting claimants throughout their application

Levels of support provided to claimants in the settlements reviewed in this report are summarized in Table 3.3 on p. 109 More information regarding the application processes can be found in Appendix EE.

Inadequate legal support

While the complexity of some compensation processes requires individuals to seek legal counsel, the prospect of compensation can create the risk for **poor legal advising** and financial exploitation. For example, to navigate the burdensome IAP process, most claimants were encouraged to hire lawyers. This created numerous problems. Many claimants felt that their legal representation was inadequate (NCTR, 2020). Preparation was sparse; many survivors highlighted how they received advice "the morning of a hearing" on how to testify (NCTR, 2020, p. 40). Lawyers lost their files, required clients to do research for them, and some lawyers suggested that the claimants lied. Given that survivors were generally unfamiliar with Western legal systems, felt overwhelmed by the use of legal jargon, and were already nervous to share a traumatic experience in a skeptical environment, lack of preparedness exacerbated their discomfort and likelihood of success. Furthermore, lawyers offered translation services that were not cognizant of dialects, making some survivors feel like their claims were not heard at all (NCTR, 2020).

Legal fees were not fully covered by the settlement agreement and widespread **fraud and misrepresentation** by lawyers occurred. Some examples of misconduct include the following:

- In Saskatchewan, some lawyers required claimants to sign "blank forms with their information, in order to authorize fees being charged unfairly" (NCTR, 2020, p. 40).
- Calgary lawyer David Blott, who represented close to 6,000 survivors through the IAP process, was disbarred after he made "high interest loans" against their settlement payment – a practice explicitly forbidden by the settlement agreement and federal law. Further, many of Blott's clients were denied compensation because their written statements and oral testimony were inconsistent (Grant, 2019).
- Stephen Bronstein employed Ivan Johnny, a convicted murderer, to sign up IAP clients. Johnny threatened claimants with threats of bodily harm and allegedly stole IAP compensation from survivors. Johnny's parole was ultimately revoked (Martens, 2013).
- Ken Carroll, a Winnipeg lawyer, allegedly accompanied survivors to the bank and then subsequently demanded excess payment for legal services that he was already compensated for from the settlement agreement (Global News, 2014).
- Kenora-based lawyer, Doug Keshen, was accused of exploiting survivors by failing to pay them their full settlements within a reasonable amount of time and transferring settlement funds for clients from his trust account to his general account. Keshen categorically denied wrongdoing, and a settlement was reached that led to increased oversight of his practice (Robinson, 2017). The Law Society received extensive criticism from Indigenous groups about how they interacted with Indigenous peoples (Prokopchuk, 2019).
- One Survivor discussed how she was "hounded by the same law firm" until she proceeded with her claim (NCTR, 2020, p. 41).

All of these challenges, and the confusing legal compensation structures, led survivors to feel as though nobody was advocating for them. Many felt alone.

3 By contrast, in Canada, all compensation schemes investigated incorporated an Exceptions Committee oversight mechanism and had a multi-step reconsideration process.

Table 3.3 Support provided to claimants in Canadian and International compensation regimes

Compensation regime	Access to free legal assistance for claimants	Availability of assistance for form completion	Healing supports
Common Experience Payment (IRSSA)	Provided free of charge.	Toll-free telephone number to answer application questions. Provided inconsistently.	Toll-free telephone number also provided mental health and emotional support services.
Independent Assessment Process (IRSSA)	Claimants were advised to hire lawyers, at their own cost, to navigate the complexity of the process.	Sometimes provided, but generally inadequate. Claimants regarded "form-fillers" as too young and withheld information about their abuse.	Available, but criticized by claimants for inaccessibility.
Sixties Scoop	Available and provided by class counsel.	Provided by claims administrator.	Available. Crisis line and trauma-informed training.
Federal Day School	Available and provided by class counsel.	Provided via claims administrator and legal counsel; regarded as inadequate.	Available. Crisis line and trauma-informed training.
Motherisk	Available. Included legal counsel case reviews and referrals to legal counsel.	Not relevant.	Available, and extended to include more applicants
Tasmania (Australia)	Not provided.	No; however, if the assessor believed that the application would not succeed, they were given the opportunity to informally meet with the assessor.	Yes – counselling was available.
New South Wales, South Australia	Applicants in NSW were directed to contact legal aid provider, but assistance was not provided explicitly. South Australian applicants received $1000 AUD for legal advice if they received an offer for compensation.	Yes.	New South Wales and South Australia compensation scheme included a healing fund.

Consequently, the recognition promised by compensating survivors through the IAP process was incomplete and fell short of the settlement agreement's goal of providing closure to claimants. The adequacy of some of the services provided to claimants has been questioned. For example, multiple survivors filed complaints against one class counsel for failing their clients and letting claims "languish for years" (Barrera, 2018).

In another example, in the early 2010s, a scheme was uncovered that embezzled over $57 million USD from the Holocaust survivors' Claims Conference. Federal prosecutors prosecuted and secured convictions for 31 individuals who recruited individuals who did not qualify for compensation, processed the claims, and disbursed funds to the recruiters (Federal Bureau of Investigation, 2010; United States Department of Justice, 2013). There were over 3,000 applications. Consequently, a 2014 internal review of the Claims Conference suggested shifting the emphasis of compensation from recompensating Holocaust survivors to honouring and remembering their losses to prevent future genocide (Heilman, 2014).

Lack of impartiality

The process of disclosure during hearings and appeals processes in past settlements has led to feelings of being **misunderstood and questioned**. Claimants bore the burden of telling and proving their story of physical, sexual, and emotional trauma during the IAP process. However, their retelling often fell on skeptical ears. Adjudicators, lawyers, and judges met disclosure with doubt. Questioning was "particularly intimidating" for survivors. Many felt that

hearings were "very intrusive," "unfair," and left feeling like their "integrity was being questioned" (Anglican Church of Canada, 2019, p. 7). The prospect of repeated explanations of stories created additional concerns for survivors. There were approximately 38,000 survivors who participated in IAP, whereas only 7,000 TRC statements were collected. Survivors who wished to participate in both had to tell their stories multiple times. Given the emotional and vicarious trauma suffered by communities, understandably, they did not want to relive their trauma repeatedly (NCTR, 2020).

Many survivors also believed there was an appearance of bias that reduced the impartiality of the process. The IAP process was designed to be independent of the CEP – which Canada was responsible for managing. Instead, the IAP process "functioned as a sector" (p. 33) within Indigenous and Northern Affairs Canada (now ISC), which provided security, procurement resources, and hired adjudicators (NCTR, 2020). This **appearance of bias** reduced survivors' trust in the process and distorted reconciliation and the recognition of harm.

Inadequate mental health support

Another problem has been the inadequate access and availability of mental health support for claimants. For example, during the IRSSA process, some claimants complained that despite lawyers' obligation to inform survivors of the availability of mental health supports, they often **did not inform claimants** until immediately before IAP hearings. IAP events were neither "advertised well in advance" nor advertised "in modalities that will reach even remote communities" (NCTR, 2020, p. 63).

After claimants returned from IAP hearings they – understandably – felt trauma, but the mental health supports were neither accessible nor trauma informed (NCTR, 2020). Rather than supplying access to consistent, in-person resources, the Agreement made mostly web-based or telephone-based supports more available (NCTR, 2020). Further, the supports that were available were often **Western-centric** instead of community-driven systems. Other issues with mental health provision during the IRSSA included the fact that Indigenous therapists were excluded from a list of approved therapy options for survivors, and that rotational therapist programs, especially in the North, required survivors to recount their stories repeatedly, and often these therapists were more concerned with payment than adequacy of service (NCTR, 2020).

Our interview with Donna Cona staff, who provide supports with the Sixties Scoop and Day School processes, highlighted that the use of **different modalities** for the provision of mental health and other supports was important when working with claimants of different ages. For instance, they noticed that children or younger adults sometimes preferred using the chat option when talking to staff because it meant that they could reach out from a computer or a phone, without people around them knowing what they were doing, which heightened their sense of privacy.

Inadequate administrative support

Inadequate support for the application itself, including responding to questions and providing updates on application status, has revealed ways in which this could be improved. For example, one conversation with ISC staff highlighted key points regarding support for claimants during the IRSSA process. Claimants care deeply about protecting their very **private information** – especially related to abuse. For example, Canada decided to hire "form fillers," typically younger individuals from the community hired to assist applicants with completing applications. This made many claimants uncomfortable. Because of their youth, form fillers tended to be younger adults from the same community, and claimants did not wish to share their intimate personal details (namely, their sexual and physical abuse) with these individuals. This impeded the process because it led to surprises at IAP hearings – since the claimants disclosed far more information than initially disclosed in the application. Consequently, more documentary evidence was required, and the categorization of compensation needed to evolve. Some solutions include negotiating clear text in the settlement agreement on how privacy will be protected and providing the implementing parties with greater flexibility to protect privacy (in-depth interview with ISC staff).

Hiring **community liaison officers** led to more successful application processing. Community Liaison Officers worked closely with claimants, and frequently contacted ISC to resolve ambiguities and issues. Although this program required a high upfront investment, applicants who worked with community liaison officers received high first-time approval rates of applications. This process also helped identify other forms of acceptable government-issued identification (namely, hunting licenses) that ensured more eligible claimants could apply and increased the efficiency of application processing (in-depth interview with ISC staff). Ultimately, it was very successful in saving time and money.

Table 3.4 Claims processing mechanisms in Canadian and International compensation regimes

Compensation regime	Claims Administrator	Algorithmic review	Hearings	Appeals
Common Experience Payment (IRSSA)	Office Indian Residential Schools Canada	Yes, Canada deployed an algorithmic search engine to review applications (CARS and SADRE).	Not available.	Yes
Independent Assessment Process (IRSSA)	Office of Indian Residential Schools Canada	No	Required. Extensive hearings process with an independent adjudicator, claimant, and counsel (although the claimant had to pay for counsel's legal fees).	Yes
Sixties Scoop	Collectiva	No	Not available.	Yes
Federal Day School	Deloitte	No	Not available.	Yes
Motherisk	N/A	N/A	N/A	N/A
Tasmania (Australia)	Single independent assessor	No	Claimants met with the independent assessor informally if he felt the criteria was not met.	Limited reconsideration was available by the Assessor via an interview with the claimant. However, there is no judicial/ independent review. The Minister overseeing the Assessor had the discretion to approve of applications.
New South Wales and South Australia	Single independent assessor	No	Required, but no formal legal processes.	Same as Tasmania.
New Zealand Oranga Tamiriki (Waitangi Tribunal)	Waitangi Tribunal	No	Required.	Not applicable – since the Tribunal mostly provides recommendations, appeals are not required.
Holocaust Reparations	Claims Conference	No	Not required.	Available.

Key lessons learned – Applying for compensation

Challenges. Applications can be confusing for claimants because of their legalistic language and application processes. Tight timelines, lacklustre (sometimes fraudulent) legal assistance, and untrained emotional support personnel can mean the process is cumbersome at best and retraumatizing at worst.

Opportunities. The application design must be inclusive, using culturally appropriate, easy-to-understand language. Some key takeaways regarding the application process include:

- **Consider participatory, Indigenous-led design of application processes.** Centring and being more attentive to Indigenous legal paradigms and community supports can more faithfully advance reparative justice initiatives. Western legal systems should not be all-encompassing. Indigenous legal traditions should be incorporated explicitly, or entirely, in providing legal remedies. Spatial and temporal restrictions on eligibility that comport with exclusively Western legal ideas should be minimized wherever possible.
- **Less complexity may alleviate the process and cost for both claimants and administrators.** The more arduous, legalistic, and complicated the process the more difficult it is to implement. Easier processes with straightforward forms and minimal burden of proof could reduce potential retraumatization through alleviation of the process and increasing access to compensation for eligible individuals. The application process should optimize flexibility and transparency to simplify and clarify the process for the administrator.

- **Provision of adequate legal support.** Understanding literacy rates in the community, conferring with community leaders to determine the types of supports preferred, and having a flexible review process will improve compensation processes. Legal counsel should be free-of-charge to claimants. If a process similar to IAP or CEP is chosen in which lawyers are recommended, the Court should appoint an overseer and provide a list of preferred vendors.
- **Sufficient mental health supports should be available and informed by the needs of the claimant population.** A toll-free helpline is a start but may not be sufficient to support the mental health needs of many individuals and communities affected by the compensation process. Indigenous community supports should be available, in addition to in-person mental health resources and counselling.
- **Provide sufficient resources to administer processes effectively.** Hiring an adequate number of trained staff to assist claimants in a community-centric manner is essential to an effective implementation of a compensation regime. Resources must be available in languages that claimants speak, not just in English and French. Different communities should receive different targeting and have different resources available to support the application process.

Processing of claims

Overview

The processing of applications in past compensation schemes demonstrate some logistical, managerial, and technical learning that can be applied to the design of future processes. Planning ahead to receive applications can alleviate a number of problems once the application period opens. Transparent communication about the process can help manage expectations of claimants related to the application and processing times. Consideration of resources needed to manage a high volume of applications and inquiries, what sources of information will contribute to claims processing, and which tools will be used are all relevant for application processing.

The process of receiving and managing applications for compensation in the compensatory regimes we reviewed are summarized in Table 3.4 on p. 111. More detailed information regarding processing of applications is found in Appendix EE.

Lessons learned

Insufficient preparation for application process

Past settlement processes clearly demonstrate that planning ahead for receiving applications could reduce potential problems once applications are received. For example, the volume of applications for the CEP and IAP was higher than the Government of Canada anticipated. The deluge of applications meant that Canada did not have the resources needed to process applications. One important lesson was that **providing a buffer between the implementation of the agreement and the court order** is required to ensure implementation is smooth. By creating a "buffer" the implementing party can hire the appropriate number of staff, identify and potentially resolve definitional ambiguities, set appropriate expectations with claimants, and train staff to deal with traumatized communities (in-depth interview with Indigenous Services Canada staff). The importance of putting a lot of effort into planning and structuring before centralizing out was also brought forth in our interviews with Donna Cona staff, who provide support with the Sixties Scoop and Day School settlement processes.

Lack of resources to successfully identify and assist claimants

The absence of **sufficient resources available to agencies** that are supporting the identification of claimants can significantly slow down the processing of applications. For example, our interview with a member of the Motherisk Commission highlighted that the lack of records at the Hospital for Sick Children slowed down the identification of claimants. This led to inconsistent processing as child welfare agencies needed to be involved in identifying claimants: agencies in large geographical areas had more resources and people to process cases, while smaller child welfare agencies had limited human and financial resources, which made it more challenging for them to review dense, often paper-based files, to source applicants and copy the files the Motherisk Commission needed. Often these were Indigenous agencies located in Northern Ontario. Consequently, the Ontario Government, according to a member of the Motherisk Commission, invested $500,000 CDN to source applications and provide provincial resources to hire more staff to assist in the review process. This enabled the Motherisk Commission to receive significantly higher response rates and review many more applications expeditiously (in-depth interview with a member of the Motherisk Commission). The Ministry of Child Services had also issued a directive asking all Children's Aid Societies to produce documentation supporting the claim, which

in concert with the resources allocated, led to a high volume of identification and ensured the Commission felt like they had access to many, if not all, of the documentation they needed (in-depth interview with a member of the Motherisk Commission). If appropriate resources are not deployed for staffing and responding to emails or other modes of technological communication, it can frustrate both claimants and the agencies trying to support them.

Delays in processing times

Delays in processing applications have arisen in past compensation schemes and muddled the process for both claimants and the government. The experiences of the Day School settlement are one example where inconsistent processing times caused conflict and confusion among claimants. For example, Norman Yakeleya, the Chief of the Northwest Territories Dene Nation, highlighted how he heard that siblings filed claims on the same day, yet one sibling received their claim and the other did not (Desmarais, 2020b). No explanation was offered by Deloitte for the difference in processing times. This led to tension between families and the community. Delays – according to the government – are born from the partial burden on the Federal Government Crown-Indigenous relations to provide documentation to prove the claim (Desmarais, 2020b). However, First Nations and Indigenous survivors paint a different picture. They argue that the Government and Deloitte were not communicating effectively with one another, leading to claimants who filed claims at approximately the same time to receive decisions at different times (Desmarais, 2020b).

In the Sixties Scoop settlement, survivors also experienced important delays. As of June 2020, not a single claimant had received any compensation, despite the settlement agreement being finalized in December, 2018, and a settlement agreement in principle being reached in October, 2017. The Court intervened in 2020, amid COVID-19, ordering that cheques be paid out to claimants (Collectiva Class Action Services, 2020). According to Argyle PR, the pandemic and the burden of proof led to slower claims processing for some applicants (Hyslop, 2021). For example, one claimant submitted her application in August 2018. By January 2021, she had still not received a decision on her application, despite countless emails and phone calls. No one has been able to tell her whether her application was accepted or rejected (Hyslop, 2021). She is not alone either – as thousands of applicants wait for years after initially filing, with their questions largely unanswered. The harm caused by delays has been compounded by a lack of communication. For example, Shannon Bernard, an applicant who lives in Toronto, emailed to ask for a status update on her claim. She received three calls back, all of which asked for basic information. At the time of a media interview, Bernard had heard nothing about her application despite providing them with the basic information multiple times (Deer, 2020). This lack of communication makes claimants feel unrecognized. Public outcry about the inability of the claims administrator – Collectiva – to respond to applicants led to judicial intervention in May 2020, appointing Donna Cona, Inc., to operate a call centre, maintain a database of eligible claimants, and provide personnel to perform these duties (*Brown v. The Attorney General of Canada*, 2020).

Unavailable records and data

It is important for claims administrators to be aware of jurisdiction-specific record destruction (or "expungement") policies and practices. In the interest of data confidentiality, many jurisdictions impose conditions or timeframes that dictate how long or why a record may be saved. (Please see section II of this report for a high-level summary of data expungement practices in Canadian jurisdictions.) While these practices nominally aim to protect information about individuals, historical destruction of records can have significant implications for individual claimants seeking compensation. In Saskatchewan, for example, the Government destroyed some of the records substantiating claims that Sixties Scoop claimants were adopted. Specifically, the Ministry of Social Services received approximately 2,000 claims requesting information proving their adoption and were able to satisfy 84 percent of those claims (James, 2020). However, it has led to asymmetrical outcomes between family members, where some siblings are able to prove their adoption and receive compensation while others are not.

Difficulty in paying individuals

Our interview with ISC staff highlighted unexpected payment issues during the IRSSA compensation process. Many claimants, especially youth, did not **have bank accounts** and electronic payments were not set up immediately. To improve the process, it was recommended to set up bank accounts early.

Another unexpected issue that arose during the IRSSA process was the presence of "**lost claimants**," i.e., individuals who had applied for CEP or IAP payment, then "disappeared" – meaning the claimant could not be located by the Government to receive their check or proceed with the next phase of the application process. The search for certain lost claimants who filed

applications in early 2010 still continues to this day. Locating lost claimants has been costly, requiring the services of private investigators. Further, communicating with claimants using their preferred mode of communication was important to resolving issues – some communities responded immediately to text messages while others were more comfortable using other modes of communication (e.g., phones, mail, etc.).

Issues with full automation of decision making

The use of technology has great potential to speed up the processing of applications but should be approached with caution. While the capacity to scale application processing is greatly increased with automated decision making, this is only possible, accurate, and fair when robust data are available and accessible. The IRSSA process using application processing software demonstrates tangible lessons regarding automated decision making for compensation. The CEP in IRSSA relied on multiple software programs (SADRE, CARS) to receive and process applications. These programs contributed to about 44 percent of the compensation decisions made – cases for which the data was clearly available and complete. However, these programs were subject to several challenges that caused delays and disruptions to the compensation process.

SADRE and CARS were launched quickly with the implementation of the settlement process, without the time to test for bugs. First, the programs were not designed to respond to the volume of applications that the CEP process generated in the first three months. Almost 80 percent of the 105,000 applications were submitted during the first three months. Consequently, the delivery of cheques was delayed because the IT systems lacked the capacity to "handle the vast amount of information that had to be collected and processed" (Aboriginal Affairs and Northern Development Canada, 2015, p. 38). Second, CARS had structural, design flaws. It could not identify gaps of time in student claims. The dataset also only consisted of a limited number of years, and therefore the algorithm could not accommodate the unanticipatedly high number of applicants early in the process (Aboriginal Affairs and Northern Development Canada, 2015). Third, to add to these volume-related issues, CARS was unintegrated with SADRE and other CEP Information Technology systems. This meant that information across systems and across the departments responsible for validating and assessing claims was unshareable. Consequently, CARS was "slower, less productive and effective" than suspected (Aboriginal Affairs and Northern Development Canada, 2015, p. 44). The Government of Canada believes these issues were not as costly because of the dedication of employees in meeting goals – meaning manual follow-up was ultimately needed in the end. Additional information on the CARS and SADRE system are available in Appendix EE. The following text box provides an overview of some of the main lessons learned from this process.

The example of IRSSA application processing software: SADRE and CARS – Key lessons learned

Although many years have passed since the SADRE and CARS systems were deployed, this experience provides multiple lessons for how effective implementation of a claims process can be implemented:

1. Test early, and test often: Test the algorithm early, often, and plan for contingencies.
2. Plan for the worst: Ensure the system can handle an early surge in applications and invest in appropriate IT infrastructure to handle a larger-than-expected number of applications.
3. Use consistent systems: Where possible, use a single IT platform created for and developed by a single governmental entity.
4. Develop consistent review policies and share best practices: Where two offices are deploying technological tools, with differing levels of trust, ensure consistency between offices in implementing the technology. This can diminish the asymmetry of retraumatization if there are delays.
5. Set reasonable expectations about the utility of technology for claimants and the government: Class action implementation in Canada has been imperfect and there have been repeated examples of long delays in processing applications. Technology is fallible. Therefore, it is essential to set expectations with claimants on the length of time it will take to process applications and explain that delays are, unfortunately, inevitable. However, it is also essential for practitioners – namely government contractors and internal stakeholders – to ensure they set reasonable timelines and have a clear-cut understanding of how the technological systems will function.
6. Training Matters: Training service providers to deal with intercultural issues, trauma, and language barriers can improve compensation processes.

Key lessons learned – Processing claims

Challenges. Application processing has suffered from capacity and technological issues. Underestimates of applications has led to governments becoming understaffed and overwhelmed – leading to unanswered calls, slow processing times, and inconsistency. Second, high application numbers have meant that the algorithmic tools designed to expedite processing have fallen short.

Opportunities. Some key takeaways regarding the processing of applications include:

- **Prepare to receive applications.** To optimize the efficacy of application processing, there should be time between the official legal compensation agreement being finalized and the actual launch of the application process.
- **Clearly communicate to manage internal and external expectations.** Given repeated examples of long delays in processing applications, it is essential to set expectations with claimants on the length of time it will take to process applications. Government contractors and internal stakeholders must also set reasonable timelines and have a clear-cut understanding of how the application process will function to ensure consistency in communication with claimants and administrative staff.
- **Be cognizant of availability and accessibility of data.** The extent to which information supportive to claims is available and accessible can be highly variable.
- **Use of technology.** If an algorithm is used to process claims, it should be tested early and often, and contingencies should be made to handle an early surge in applications once the application is live. Online application platforms should be developed consistently across the country, and training on these platforms should be uniform to ensure consistency in decision-making and to support trust and transparency in the process. Technology is a useful tool, and it can lead to more efficacious and efficient processing of compensation. However, it is no panacea for ensuring quick processing of blanket compensation payments, especially in the face of inconsistently available data.

Conclusion

Reflection on past Canadian and international compensation settlements and reparations schemes can provide useful considerations for future compensation processes. While settlement schemes can raise awareness about past harms to Indigenous communities, provide formal recognition of damages, and improve the material condition of claimants, past settlements have often fallen short of their ameliorative goals due to operational oversight. Repeatedly, individuals have been retraumatized by slow and burdensome processes that can have the opposite impact of the intended remediation they are designed to produce. The burden of proof is often too high – and placed mostly on claimants. Technological tools can assist claims but can marginalize and retraumatize those whose cases are more complex and less well documented than others. Inadequate resources and training to claims administrators can further subvert healing and undermine the intended reconciliatory aims of a settler colonial government providing compensation.

Some of the important takeaways related to the lessons we identified are as follows:

1. **Communicate with claimants on their terms.** Calls and public affairs campaigns to encourage applicants must be attentive to the target Indigenous population. Broad-based communications – while effective at reaching a large audience – are inadequate at reaching certain populations who live in communities that do not use that mode of communication.
2. **Centre inclusion – both in design and implementation.** The process of applying for compensation retraumatizes many victims – even if the system is designed perfectly. Retraumatization is repeated in virtually all compensatory frameworks. Longer timelines, more resources to support application processes, and reducing the burden of proof on claimants is necessary to create an inclusive process.
3. **Devote more (or sufficient) resources to claims processing.** Claims administrators – in Canada – have repeatedly disappointed claimants. Phones go unanswered, processes are confusing, and processing timelines take too long. Future payments schemes must deploy adequate resources to process claims, provide information in a manner that is attentive and designed to meet the needs of claimants, and processes claims in a consistent and timely manner.

Working with children in legal contexts

When children interact with the justice system – as witnesses, complainants, or offenders – it is essential that they are met by a system that understands their rights and unique vulnerabilities. (CRIN, n.d.). Unfortunately, Canada's justice system can be "mechanistic, "and is often governed by its own "agenda" – meaning that children's interactions with the justice system are imperfect, at best, or re-traumatizing, at worse. (Office of the Federal Ombudsman, 2017). Although numerous child-friendly legal frameworks exist, and have slightly different emphases, they ultimately share similar core principles. A child-friendly legal system ensures children are treated with dignity, respect, care and fairness. It provides access to justice, efficiently and equitably by empowering children to be heard and ensures that legal system account for their unique needs. (Council of Europe, 2010). Working with children in legal contexts ought to be less system-centric and more "person-centric." (Office of the Federal Ombudsman, 2017) Below, we outline some considerations for working with children in legal contexts:

Protect access to justice and inform children of their rights to ensure effective participation. Children and their parents must know and understand what their rights are in legal or quasi-legal proceedings. Specifically, children and their parents must be "promptly and adequately" informed about relevant procedures, rights, remedies, support mechanisms, and the time and place of judicial or quasi-judicial proceedings (CRIN, n.d.; Council of Europe, 2010). Legal professionals should provide information to ensure effective participation by children by not underestimating children, building trust, and understanding and advocating for a child's perspective on an issue after ensuring they have the information they need to formulate an opinion on a matter. (UNICEF ECARO, 2018).

Ensure legal agents act in the best interests of the child. All legal advice and services must be provided in a way that is for the best interests of the child. (UNICEF ECARO, 2018; CRIN, 2017). This means that legal professionals must have a robust understanding of children's rights, interacting with key members of the legal system (e.g., judges and police officers), and how to tailor strategies to most effectively meet the child's legal needs. (Council of Europe, 2010; UNICEF ECARO, 2018).

Provide legal information in an age and culturally appropriate manner. Any materials provided to children must be child friendly. Age, gender, language, maturity must be considered when providing materials about legal proceedings to children so that they can have an appropriate understanding of what is occurring and can make decisions, with appropriate adult consultation, regarding the means of reparation, defense, or other elements relevant to making decisions. (UNICEF ECARO,2018; Council of Europe, 2010).

Protect safety and mitigate harm for children in frightening situations. Children must be protected from harm (CRIN, n.d.). Harm includes physical or non-verbal intimidation, reprisal for participation in the justice system, and any other form of secondary victimization. Consequently, and to prevent stigmatization of the justice system, lawyers and legal actors must take efforts to ensure children's safety by reducing harm. Lawyers can demand that a child have a separate waiting room (especially if they are testifying or involved in proceedings against a parent or guardian) and should be allowed to participate remotely (where acceptable) (Council of Europe, 2010).

Ensure competence of the legal system to adequately protect children. Individuals who work with children must be competent. All professionals who work with children must be trained in how to communicate with children and receive "interdisciplinary" training (Council of Europe, 2018). This means that judges, lawyers, and other legal professionals receive ongoing training on how to interact with children, have a basic understanding of children's cognitive, physical, and emotional development (Council of Europe, 2018). These professionals must know that they can, and how to, receive specialized advice from psychologists, social workers and other trained professionals (UNICEF ECARO, 2018).

Protect Children's Privacy. Children can be victimized and experience extreme emotional and potentially physical harm if their privacy is not protected, and if they are accused of criminal offenses, they can be ostracized or discriminated against if their identity is disclosed (UNICEF ECARO, 2018). Children's proceedings should there be conducted privately (unless there is a compelling justification for it to be conducted in public) (UNICEF ECARO, 2018). Further, criminal records should not be disclosed until the child reaches the age of majority, and judges and the media should omit children's identities from their reasons for judgment and reporting (UNICEF ECARO, 2018). Explaining that different rules and procedures must be followed for cases where children are implicated is also essential to preserving confidentiality and child protection.

A Closer Look at Retraumatization

Eden Haber and the CHRT Compensation Project Research Team

Summary: Key risk and protective factors for retraumatization in settlement, compensation, and justice-seeking processes

Factors that contribute to the risk of retraumatization:

- Requiring disclosure of traumatic experiences on multiple occasions
- Scaling compensation based on the established severity of abuses
- Adversarial approaches
- Procedural formalism and restrictions on the way in which a survivor tells their story
- Lengthy waiting periods
- Existing vulnerability related to racialization, marginalization, and lack of resources

Factors that protect against retraumatization:

- Adopting culturally relevant approaches to compensation and justice that may differ from Western legalistic traditions
- Availability of trauma-informed, culturally-sensitive support services before, during, and after, for participants and their families and communities
- Preparation for participation including explanation of procedures, timeline, requirements of participation, and possible costs/benefits of taking part
- Training all personnel involved in administration and adjudication in trauma- and cultural-sensitivity
- Considering compensation and justice at the individual, family and community levels, and attending to cultural and structural factors that created conditions for abuse

Introduction

Experiencing harm or a violation of an individual's relational or physical safety can lead to a trauma response. Trauma can manifest as a variety of physical, emotional, psychological, and cognitive symptoms. Reminders of events or experiences that caused a traumatic response in the past may become a trigger, causing these or similar symptoms to re-emerge. Justice-seeking processes such as legal settlements and compensation can function as such a trigger, particularly when the source of potential remediation is also the source of the past harm. While individuals have unique past experiences and trauma responses, there are a number of ways in which the potential for retraumatization can be exacerbated or alleviated. This report, based on a review of social science literature, explores the notion of retraumatization through an experiential lens. It is meant to complement the findings of the review of past settlements (see **Exploring lessons learned from Canadian and International approaches to compensation agreements** on p. 97) that summarized operational lessons learned in previous compensation processes, by providing a deeper understanding of the psychological processes. It is our intention that this review – in tandem with the previous section – can serve as a reference document in designing compensation procedures that consider the experiences of individual claimants and minimize the potential for retraumatization.

Theoretical understanding of retraumatization

Defining trauma and traumatic stress

Trauma is the enduring physiological and psychological response to a distressing event (van der Kolk, 2018). **A traumatic response**[4] occurs when an individual's ability to comprehend and process certain events is overwhelmed (Psychotherapy, 2018). This induces a shift in worldview, such that the individual begins to experience the world as being fundamentally unsafe. The individual then enters a state of chronic hyperarousal and hypersensitivity to threats to their safety, and the threshold to enter a "danger response mode" decreases, which creates heightened stress. Although traumatic stress is often discussed in the context of Post-Traumatic Stress Disorder (PTSD), this diagnosis is just one of a variety of "clinically recognizable responses to trauma," which can include emotional, psychological and physical symptoms

4 Similar events may be experienced as traumatizing for some and not for others.

related to fear, anxiety, memory and more (Kirmayer, Lemelson, & Barad, 2007, p. 1). Furthermore, trauma may occur as the result of a **single event**, such as a sexual assault or natural disaster, or of **multiple or ongoing events** or chronic conditions that have a developmentally adverse impact, as is often the case in childhood trauma (van der Kolk, 2007).

Defining retraumatization

Trauma produces enduring changes in the way one interfaces with and experiences the world. Because of these changes, adverse events that follow a traumatic event do not have a simple additive effect. "Rather, each sequential event is understood as...another stone tossed into an already disturbed stream" (Kudler, 2012, p. 51). Once an individual or community has experienced a trauma, they may develop an increased vulnerability to reinjury. Like a physical trauma or "a wound that has not quite healed," subsequent stressors can exacerbate or reinitiate the pain of the initial injury, even if they do not parallel the initial event in nature or intensity (Substance Abuse and Mental Health Services Administration, 2017, p. 3). This reopening or aggravation of trauma symptoms is known as retraumatization (Dallam, 2010).

As described above, trauma can lead to a state of hyperarousal and hypersensitivity. When individuals encounter reminders of their original trauma or "triggers" (described in additional detail below), they may experience bodily and psychological sensations similar to those experienced at the time of the original trauma (Dallam, 2010). Individuals having a **retraumatization response** may not consciously connect their symptoms with an earlier trauma. Rather, when retraumatization occurs, "a current experience is subconsciously associated with the original trauma, reawakening memories and reactions" (SAMHSA, 2017, p. 1). Survivors who experience a traumatic stress reaction to a trigger that is similar to the reaction experienced in response to the original threat, can come to view the stimulus that caused the reaction as being dangerous, lowering the threshold for future retraumatization (Dallam, 2010). Retraumatization can therefore be **self-reinforcing**, as each instance increases the likelihood that another will occur.

Distinguishing retraumatization from revictimization

Retraumatization is also sometimes defined in the literature as the experience of **multiple successive traumatic events** of the same or different types (for example, an individual who is sexually assaulted and later experiences a natural disaster) (Follette & Duckworth, 2012). This is also referred to as "**revictimization**." However, for an event or situation to produce retraumatization, it does not necessarily need to have the potential to be traumatizing in and of itself (Alexander, 2012). Rather, it evokes a trauma response because of the way it interacts with the psychological and physiological state engendered by past injuries (Dallam, 2010). For the purposes of this review the term retraumatization is used to refer to the reaction a trauma survivor experiences to triggers, which includes but is not limited to revictimization.

Retraumatization triggers

Retraumatization occurs when a trauma survivor encounters a trigger. **Triggers** are "external cues that, based on past traumatic experiences, suggest to abuse survivors that their safety is at risk" (Dallam, 2010, p. 164). These cues can be experienced as threats to safety and reminders of potential harm for trauma survivors who exist in a state of hypersensitivity, as discussed above. It is the confluence of these individuals' hyperalert internal states and an external trigger that causes retraumatization to occur.

Three kinds of triggers can cause retraumatization. **Sensory triggers** directly recalling the original trauma through stimuli such as sounds, smells, physical sensations (Dallam, 2010). **Relational triggers**, can lead to retraumatization "because they replicate common power dynamics between victims and perpetrators" (Dallam, 2010, p. 82). For example, situations in which choice is taken away could be triggering for an individual who experienced control in the context of intimate partner violence. Relational triggers are particularly relevant in cases of interpersonal and developmental trauma. A third type of trigger involves a **combination of sensory and relational stimuli**. Reactions to sensory and relational triggers can include emotional symptoms such as "anxiety, panic, flashbacks, crying, guilt, shame, anger, grief, fear, sadness, despair, and/or hopelessness" (Dallam, 2010, p. 82). Physical reactions may include "dizziness, headaches, shaking, nausea, and/or vomiting" (Dallam, 2010, p. 82). Reactions may persist after exposure to the trigger has ended, and delayed onset reactions can include nightmares and insomnia (Dallam, 2010).

Childhood traumatization and retraumatization

Brain development and trauma exposure

The risk and impact of retraumatization is heightened for individuals for whom the initial trauma took place in childhood (Zayfert, 2012). Children who experience

trauma are at a heightened risk for retraumatization because of the particularly profound impact of traumatic stress on their developing and highly neuroplastic brains. When children are subjected to trauma, the form and functioning of stress-sensitive areas of their brains may be permanently altered (Cross et al., 2017; King & Liberzon, 2012). These **neurodevelopmental changes** can lead to "lifelong patterns of reactivity to stress and traumas" (King & Liberzon, 2012, p. 63). The nervous systems of individuals who experience traumatic stress during childhood may become hypersensitized by their frequent arousal, such that stress responses can be elicited by "decreasingly intense stimuli" (Dallam, 2010, p. 13). Furthermore, childhood trauma survivors may experience difficulty self-regulating, as the repeated activation of their physiological stress response system slows down the system's "off-switch," such that they remain in a fear state even in the absence of any real threats to their safety (Cross et al., 2019, p. 113). Their hypersensitivity to and difficulty managing stress predisposes these individuals to retraumatization when encountering even vague reminders of the original trauma.

Trauma and attachment

Even when exposed to extremely stressful events, not all individuals will become traumatized. This is in part because **individuals vary in their capacity to tolerate distress and to self-regulate**. One reason that many survivors of childhood trauma may struggle to self-regulate is because of their troubled attachment histories (van der Kolk, 2007). Attachment describes the connection a child has to their caregiver, whose role during the child's infancy is to support affective regulation by mirroring the child's emotions and helping to sooth them (Alexander, 2012). Children whose caregivers fulfill this role effectively and consistently develop organized and secure attachments. They eventually internalize the capacity to regulate their own affective states and manage stress. Conversely, children with disorganized and insecure attachments struggle to self-regulate, placing them at "a heightened risk for both initial trauma and retraumatization (Alexander, 2012). Therefore, **early attachment relationships** can act either as a protective factor, contributing to the individual's ability to cope with an initial trauma and buffering against retraumatization, or can exacerbate the impact of the initial event and aggravate the risk of being triggered. Additionally, children with disorganized attachments are likely to have experienced trauma at the hands of the very figures who are supposed to provide safety and comfort. This produces a shift in worldview such that "all persons [are viewed] as potential abusers," further exacerbating the hypersensitivity that contributes to retraumatization (Dallam, 2010, pp. 81-82).

Retraumatization in settlement, compensation, and justice-seeking processes

It is often assumed that legal or extralegal processes to seek justice or compensation are inherently healing or cathartic for survivors of interpersonal trauma (Doak, 2011; Broneus, 2008). However, research indicates that giving testimony following a traumatic experience can be retraumatizing (Lundy, 2020). As described in detail in the previous section on lessons learned in past settlements (**Exploring Lessons Learned From Canadian and International Approaches to Compensation Agreements** on p. 97), settlement and justice-seeking processes, such as compensation schemes, can be riddled with sensory and relational triggers. In the absence of sufficient safeguards, this can produce extreme distress in trauma survivors. The ensuing retraumatization can have adverse effects in the immediate and long term on these individuals, their families, and communities. This section examines common elements of settlement and compensation processes that contribute to the risk of retraumatization, drawing upon examples from past individual and collective settlement and justice-seeking processes in the Canadian and international context, including some reviewed in the previous section.

Sensory triggers in justice-seeking processes

Sensory triggers are conditions which can cause retraumatization because they directly recall stimuli present at the time when a trauma took place. Often, settlement and justice-seeking processes require the presentation of evidence including vivid descriptions and depictions of the traumatic events, which can act as sensory triggers. Survivors can also be triggered when they are required to present their traumatic histories. Furthermore, certain procedural and structural elements common to many of these processes, such as legal formalism and the requirement to disclose repeatedly, can exacerbate the impact of these sensory triggers, as explored below.

Disclosure and reawakening of traumatic memory

The most obvious trigger for retraumatization in settlement and justice-seeking processes is the discussion of an individual's traumatic history. Retelling past traumas can result in the **"unwilling [awakening]" of memories**, which are re-experienced or re-lived by the survivor as though they are occurring in the present (Colton, Vanstone, & Walby, 2002, p. 544). In a study of survivors of human rights violations who testified before the South African Truth and

Reconciliation Commission (South African TRC), one interviewee reported that when she recounted the traumatic events she experienced to the commission she "felt as if it was on the same day" that they originally occurred (Byrne, 2004, p. 247). Another described how images of the traumatic events kept returning to them involuntarily throughout the South African TRC process. This reawakening of traumatic memories may have a particularly significant impact on survivors who have not yet had the opportunity to process these memories in a supported and safe context (Crenshaw et al., 2019). Often, survivors of trauma suppress traumatic memories consciously or unconsciously in order to cope and function. As one residential school survivor stated "I had blanked out because it was too much to keep uppermost in my head. I repressed it… It's too emotional to bring this stuff up, to recall everything" (Dion Stout & Harp, 2007, p. 25). When describing traumatic history in the course of testifying or requesting compensation, survivors may be re-engaging with this history for the first time, increasing their vulnerability.

Exploring and reprocessing trauma can be an important part of **healing** from it. However, it is important that this reprocessing occurs in a **safe and controlled environment**, and in the context of an established and trusting relationship (Broneus, 2008), conditions rarely satisfied by settlement and justice-seeking processes. As Crenshaw, Stella, and Walsen (2019) state with reference to children testifying in court about experiences of abuse, "when the disclosure is forced by the pressures of the legal process, when there is no time to build a safe and trusting relationship, when sensitivity to timing and pacing is lacking, the risk of retraumatization increases" (p. 780).

Re-exposure to trauma poses a risk to survivors when it occurs in short and intensive bursts, rather than in a **slow and incremental process** directed and paced by the survivor. Exploring trauma in the latter manner **allows for integration, desensitization, and relearning** (Broneus, 2008). Over time, hypersensitivity lessens as the survivor has experiences that disconfirm the belief that triggers pose a real threat to their safety (Dallam, 2010). Their window of tolerance for stress therefore increases, and they safely re-examine trauma with less risk of retraumatization. However, few settlement and justice-seeking processes allocate the necessary time and resources for reprocessing to occur in this way. Often, trauma re-exposure takes place with little preparation or support, as discussed in further detail below. This kind of short and sudden exposure increases the risk for traumatic stress responses (Broneus, 2008).

For a proportion of survivors, the disclosure of traumatic experiences that takes place during settlement and justice-seeking processes represents **an opportunity for healing**. For example, in the aforementioned study of the South African TRC participants, a proportion of interviewees expressed the feeling they had benefited from the opportunity to share their stories publicly and openly (Byrne, 2004). Similarly, some residential school survivors spoke about the Indian Residential Schools Settlement Agreement (IRSSA) and associated compensation and truth telling processes as "having an impact on their ability to break the cycle of silence that has surrounded their experience of abuse" (NCTR, 2020, p. 6), and to "release the pain of dealing with their memories" alone (Reimer et al., 2010, p. 80). For these survivors, disclosure – while still emotionally challenging and intense – represented an important step in their healing journey.

Repetitive disclosures increase risk of retraumatization

In some settlement and justice-seeking processes, trauma survivors are not only required to recount their histories, but to do so multiple times for different audiences. For example, in the Independent Assessment Process (IAP) of the IRSSA (described in more detail in the previous section), survivors seeking compensation had to recount the details of the abuse they experienced as residential school students as many as four separate times: when completing an application form, speaking with an attorney, meeting with a support worker or therapist, and during the formal settlement hearing (Morrissette & Goodwill, 2013). They then had to repeat their stories again if they chose to participate in the Truth and Reconciliation Commission. On each of these occasions, survivors "[faced] the task of recalling, acknowledging, and describing traumatic events" which for some was distressing and triggered "painful memories and flashbacks" (Morrissette & Goodwill, 2013, p. 546). Dion Stout and Harp (2007) state that "requiring Survivors to not only prove their stories, but to tell them over and over again, was to be re-victimized" (p. 19). Child victims of sexual abuse who testify in court may also be required to repeat their stories numerous times throughout the investigation and trial process (Gavin, 2002). These children are most likely to be retraumatized when they are required to repeatedly disclose the details of their experiences (Gavin, 2002; Robinson, 2015). This is true not only when children have to repeat their stories before lawyers and judges, but also for psychologists, physicians, and social workers. In fact, **testifying more than once is "the factor most consistently associated with negative outcomes**" for child witnesses in trials (Robinson, 2015, p. 170).

Proving and measuring harm

Often in settlement processes the burden falls on those testifying to prove that they have been subjected to abuse and to what extent. Survivors are therefore required not only to recount their experiences but to do so in great detail and under the scrutiny of lawyers and adjudicators. Many settlement and justice-seeking processes test survivors' memories of the abuses they suffered, with a goal of proving or disproving their testimony, rather than one of healing (MacDonald, 2020). For example, the IAP processes of the IRSSA focused on establishing "provable abuses." To do so, survivors were **required to provide lengthy and specific descriptions of the abuses** they experienced as residential school students. This resulted in the retraumatization of up to one third of claimants (MacDonald, 2020). Furthermore, as described in the previous section, the IAP determined the awarded different amounts of compensation based on the "degree of victimization" that could be established by the claimant. Therefore, in order to maximize the amount of compensation they were eligible for, survivors not only had to prove that they had been abused but to detail specifically the worst parts of the abuse they experienced (Morrissette & Goodwill, 2013). One survivor stated that due to the "invasiveness, persistence and depth" of questions he was subjected to during the IAP process, "that day of my hearing, and the days that followed, were some of the worst days in my life second only to when my abuse actually occurred" (NCTR, 2020, n.p.). Claimants in the Jericho Individual Compensation Program (JICP), which compensated victims of sexual abuse at a British Columbia residential school for deaf and hard of hearing students, described the confusion and hurt caused by awarding different amounts of compensation based on the perceived severity of abuse (Batterbsy, Greaves, & Hunt, 2008). They spoke about the sadness and anger they experienced when they detailed the worst parts of their suffering, only to be told that their stories did not meet the threshold for the highest level of compensation, $60,000 CDN. In both the IRSSA and the JICP, requiring claimants to prove the severity of their abuse enhanced the possibility of **retraumatization by forcing disclosures of the worst parts of their trauma** in order to maximize the monetary benefits they were eligible for. This was something many participants needed to do, given their financial precarity which was often related to consequences of their trauma.

Formalism and restrictions on truth-telling

In several contexts, the formalistic nature of settlement and justice-seeking processes interfered with trauma survivors' ability to heal and contributed to retraumatization. Formalistic legal and bureaucratic systems insist on **procedural consistency, at the expense of creating a trauma-sensitive environment for survivors** (Katirai, 2020). This restricts survivors' ability to tell their stories on their own terms (for example, by choosing how long they take to tell their story, which details to include, if they wish to testify orally or in writing, etc.). Participants are only allowed to share parts of their experiences dictated by the conventions of the settlement or justice-seeking procedure. For example, claimants felt that the structure of the IAP process "[forced] them to re-interpret and express their experiences through a series of prearranged checkboxes and spatially-limited comment sections that [did] not entirely capture the violence that survivors have suffered" (Petoukhov, 2018 p. 185). This formalism reproduces a dynamic of abuse wherein survivors are silenced by an authority and denied control over their own lives and narratives (Katirai, 2020). As Katirai (2020) states, for survivors of intimate partner violence, the opportunity to tell one's own story in one's own way helps "to both reestablish control over their lives and to avoid exposure to specific reminders of the traumas they have faced" (p. 107). This ability to **re-establish control over one's narrative** may be particularly significant in terms of healing for child victims, whose "abuse-related experiences leave [them] unable to share the details of events due to the shame and secrecy and isolation that tends to come with childhood abuse (Crenshaw, O'Neill-Stephens, & Walsen, 2019, p. 780). When they are restricted in the way they formulate their narrative, these survivors are less likely to feel that their truth has been heard and acknowledged (Doak, 2011), which can increase the distress associated with participation and mitigate healing.

The requirement to provide a detailed account of the traumatic events they have experienced as a part of settlement and justice-seeking processes may create significant roadblocks for survivors and contribute to retraumatization. This is attributable in part to the fact that traumatic memory "is frequently encoded in areas of the brain not accessible to verbal expression" (Crenshaw, Stella, & Walsen, 2019, p. 780). The requirement that survivors precisely articulate the events that traumatized them is therefore unrealistic and unfair. Doing so is unlikely to elicit useful testimony and places survivors under stressful conditions that do not account for the neurological and cognitive impacts of trauma. Soueid, Willhoite, and Sovcik (2017) state that "because

trauma affects the memory in profound ways, often the emergence of emotional truth is equally as important as the facts" (p. 171). As settlement and justice-seeking are often focused on uncovering and proving facts, they tend to leave little room for other kinds of truth-telling that may be more conducive to survivors' effective participation and healing.

Relational triggers in settlement and legal processes

Relational triggers cause retraumatization because they replicate power dynamics experienced in the context of abuse or trauma. For many survivors, settlement processes may be retraumatizing because of the adversarial stance assumed by legal and bureaucratic personnel. The experience of being undermined, questioned, and disbelieved during their testimony may be all too familiar, particularly for survivors of childhood abuse. Reliving these sensations at the hands of a new authority may contribute to or cause retraumatization, as discussed below.

Trauma-insensitive personnel and administrators

The expectation that survivors prove the extent and nature of harms done to them through their testimony is one aspect of the adversarial legal model upon which many settlement and justice-seeking processes are based. Another aspect of this model is the **questioning and probing** to which survivors can be subjected to by administrators and adjudicators of these processes. One factor repeatedly cited as a cause of retraumatization is the attitudes and approaches of legal and bureaucratic personnel (Colton, Vanstone, & Walby, 2002; Katirai, 2020; MacDonald, 2020). These personnel very often lack the **training and experience** to handle the testimony of survivors **in a trauma-sensitive fashion**. For example, IRSSA participants found the government lawyers who questioned them to be "indifferent" and "hostile" (NCTR, 2020, p. 3) and lacking in the empathy and respect required to address their sensitive testimony (MacDonald, 2020). Survivors of historical institutional child abuse in the United Kingdom similarly reported feeling revictimized by police and social service providers when they participated in a large-scale abuse investigation (Colton, Vanstone, & Walby, 2002). Given the power dynamic inherent to the relationship between investigators and victims, it is critical that those involved in such proceedings thoughtfully approach the way they leverage their authority to avoid unwittingly reproducing abuse dynamics and retraumatizing survivors. When managed carefully, this relationship can play an important role in creating positive experiences for survivors who testify to their experiences.

The preparedness of personnel to interact with participants in a way that is trauma-sensitive is of particular importance in the case of children providing testimony. Studies of children who report sexual abuse and become involved in legal proceedings indicate that the most significant factor in mitigating harm and providing beneficial outcomes in these proceedings is the establishment of a trusting relationship with the investigator (Gavin, 2002). For such a relationship to develop, it is important for personnel to possess an understanding of child development, so that they can communicate with and involve children in a way that is developmentally appropriate and does not overwhelm their capacity for participation or understanding.

Adversarial structure

Many settlement and justice-seeking processes have been structured such that lawyers and bureaucrats occupied an adversarial position vis-a-vis survivors, wherein their role was to provide a counter to survivors claims and challenge their narrative of events. The approach to questioning and interacting with survivors taken up by these personnel can contribute to survivors **feeling as though their experiences are being dismissed and disbelieved** (NCTR, 2020; Katirai, 2020). For survivors of abuse, and childhood abuse in particular, being discredited and undermined by opposing counsel after recounting their traumatic history may mirror experiences they had at the time the trauma took place, and reinforce feelings of powerlessness and lack of safety. For residential school survivors, feeling that their testimony was disbelieved by lawyers, government officials, and judges throughout the CEP and IAP contributed to retraumatization and "compounded the hurt" of the initial injury (NCTR, 2020, p. 29). In the context of intimate partner violence, survivors who testified against their partners in court only to be met with "negative or unresponsive behaviours" by members of the court experienced these responses as "a further violation that [echoed and related] to the original [abuse] they experience" (Katirai, 2020, p. 89).

Some justice processes have employed **alternatives to the traditional Western adversarial legal model** in order to avoid reproducing this dynamic between survivors and administrators. For example, in the JICP, claimants gave their statements to a compensation consultant rather than directly to the three-person decision making panel (Battersby, Greaves, & Hunt, 2008). Compensation consultants were all trained counsellors who were knowledgeable in Deaf culture and childhood sexual abuse and spoke American Sign Language. Once claimants

had taken as long as they wished to tell their story, the consultant brought the claim to the panel. Claimants only had to go before the panel themselves if they appealed the decision in their case. Unlike the adversarial model, this approach prioritized the safety and mental health of the claimants, while still collecting the necessary information to render a decision in their cases.

Cultural insensitivity

Crucially, as highlighted in the previous section, for Indigenous claimants engaged in settlement processes with the Canadian government, the system of adjudication itself may act as a relational trigger because it is embedded within the same systems within which the original harm was done. Settlement processes may be retraumatizing because of the ways they **reproduce the colonial structures and dynamics that produced the initial trauma**. In her examination of the plan for the Canadian Truth and Reconciliation process, Hughes (2012) writes that participants would likely be retraumatized by lawyers who represent a legal system which is "deeply implicated in the story of oppression of indigenous peoples in Canada" (p. 119). In the context of the IRSSA, the NCTR (2020) states that "of the harm that was created, the source of much of this was doing things the "same old way" rather than adopting and implementing fully informed Indigenous practices and approaches" (n.p.). Furthermore, survivors felt that "[support] services based within the Western education or social work systems were ineffective in addressing [healing] needs, compared to culturally-based, community based healing services" (NCTR, 2020, p. 23). Throughout the IRSSA, "one of the greatest demands for support was cultural intervention provided by Elders in the community" (Reimer et al., 2010, p. 75). Nagy (2013) explains that Indigenous forms of healing go beyond compensation and truth-telling and include decolonization, cultural and language revitalization, and the adoption of Indigenous methodologies. These forms of healing take a more structural approach, as "healing without changing the social and political conditions that first caused the injuries would be ineffectual" (Episkenew, 2009, p. 17).

Some residential school survivors felt that the TRC was easier to navigate and more beneficial to them as individuals and to their communities because unlike the IAP and CEP it centred Indigenous culture, spirituality and healing (MacDonald, 2020). "**Ceremonies**, prayers, beliefs, and values played a central role," and **spiritual practices** including "prayers and smudging, water and fire ceremonies" were incorporated into the proceedings (MacDonald, p. 160).

Furthermore, while a common framework guided the organization of all TRC events, consultation with "local peoples and Elders" played an important part in ensuring the cultural sensitivity and relevance of each session (NCTR, 2020, p. 15). This allowed the Commission to respond to the healing needs of each community and to implement culturally and spiritually relevant supports **to mitigate the risk of retraumatization**. Similar efforts were made in the JICP to ensure the process was accessible and culturally sensitive and relevant to the Deaf community (Battersby, Greaves, & Hunt, 2008). For example, all compensation consultants were fluent in American Sign Language, and all personnel involved in administering the process were provided training on Deaf culture. However, as was the case with the TRC, participants still felt that the process fell short in terms of demonstrating a nuanced understanding of their culture and integrating it on a structural level into the construction of the compensation package and process.

Gaps in support services

As discussed above, the safe reprocessing of trauma can only occur within the context of safe and supportive relationships, which may look differently depending on the needs and background of each survivor. However, in many settlement and justice-seeking processes, the support offered to participants falls short at a number of critical junctions, including in the preparatory phase, the period following their testimony, and during lengthy waiting periods (see the previous section for more detail). These are points of heightened vulnerability during which there may be an additional risk for retraumatization when adequate support is not provided, as explored further in this section.

Preparatory support services

Claimants in a number of settlement and compensation processes expressed how a lack of support during the periods preceding and following their disclosure contributed to their retraumatization. Many claimants felt **emotionally underprepared** to testify. As discussed previously, for many, giving testimony represented the **first time they re-engaged with and recounted** their trauma since it occurred. Supportive counselling in the period leading up to their testimony could have equipped them with tools to cope with distress that arose when grappling with difficult memories. Furthermore, survivors in a number of cases felt ill equipped to comprehend procedural elements of the processes they were taking part in and did not have a clear understanding of how they would be expected to participate (Lundy, 2020; Battersby, Greaves, & Hunt,

2008). When survivors are not made aware of what procedures will look like or what their participation entails, they are less able to anticipate potential triggers, take preventative steps to mitigate their retraumatizing effects, and plan for the family, community, and professional support they need. Furthermore, the confusion and lack of control survivors experience when they are underprepared to participate may reproduce feelings, such as having loss of agency, associated with their trauma, creating yet another potential relational trigger.

While a lack of understanding of complex and legalistic proceedings may pose challenges for any participant, this issue is particularly salient for **children**, who generally have less existing knowledge of the legal system and **less capacity to absorb and process** new terminology and procedures (Robinson, 2020). Children who are better prepared with knowledge of the legal system and adjudication process "experience significantly lower levels of anxiety and provide enhanced testimony" (Robinson, 2020, p. 175). However, developmentally- and trauma-insensitive courtroom processes and administrative personnel often fail to take children's needs into account and neglect to take preparatory steps to minimize their distress.

Follow up support services

Participants in a variety of justice processes also described how the **lack of follow up and support** in the aftermath of their participation **contributed to their distress**. Lundy (2020) describes how for individuals going through Historical Institutional Child-Abuse Inquiries, even those who experienced some positive emotions in the period immediately following their testimony found that the "glow quickly fades" in the absence of support needed after this challenging and emotional experience. This left them with "a traumatic sense of abandonment" (Lundy, 2020, p. 265). In one study of survivors of historical child abuse in UK residential institutions who gave evidence in large scale investigations, interviewees noted how support abruptly diminished after the completion of investigations, and emphasized the need for "highly skilled long-term counselling and psychiatric help," even after they came to a close (Colton, Vanstone, & Walby, 2002, p. 546). Similarly, women who experienced violence during the 1995 Rwandan genocide and participated in the gacaca courts, a traditional conflict resolution system, stated that no one (professional or community member) visited them at home following their testimony to see how they were doing (Broneus, 2008). This contributed to a strong sense of loneliness and vulnerability. These women reported feeling isolated from their communities, which interfered with reestablishing a sense of safety and security following the trauma of the genocide. Claimants in the JICP noted a similar shortcoming in support. The claimants, many of whom had traveled far from home to take part, reported that they were sent back to their hotel rooms alone after testifying to await the resumption of proceedings the following day, with no one to check in on them as they processed the day's events (Battersby, Greaves, & Hunt, 2008). For some participants, feelings experienced during this time mirrored the isolation they felt when they were sexually abused as children, contributing to their retraumatization.

Waiting periods

As highlighted in the previous section, participants in several settlement and justice-seeking processes, drew attention to the **need for support, as well as transparency and communication, during waiting periods** – both between the initial disclosure of abuse and formally testifying, and between testifying and the rendering of a decision. These were identified as periods of high anxiety, during which participants were often left in the dark, without updates on the timeline or status of their cases (Morrissette & Goodwill, 2013; Colton, Vanstone & Walby, 2002). A study indicated that children who testified in court after disclosing that they had been sexually abused had poorer mental health outcomes when there was a longer waiting period between their initial disclosure and the trial date (Gavin, 2002). Residential school survivors who applied for compensation via the IAP often had to wait several months following their initial disclosure before a formal hearing was scheduled (Morrissette & Goodwill, 2013). During this time, survivors were forced to confront "memories of their trauma, the implications of their disclosure, and the anxiety surrounding their impending hearing" (Morrissette & Goodwill, 2013, p. 548).

Residential school survivors also experienced distress in the lengthy waiting periods after their testimony, as they anticipated the delivery of a decision and payment. Survivors found **navigating bureaucracy to get updates on the status of their cases during this time confusing and frustrating**, and felt disregarded by the Canadian government (Dion Stout & Harp, 2007). Some felt that the repeated delays in the receipt of payments reproduced the dynamic between residential school students and staff. One survivor stated that for some "it [was] residential school all over again for them. I'll give you a candy tomorrow if you behave, but tomorrow never comes" (Dion Stout & Harp, 2007, p. 21). These changing timelines and broken promises therefore act as yet another relational trigger that contributes to the retraumatization of survivors taking part in these processes.

In some cases, survivors reported that support services offered as part of justice seeking and compensation processes did contribute to their coping. Some support services funded by the Aboriginal Healing Foundation were found to be effective in promoting healing for IRSSA claimants, particularly when they were staffed by individuals who were residential school survivors themselves (Reimer et al., 2010).

Settlement and compensation process outcomes and retraumatization

Accepted claims

The impacts of retraumatization can be compounded when survivors endure the arduous process of testifying to their experiences, only to find that doing so does not lead to change on a personal or societal level (Soueid, Willhoite, & Sovcik, 2017). Lundy (2020) states that testifying to past traumas **can only prove psychologically beneficial to survivors when the goals of "uncovering truth, delivering justice, and making reparations" are realized** (p. 259). These goals may be achieved in part through official recognition of the abuse that claimants experienced and awarding of compensation. However, even when participants are successful in seeking compensation, financial payments may not be enough to advance their healing, and in some cases can also contribute to retraumatization.

For some residential school survivors, it was **the receipt of compensation payment** that caused traumatic memories to "[come] flooding back," "**triggering** an intense emotional reaction" (Dion Stout & Harp, 2007, p. 33). For others, there was the feeling that financial compensation could never replace what was lost of their childhoods, cultures, and families (Reimer et al., 2010). For these individuals, receiving the payments triggered difficult emotions because of how insignificant they felt in comparison to the harms they had experienced. However, for about one quarter of CEP compensation recipients, financial compensation represented **a step forward** in their healing, not only because of the material benefits it offered in terms of relieving debt or allowing them to purchase needed items for themselves and family members, but also because of what they felt it represented. Many felt that the compensation they received represented a tangible **acknowledgement** of their suffering which provided them with an important sense of closure (Reimer et al., 2010). For others, the payments allowed them to access health and wellness services and relieve financial stress. Ultimately, nearly half of CEP claimants who received compensation described it as being both a positive and negative experience.

Individual compensation and recognition are limited in their capacity to provide truth, justice, and reparations (Lundy, 2020). On a community level, when survivors engage in compensation and justice-seeking processes only to return home to communities that remain "destroyed or impoverished," they cannot reap the psychological benefits of giving testimony (Hamber & Lundy, 2020, p. 750). In one study, survivors of childhood institutional sexual abuse who participated in a large-scale inquiry emphasized their need not only for individual recognition and compensation but also for system level changes (Hamber & Lundy, 2020, p. 761). Other studies have indicated that "guarantees of non-repetition" are integrally linked to healing for victims of political violence (Hamber & Lundy, 2020). Importantly, for transitional justice and related processes to be beneficial and not harmful or retraumatizing, they need to create **opportunities to heal not only on an individual but also on a community and societal level**.

Rejected claims

Traumatic stress and suffering can be **compounded when claims are rejected**. For the residential school survivor community, rejected IRSSA claims "did some of the most harm to individuals and created significant pain for many" NCTR , 2020, n.p). It was not simply the lack of monetary compensation that caused this harm, but the implied invalidation of survivors' experiences, which caused them to feel "re-victimized and de-valued" (NCTR, 2020, p. 30). Some survivors described how receiving a partial payment or having their application denied "re-awakened feelings of rejection" they experienced during their time in residential schools, describing this experience itself as a type of abuse (Reimer et al, 2010, p. 38). One individual whose CEP claim was denied emphasized the relatively low importance of the financial implications of the denial, asking ""I just want the truth...Why can't anybody hear me?"" (Reimer et al, 2010, p. 34). The impact on survivors can be particularly profound when the reason for the rejection is a missing or inaccurate school records (NCTR, 2020). Survivors who were told that records did not validate their residential school attendance said that they were "made to feel like liars" (Reimer et al, 2010, p. 95). This bureaucratic erasure of their experiences "can feel like a slap in the face" after the traumatic stress claimants are subjected to during the claims process (Dion Stout & Harp, p. 24).

Impacts of retraumatization in settlement processes

Individual Impacts

When participants in settlement and justice-seeking processes are retraumatized, a variety of adverse physical, psychological, and social outcomes can follow. Retraumatization reopens wounds, often setting back the healing process and reinforcing patterns of hypersensitivity that increase vulnerability to future injury. During and in the immediate aftermath of their participation, residential school survivors who testified during the IRSSA reported experiencing a level of distress similar to that associated with the original trauma (NCTR, 2020). They experienced painful emotions and traumatic flashbacks (Reimer et al., 2010). Participants in the South African TRC also experienced "a return and intensification of symptoms associated with the original violations as well as the onset of new symptoms" (Broneus, 2008, p. 61). Other groups, including survivors of institutional childhood sexual abuse, reported a similar intensification of symptoms and return of problems associated with the original trauma (Hamber & Lundy, 2020).

Long term consequences of retraumatization include mental health problems such as **anxiety and depression** (Dallam, 2010; Reimer et al., 2010). Soueid, Willhoite, and Sovcik (2017) report that in post conflict societies, survivors of violence who participate in transitional justice processes have higher rates of PTSD and depression than those who do not. Participants may also engage or reengage in avoidant coping behaviours. For example, retraumatization may contribute to the onset of or relapse in **substance misuse**, one outcome for some IRSSA and JICP participants (Reimer et al., 2010; Macdonald, 2020; Battersby, Greaves, & Hunt, 2008). Lastly for some, retraumatization may contribute to **suicidal ideation**, and some individuals who testified in IRSSA processes died by suicide following their participation (Macdonald, 2020; CBC News, 2020).

Finally, retraumatization may **dissuade participants from engaging in further compensation and justice-seeking** processes in the future. For example, survivors of intimate partner violence with previous experiences of retraumatization in the legal system "may settle for less in mediation or settlement negotiations or opt out of participating in the legal system altogether" in order to avoid additional harm (Katirai, 2020, p. 85). Some CEP applicants whose initial requests for compensation were denied were dissuaded from applying for reconsideration because they preferred to avoid further reengagement with their past trauma (Reimer et al, 2010). Ultimately the trauma-insensitive nature of these processes – whose nominal goal is to support justice and healing – can push survivors out of the legal system, denying them opportunities to heal through justice and reconciliation.

Not all individuals who take part in settlement, compensation, and justice-seeking processes are retraumatized, and some find the experience contributes to improved mental health and healing. Some participants also reported experiencing positive feelings, such as an **increased sense of control and decreased shame**, in the period following their testimony (Espinoza et al., 2017). For some, the reopening of past traumas acted as a **catalyst in their healing** journey, leading them to seek out needed support (Reimer et al., 2010). One study of Rwandan victims of ethnic violence who testified at the gacaca courts found that testifying was associated with decreased shame and restored sense of dignity (Kanyangara, 2008 cited in Martín-Beristain et al., 2010). Other studies have indicated that participation in transitional justice processes increases participants' sense of control and efficacy, both important areas for healing from trauma and interpersonal abuse (Espinosa et al., 2016).

Community impacts

When collective trauma impacts a community on a large scale, as is the case in many settlement, compensation, and justice-seeking processes, it "disrupts the fabric of communal life, challenging core social institutions and cultural values" (Kirmayer, Lemelson, & Barad, 2007, p. 10). These same institutions and values are the resources relied upon to promote collective healing. The collective vulnerability of a community to retraumatization therefore relates in part to its existing coping resources (Schumm, Doane, & Hobfoll, 2012). Individuals whose **social networks lack coping resources** are more likely to experience severe post-traumatic stress reactions. Furthermore, groups with less access to coping resources due to racialization and marginalization can have greater collective vulnerability and greater difficulty adjusting when retraumatization occurs in their community. These groups are therefore more likely to experience individual and collective difficulties in response to the traumatic stress of some settlement, compensation and justice-seeking processes.

Settlement and justice-seeking processes can function to **promote healing on a community level** by creating opportunities for connection and unity when traumatic histories are brought into the open. While "the process of

healing from childhood trauma may at first be deeply personal," as survivors reprocess their experiences, they begin to situate these experiences in the context of their families and communities, as well as the global sociopolitical context (Nagy, 2013, p. 66). Nagy (2013) writes that the Canadian Truth and Reconciliation Commission was seen as an important tool in achieving this broader understanding by facilitating the fulfillment of collective psychosocial developmental tasks (Nagy, p. 66). In doing so, it promoted **a shift among some survivors from working through their trauma in isolation to collectivizing their experiences** and mobilizing towards healing and growth. Participants in the Canadian TRC process mentioned that the hearings were "the first opportunity they had for family members to witness one another's truths" (NCTR, 2020, p. 6). Recipients of the CEP reported that the settlement promoted dialogue, created opportunities to connect across generations, and removed emotional barriers (Reimer et al., 2010). After connecting during IRSSA events, some residential school survivors went on to form support groups together and to join in advocacy efforts (NCTR, 2020).

Conclusions

Taking part in settlement, compensation, and justice-seeking processes is **not inherently healing, nor is it necessarily retraumatizing**. As demonstrated in this literature review, several features and structures common to these processes can contribute to an increased risk for retraumatization by creating more frequent and intense exposure to sensory and relational triggers. Along with the operational details and lessons learned from past settlement processes in the previous section, the information in this review can provide valuable considerations for administrators of the upcoming compensation process in Canada. **The operational details of a settlement or compensation process have direct implications for the individual wellbeing of claimants**. When uncovering sensitive details and upholding procedural standards are made the priority of these processes, survivors, their families and communities are exposed to unnecessary traumatic stress, to the detriment of individual and collective wellbeing. As Doak (2011) explains, these processes cannot be healing when they prioritize broader social and political objectives over the needs of participants themselves. To minimize the risk of retraumatization, architects of settlement and justice-seeking processes must rethink their design in a way that centres survivors. This necessitates shifting away from adversarial, formalistic structures, toward culturally-based, trauma-sensitive alternatives. Even still, some risk of retraumatization is inherent to processes in which survivors must re-engage with their trauma, and it is important that survivors are provided with the information and support they need to understand the possible advantages and disadvantages of taking in any settlement or justice-seeking process (Byrne, 2004).

Trauma-informed approaches

A trauma-informed approach encompasses a number of practices and strategies that seek to mitigate the risk of retraumatization to individuals and communities (CAMH, n.d.; SAMHSA, 2014). Trauma-informed settings realize the widespread impact of trauma, recognize its signs and symptoms, and respond by integrating trauma awareness at all levels of functioning (Klinic Community Health Centre, 2013; SAMHSA, 2014). Trauma-informed approaches are distinct from trauma specific services in that they do not necessarily address trauma directly, but integrate an organizational awareness of and sensitivity to trauma throughout all activities. Regardless of the overall mission, a trauma-informed approach can be instituted to support healing, build trust, and mitigate potential risk of retraumatization (Klinic Community Health Centre, 2013).

Core Principles of Trauma-Informed Approaches

A number of trauma-informed frameworks have been developed in recent years. While they differ to some extent, they share a number of common fundamental principles:

Trauma awareness. Trauma-informed organizations recognize the pervasiveness of trauma and the diverse ways in which it impacts survivors (Klinic Community Health Centre, 2013). Staff are trained to the varied signs and symptoms of trauma. This includes an awareness of how gender, culture, and age may influence trauma presentation (SAMHSA, 2014).

Universality. A trauma-informed approach is applied universally, regardless of trauma disclosure or of the nature of the services provided (CAMH, n.d.). An understanding that all people involved in an organization may be impacted directly or indirectly by trauma informs all areas of functioning and is embedded in the organizational culture (SAMHSA, 2014). Budgetary, staffing, policy, and operational decisions are all made using a trauma-informed framework (Klinic Community Health Centre, 2013).

Safety. Trauma-informed organizations cultivate an environment that supports the physical and psychological safety of all people interacting with the organization (CAMH, n.d.). Both the physical setting and interpersonal interactions promote a sense of safety (SAMHSA, 2014). An effort is made to eliminate all intentional and unconscious forms of violence to promote a culture of safety in which healing is possible (Bloom & Farragher, 2013). An awareness of potential triggers is instrumental in establishing a safe environment. Safety is understood as defined by those served and in a way that is culturally-responsive.

Acknowledgement of strengths. Rather than focusing on deficits, trauma-informed organizations recognize people's strengths and leverage them as a foundation upon which to build resilience (SAMHSA, 2014). "Maladaptive" behaviours are reframed as survival skills which allowed people to endure their traumatic experiences (Sanctuary Institute, 2017). The organization endeavours to instill the individual with coping skills that are more adaptive to their present circumstances.

Engagement and empowerment. A trauma-informed approach recognizes that organizations often reproduce the unequal power dynamics in which trauma occurs, which can trigger retraumatization (Klinic Community Health Centre, 2013). To combat this tendency, trauma-informed organizations actively seek to level power imbalances by engaging individuals as collaborators and involving them actively in decisions that impact them at the individual and organizational level (SAMHSA, 2014; CAMH, n.d.; Klinic Community Health Centre, 2013).

Trustworthiness and transparency. Trauma-informed organizations engage in consistent, open communication with everyone they come into contact with (Bloom & Farragher, 2013). Communication contributes to transparency in their operations and decisions (SAMHSA, 2014). An emphasis on open communication and transparency helps establish a sense of safety, control, and agency that trauma survivors often struggle to regain, and protects against future abuses of power (Bloom & Farragher, 2013). When trust is breached, trauma-informed organizations rebuild it by acknowledging and repairing the harms they have caused (Bloom & Farragher, 2013).

Peer support. Trauma-informed organizations create opportunities for trauma survivors to build healing relationships by engaging in peer support (SAMHSA, 2014). They recognize the value of lived experience and encourage survivors to use their experience to support one another while also empowering themselves.

Social responsibility. Trauma-informed approaches involve an understanding of the role that social injustices and inequities play in creating trauma, and how these social problems can manifest at the organizational level (Bloom & Farragher, 2013). They recognize that addressing these problems is an important part of healing. They attend to the intergenerational impact of the historic traumas experienced by members of certain social groups, including Indigenous peoples (SAMHSA, 2014; Linklater, 2011). They reflect on and actively work against their own biases and prejudices, and accept others' worldviews that differ from their own (SAMHSA, 2014; Linklater, 2011).

Indigenous trauma-informed approaches

Renee Linklater (2011) situates wellness and holistic healing at the centre of Indigenous trauma-informed approaches. She describes how the four areas of the self – physical, emotional, mental, and spiritual – must all be cared for and balanced for healing and wellness to be possible. Wellness is achieved through relationships and connection with one's self, one's family and community, and with Creation. Indigenous trauma-informed approaches focus on strengthening all of these relationships through a variety of practices. Medicine Wheels can be used to model harmony between the four areas of the self and to transmit cultural knowledge related to healing. The spiritual self can be strengthened in part by facilitating access to traditional medicines, ceremony, and prayer. It is also important to promote the strengthening of Indigenous identities, which have been undermined by colonialism and which can serve as an important foundation for healing from trauma. Strengthening these identities can allow for reconnection with cultural teachings an practices that promote wellness.

Indigenous trauma-informed approaches recognize the expertise of communities on their own healing needs and encourage their involvement. They also recognize the importance that those working with individuals with trauma be engaged in their own healing process and be provided with healing opportunities by the organizations in which they are situated. Finally, Indigenous trauma-informed approaches use restorative justice practices, which have a longstanding history in Indigenous communities, to repair past harms by recognizing how these harms happened and creating opportunities to move forward "in a healing way" (p. 159).

Summary: Possibilities for Building on the Compensation Framework

Based on the topics identified in the sections above regarding process-related concerns expressed by respondents, lessons learned from past settlements, and the review of retraumatization literature, we have identified key elements that could be applied to certain aspects of the compensation process – the second piece of our project mandate. We have summarized opportunities for several aspects of the process – the notice plan, application design, provision of support, and processing claims. The key themes we identified mirror findings identified in the summary of lessons learned from past settlements, and include findings integrated from our review of retraumatization and the process-related concerns expressed by respondents.

A summary of the key findings of our reviews of past settlements, retraumatization, and process-related concerns from respondents that could inform operational aspects of the upcoming compensation process are described in Table 3.5.

In order to summarize opportunities for findings that could inform the compensation process, we compared the themes in Table 3.5 to elements of the *Final Compensation Framework* to identify if and how the future process may benefit from the learning that emerged from our reviews. Highlights of this informal analysis are summarized below. The resulting considerations may be of use to the parties, the class counsel, and the administrator in negotiations and planning for the settlement agreement and subsequent implementation of compensation.

Notice plan

Participatory approach to communications strategy. The *Final Compensation Framework* describes a process by which the AFN and the Caring Society worked to develop some of the resources contained within the *Notice Plan*. It describes consultation with First Nations youth in or formerly in child welfare placements (p. 48). As this process related to the *2019 CHRT 39* decision, a similar participatory process could be applied to the upcoming settlement agreement in order to validate the communications strategy.

Development of Notice Plan materials to ensure accessibility in terms of language, format, and technology. The stated goal of the materials to be disseminated through the *Notice Plan* is to "ensure that beneficiaries understand who is eligible for compensation and how the process works, if they chose to seek compensation pursuant to the Compensation Process" (*Notice Plan*, p. 8). The *Notice Plan* provides for the development of numerous forms of media (such as social media, pamphlets posters postcards, and videos; *Notice Plan*, p. 4). It is stated that the materials will be available in French, English, and "as many First Nations languages as possible" (*Notice Plan*, p. 4). There are

Table 3.5 Key findings of review of opportunities to build on the Final Compensation Framework

Notice Plan	→ Participatory approach to communications strategy → Development of notice plan materials to ensure accessibility in terms of language, format, and technology → Ensuring consistency and clarity in publicly disseminated materials (e.g., eligibility, process, compensation amount)
Application Design	→ Planning for inclusive access to the compensation process → Articulating what cultural sensitivity means for the process → Respecting data confidentiality/ownership → Minimization of legalistic language → Minimization of strict timeframes → Reduction of the potentially harmful burden of proof being placed on claimants
Provision of Support	→ Providing support in advance of the application → Consideration of the impact of the process on individuals and communities, with particular attention to how agencies will be impacted (both operationally and in terms of their role in the community) → Providing support to claimants in legal, mental health, administrative, and financial areas during the application process → Providing follow up support for both accepted and rejected claims → Avoiding repetitive disclosure and triggers during the appeals process
Claims Processing	→ Adequate preparation before claims processing begins, including how technology will be used and how payment challenges will be overcome → Accommodating gaps in resources and documentation to move claims forward → Planning ahead to avoid trauma-insensitive personnel and administrators → Limiting delays and waiting periods and planning how this will be addressed with claimants and communities when it happens

provisions for materials to "accommodate persons with disabilities, children and youth and those located in rural or remote communities" (*Notice Plan*, p. 4). For example, how will communications to children and youth be designed? How will different social media platforms be used to target different demographic groups? By what process will such questions be answered?

Ensuring consistency and clarity in publicly disseminated materials (e.g., eligibility, process, compensation amount). The *Final Compensation Framework* references compensation eligibility according to the *2019 CHRT 39* compensation decision. Following the recent agreements-in-principle, the general framework has shifted eligibility for both child welfare and Jordan's Principle compensation categories. Such changes over recent months and years regarding who is eligible for compensation, and why, may be confusing for potential beneficiaries once a final settlement agreement is reached. Accordingly, clear communication regarding eligibility, process, and compensation amount may reduce confusion and harm to individuals who ultimately are not eligible for compensation and streamline the process for those who are. This is particularly relevant as the negotiations have been highly publicized and subject to a number of pivotal legal moments that have had implications for eligibility following the *2019 CHRT 39* decision. Systematically updating the *Notice Plan* according to the settlement agreement (once finalized) will be necessary to ensure consistency and clarity, both for claimants and administrators.

Application design

Planning for inclusive access to the compensation process. The *Final Compensation Framework* discusses a number of ways in which the information about applying for compensation will be disseminated: "Where appropriate, communications will be adapted to the particular cultural, historical and geographical (including rural and remote communities) circumstances of the communities in question (s. 5.2)." The *Notice Plan* expands on the ways in which the process will be tailored to accommodate the geographic and linguistic diversity of the claimant pool (*Notice Plan*, p. 7). These include consideration of residence in urban, rural, northern and remote/isolated communities, or outside of Canada, and residence in health care facilities or domestic violence shelters, or individuals who are experiencing homelessness or are incarcerated (*Notice Plan*, p. 7). There are also provisions for materials in English, French, First Nations languages, American Sign Language (ASL) and the Langue des signes du Québec (LSQ). There is a need for specification of which First Nations languages will be included, and how other accessibility considerations will be accommodated (e.g., sight-challenged people) .

Articulating what cultural sensitivity means for the process. There are multiple references to cultural safety, cultural relevance, cultural sensitivity, and cultural appropriateness in the compensation process (e.g., s. 5.1; *Notice Plan*, p. 4). However, this is not defined operationally. If a trauma-informed approach is integrated throughout the compensation process, the risk of retraumatization may be mitigated (please see **Summary: Key Risk and Protective Factors** on p. 117). As cultural sensitivity related to First Nations is tied up in a history of harmful actions on the part of the federal government, there are opportunities to acknowledge this in tangible ways. Among many other possibilities, this could include operational considerations such as how the phone lines are staffed to reduce or eliminate wait times or the language choices operators are trained to use. The focus should be on serving individuals rather than reinforcing strict bureaucratic processes.

Respecting data confidentiality/ownership. There is clear attention to the importance of privacy rights of claimants (e.g., *Final Compensation Framework,* s. 2.4, s. 8.1; *Notice Plan*, p. 8). These provisions for privacy rights relate to the privacy of information provided for compensation and held at ISC. There is also provision for individual claimants to obtain information held at ISC that may be necessary for compensation. Consent processes must be clear from a legal and operational perspective. For example, how will consent be obtained from individuals to seek information from child welfare agencies? How will confidentiality be protected regarding this information?

Minimization of legalistic language. Inclusion of "simple" language is mentioned a few times regarding the communications process (e.g., *Notice Plan*, p. 14), however, the claim package included in the *Notice Plan* is 19 pages long, and is very administrative – similar to forms from past settlements we reviewed (*Notice Plan*, Annex B). Overly complicated legalistic terminology that could lead some eligible claimants to be rejected due to mistakes in application forms. While the details of eligibility determined through the ongoing negotiations will ultimately have bearing on the specific details of the application process, there are likely ways in which the format and procedure for applying may be tailored to facilitate the process for claimants. Paper applications, which are necessary for claimants who do not have access to

internet, can be created in visually streamlined, linear fashion that makes clear which sections are optional or only for certain claimants. Other formats could also be considered. For example, an online application questionnaire built using skip logic (e.g., questions asked are conditional on the previous answers) could be convenient for a large number of applicants. Similarly, an apply-by-phone option could be established by which claimants are supported in answering the questions posed by trained staff who use the online or paper form to enter the claimant's information.

Minimization of strict timeframes. The *Final Compensation Framework* describes a Timeline for the Compensation Process, which entails an initial claims deadline of 24 months following the Implementation date, along with a First Extended claims deadline of 12 additional months for certain specific situations, and a Second extended claims deadline of 6 months after that (ss. 7.1–7.4). Following the initial application periods, the administrator will work with ISC to create a Post-Claim Period Guide which will support any additional claims that arise (s. 7.5). Such provisions for flexibility in timing are positive aspects of the *Final Compensation Framework*. However, the claims deadlines remain short given the size of the claimant pool as well as the difficulties that will arise in identifying potential claimants. Previous Canadian compensation frameworks analyzed in this section ultimately provided claimants with five years to submit their claims.

Reduction of the potentially harmful burden of proof being placed on claimants. In the *Final Compensation Framework* there is attention to operational efforts to find existing information that could support claims that does not rely on claimants (e.g., ISC data, organizations' data). The *Final Compensation Framework* also includes explicit recognition of the necessity for flexibility in documentation related to challenges that may be insurmountable, such as "the child's age or developmental status at the time of the events, the disappearance of records over time, retirement or death of professionals involved in a child's case, systemic barriers to accessing professionals, etc." (s. 2.5.1). However, it is not clear how the burden on individuals will be reduced. For example, how will claims be approved when information is not available? How will the burden on claimants be minimized in these cases? While prior settlement processes have incorporated an option for claimants to speak to their experiences in the face of missing documentation, this can be damaging and retraumatizing. Claimants are not responsible for the missing information and acknowledging this outright – will lessen the burden on individuals. Financial and technical support provided to data-holders such as child welfare agencies and other service providers may mitigate this burden (see next section for more details).

Provision of support

Providing support in advance of the application. The *Final Compensation Framework* describes the presence of a phone line that will be available beginning with phase 1 of the process, along with a phone line provided by the AFN (*Notice Plan*, pp. 5–6). There is also a website mentioned on the site (**https://www.fnchildcompensation.ca**) which would function as a source of information prior to the process beginning. However, until recently, this website was out-of-date, mentioning the AIPs but still indicating eligibility criteria related to the CHRT decision. To ensure basic information provided to potential claimants is correct, existing websites could be updated to direct potential claimants to one website so there are not multiple websites telling individuals conflicting information regarding whether they may be eligible. In the *Notice Plan*, it is mentioned that there will be Canada-funded mental health supports provided through a variety of formats (p. 31). Further detail regarding when this will be available to all claimants will be required to ensure services may be accessed in a timely manner in order to function as preparatory support.

Consideration of the impact of the process on individuals and communities, with particular attention to how agencies will be impacted (both operationally and in terms of their role in the community). The need for operational support to child welfare agencies and health and social service providers is clearly acknowledged (e.g., *Final Compensation Framework*, s. 5.4). Given the potential availability of data at the agency level, generous support for record retrieval not requiring onerous paperwork will likely make the process more expedient as it did in the Motherisk data extraction process in Ontario (see **Case example: Motherisk** on p. 99). The concerns we heard from respondents regarding how the process may impact community dynamics should also be considered. Individuals may blame agencies for removals, which should be mitigated by clear, consistent communication regarding the responsibility of the federal government for the discrimination on which the compensation is based. Avoiding the use of evocative terms like "necessary" and "unnecessary" removal can also help support agencies during this process and minimize tensions. As agencies and providers may function as allies to individual

claimants (e.g., by providing information about the process and documentation proving eligibility to support their claims), communication to both agencies and individuals could reinforce this messaging.

Providing support to claimants in legal, mental health, administrative, and financial areas during the application process. There is variable mention of these forms of support being provided to claimants, and opportunity for further detail to be articulated regarding how supports will be delivered:

> **Legal support.** It is made clear in the *Notice Plan* that neither the administrator nor individuals trained to provide information and mental health support are to provide legal advice to claimants (e.g., p. 4, p. 6). There is no mention of how claimants may be supported in seeking legal counsel during this process. Given documented exploitation of claimants by lawyers in past settlements, it would be helpful to develop resources to help claimants navigate this class action process. Clarification for claimants of the role of class counsel related to their application will be a necessary addition to compensation process materials, especially for individuals who expected to be compensated under a CHRT process.
>
> **Mental health support.** There are a number of ways in which the *Final Compensation Framework* details the provision of mental health support to claimants (e.g., private counselling, at community events, in a family setting, group sessions, 24-hour tele-health or by way of the Compensation Process and Support Line). Prior success of hotlines including a chat function (e.g., the Hope for Wellness Helpline) could be considered, particularly as this is often preferred by youth and individuals less comfortable speaking on the phone. While referrals to services are mentioned, there is less information regarding ensuring these resources are accessible to individuals. For instance, in past compensation schemes, the lack of access to Indigenous healing supports within communities, was seen as a barrier for many claimants. As discussed briefly above, more planning ahead of time to ensure access to supports is warranted. While the *Final Compensation Framework* describes that supports will be funded and provided by Canada (*Notice Plan*, p. 5), it is worth considering more flexible ways in which mental health and well-being supports chosen by individual claimants could be accessed. For example, reimbursements to providers to whom individuals could self-refer could maximize choice in how claimants seek and receive mental health support.
>
> **Administrative support.** There are provisions for administrative support with the application process in which trained phone line operators and Navigators can answer questions (*Notice Plan*, p. 4) and the first-level reviewers of applications can help claimants ensure the application is complete (*Final Compensation Framework*, s. 9.3). The AFN will also provide an Information Line (*Notice Plan*, p. 6) that will provide information according to an agreed upon framework consistent across these informational resources. Caution may be taken in developing multiple areas of administrative support to ensure that this does not lead to conflicting advice.
>
> **Financial support:** The *Final Compensation Framework* notes that the administrator will provide financial literacy information related to receipt of compensation, managing the money, planning for the future, and prevention of exploitation (s. 10.6). There are also provisions in the *Notice Plan* for financial literacy to be offered to claimants before and after receiving compensation through the Aboriginal Financial Officers Association and the Royal Bank of Canada (p. 5). Ensuring that multiple streams of information regarding financial support are consolidated will minimize confusion.

Providing follow up support for both accepted and rejected claims. For claimants who receive compensation, financial literacy information will be provided (see above). There is no explicit mention of other support for beneficiaries, although one could assume that the mental health supports would be ongoing and available, at least throughout the official three-and-a-half-year process. Such supports could be tailored to individuals who are offered compensation. For individuals whose claims are denied, it is not clear what supports will be available. It is stated in the *Final Compensation Framework* that claim denials will be stated in simple language (*Final Compensation Framework*, s. 9.5). Beyond the appeals process, there is no provision of support for denied applications. There is an opportunity to consider the nature and scope of mental health supports to individuals whose claims are denied.

Avoiding repetitive disclosure and triggers during appeals processes. The *Final Compensation Framework* describes a paper application form that would require basic disclosure of experiences relevant to proving eligibility. While the process for appeals is not yet articulated (s. 9.6), there are opportunities to consider mechanisms for appeal that minimize the need for repetitive

disclosure. Further, allowing claimants to choose from multiple options for making an appeal (e.g., written statement, oral statement, supportive proxies) may create space for flexibility that empowers claimants in the process.

Processing claims

Adequate preparation before claims processing begins, including how technology will be used and how payment challenges will be overcome. The *Final Compensation Framework* describes a multi-level process for review of claims, reflecting preparation regarding the general operational framework for processing (ss. 9.3–9.6). Given the shift in the compensation scope, the updated framework and notice plan should reflect the settlement agreement details prior to claims being processed. While the *Final Compensation Framework* describes plans to facilitate payments tailored to specific needs of individuals (s. 2.6), detail is not provided on how this will be done. Given challenges in past settlements related to technology use in processing claims and distributing payments, preparation for application and compensation could anticipate the operational and technical tools that will be used and troubleshoot possible issues before the process goes live.

Accommodating gaps in resources and documentation to move claims forward. As previously noted, there is no clear mechanism for accommodating gaps in information needed to undergird a claim. Preparation ahead of receipt of applications for how gaps in different types of needed information will be addressed (e.g., what may be accepted as a proxy) could considerably expedite claims, reducing delays in processing.

Planning ahead to avoid trauma-insensitive personnel and administrators. The training processes described in the *Final Compensation Framework* and the *Notice Plan* include mention of cultural appropriateness, avoiding revictimization, acknowledgement of the sensitivities of children and youth, and clear understanding of the compensation process itself (e.g., *Final Compensation Framework*, ss. 2.5, 9.3; *Notice Plan*, pp. 4–5). Based on discussions with respondents and our reviews of retraumatization literature and lessons learned from past settlements, personnel training and preparation will benefit from consideration of the trauma-informed principles listed in Trauma-Informed Approaches on p. 127 along with sensitivity to how harms have unintentionally resulted from past compensation processes.

Limiting delays and waiting periods and planning how this will be addressed with claimants and communities when it happens. The provision of resources to agencies (mentioned above) is intended to limit delays in processing applications (s. 5.4). Functionally, while the *Final Compensation Framework* outlines an official three-and-a-half-year application period under the administrator, it provides for ongoing applications after this period. However, while there is mention of expedited processing (s. 9.3), there is no mention of the standard timeframe for processing applications, or how delays will be managed. Given the harmful impact of long waiting periods, efforts could be taken to specify the anticipated processing time, and plan for sensitive communication with individuals whose claims take longer than this and/or is denied.

Conclusion

This report is the culmination of a year-long information gathering process building on the *Taxonomy of Compensation Categories for First Nations Children, Youth and Families related to 2019 CHRT 39*. Our approach was to review the benefits and limitations of administrative data, assess the ability of existing information sources to address the eligibility of the compensation categories delineated in the *2019 CHRT 39* order, and to review existing literature and legal processes helpful to implementing the order. Where possible, our project team has offered commentary and analyses throughout the report about how the specific findings could inform the compensation process. Many of the findings from this report may also help inform the agreements-in-principle (AIP) reached among the parties on December 31, 2021, that could settle the CHRT order along with the two parallel class action lawsuits[1] that have also sought compensation for overlapping classes of individuals.

The compensation process will need to include developing respectful procedures for eligible claimants who (1) self identify as eligible to an administrator and/or (2) are identified through the development of outreach procedures and processes. Both claimant pathways will most certainly involve prolonged and complex engagement among claimants, communities, child welfare agencies on- and off-reserve, Bands, Federal, Provincial, and Territorial governments, and health and social service programs. We conclude our report by summarizing our major findings organized under each of the three sections: 1) the role of administrative data from health, social services, and child welfare settings; 2) data availability; and 3) considerations for the compensation process.

Role of Administrative Data from Health and Social Services Settings

> "Data is inherently political and can help identify priorities, set targets, and hold government accountable. Many First Nations people and communities have experienced data being used for political purposes, but not their own. The content and purposes of data have historically been determined outside of First Nations communities (Otim, 2015), and the misuse of data has led to situations of misappropriation and broken trust." (McBride, n.d., p. 2)

Findings from our review are clear: in order to utilize available administrative data to identify and respond to claimants, the process must respect First Nations sovereignty and data governance, establish respectful relationships with providers of administrative records, take into consideration the origins of the administrative data collection programs, and address issues of ethics, privacy, and confidentiality.

Respect First Nations data sovereignty and governance. Beginning any data-seeking task related to First Nations people should prioritize First Nations data governance principles related to this data. Seeking guidance from communities regarding access to and use of data for decisions made about these communities is inherent to respecting principles of First Nations data governance (FNIGC, 2020; UNDRIP, 2008).

Establish and maintain relationships with providers of administrative records. Establishing and maintaining relationships with providers of administrative records at the beginning and throughout the process ensures: that users of administrative records are aware of any changes that may impact the data being collected (Statistics Canada, 2019, n.p.); constant feedback between the supplier and user of the administrative records regarding any weaknesses found in the data that can help suppliers of the data to improve the quality of the administrative source (Statistics Canada, 2019, n.p.); and an increased level of trust between parties involved (Green et al., 2015, pp. 42–43).

1 *Moushoom, Meawasige, Meawasige v. The Attorney General of Canada, 2019; Assembly of First Nations, Trout v. The Attorney General of Canada, 2020*

Understand the origins of the administrative program. Having a good understanding of the context under which the administrative organization established the administrative program (e.g., legislative framework, objectives, and needs) is critical because it impacts the coverage of administrative records along with the contents, key concepts and definitions, the frequency and timeliness, the quality of the recorded information and stability over time (Statistics Canada, 2019, n.p.). In situations when each province manages its own administrative program, it is important for users of administrative records to pay extra attention to the consistency of key concepts and data quality when there are multiple sources of administrative data (Statistics Canada, 2019, n.p.).

Address ethical, privacy, and confidentiality issues. Ensuring access to administrative files requires that ethical, privacy, and confidentiality issues are addressed very early in the process. This usually involves a thorough understanding of the legal framework governing the use and sharing of administrative data as well as securing of agreements that allow for the use and sharing of the data while minimizing any potential risks to participants (Green et al., 2015, p. 42)

Acknowledge the purpose of administrative records. It is critical to keep in mind the central reason for the existence of administrative records: they were put into place for administrative purposes, typically for the delivery of services to the public. It is unlikely that applications outside their original scope were taken under consideration when they were built (Statistics Canada, 2019, n.p.). Decisions to utilize administrative records must always be preceded by "an assessment of such records in terms of their coverage, content, concepts and definitions, the quality assurance and control procedures put in place by the administrative program to ensure their quality, the frequency of the data, the timeliness in receiving the data and the stability of the program over time" (Statistics Canada, 2019, n.p.).

Data access will need to be negotiated at multiple levels (e.g., agencies, communities, provinces). If the request for compensation is initiated by a claimant, then the consent process for obtaining a record is clear. If eligible claimants are identified before they come forwards, who accesses a potential claimant's record under whose direction, and how outreach is conducted, is more complicated. Thoughtful consideration of these issues of consent, confidentiality, and access are paramount to the compensation process.

Data Availability

Child welfare compensation eligibility

The findings of our review of data availability related to First Nations child welfare involvement show that there are significant gaps in the data available to document eligibility under the child welfare compensation categories. The availability and quality of information is greatly impacted by the decentralized nature of child welfare service provision in Canada. Across administrative systems we reviewed, basic information regarding the identity of the child and dates of placement are typically documented, as this information is tied to payments for placements. More detailed information regarding circumstances of placement, such as why a child was placed, if they were placed outside of their community, the primary caregiver at the time of placement, however, is not consistently available. Data collected by agencies and ISC regions are less available in administrative systems in earlier years because many agencies used paper files before transitioning to a computerized information system.

Even if data fields are available there are many instances where the definition of the field would not correspond to the CHRT eligibility (e.g., placement type). For the purpose of responding to individual claims, administrative data at ISC can be used to confirm some placement history details (e.g., length of time and care and spells in care) but information on moves, on/off reserve, and reason for placement will need to be accessed through agency files. **Unless there is evidence that a caregiver perpetrated physical or sexual abuse that led to an out of home placement, it should be assumed that neglect and/or a lack of access to services was the main driver of the placement decision**. Administrative data fields cannot be used systematically to construct a reasonable understanding for the reason for placement using the child welfare administrative systems assessed for this project.

Our findings regarding information available through the FNCFS program and in sampled child welfare agencies and authorities is not representative of all First Nations child welfare data in Canada. Only the availability and quality of data fields was analyzed by the project team, no data was analyzed, and the findings are descriptive of the information contained in administrative systems based on key informant reports. Despite these limitations, the descriptive findings presented in this report provide an overview of the available child welfare data holdings, which can inform the compensation process in several

meaningful ways. Importantly, this report documents that relying on certain kinds of data could risk excluding many eligible claimants. **While using administrative data can help facilitate and expedite proof of eligibility for compensation, documentation almost certainly does not exist for all eligible children, especially those who were involved in child welfare in earlier years. Looking for alternatives in cases of missing or untraceable information will be necessary and important.**

Jordan's Principle compensation eligibility

Data related to Jordan's Principle compensation eligibility with respect to delays, denials, and gaps in essential services will come from multiple sources at the federal, provincial, and local levels. Prior to 2017, there was no *systematic* data collection although there may be ad hoc systems used in ISC regions that could yield helpful information through a manual archival search. Due to a high level of turnover in Jordan's Principle staff, there is a loss of institutional memory. The most reliable and accessible data pertaining to Jordan's Principle requests are found in more recent years. Beginning in Fiscal Year 2017-2018, a more systematic approach to data collection was implemented to collect detailed information regarding requests, approvals, denials, as well as the date of a request and the date of a response, which can be used as a proxy for delay.
